Michael Hughes (UK)	John M. Wetwood (UK)

CONTENTS

THEME I
TOWARDS THE ENHANCEMENT OF SOCIAL RESPONSIBILITY AND BUSINESS ETHICS: MODERN THEORY AND PRACTICE

SESSION I-1
STAKEHOLDER-ORIENTED MANAGEMENT AND CORPORATE SOCIAL RESPONSIBILITY (CSR)

SESSION I-2
ETHICS AND SOCIAL RESPONSIBILITY IN SPECIFIC INDUSTRIAL CONTEXTS

THEME II
CHALLENGES FOR BUSINESS SECTOR DEVELOPMENT

SESSION II-1
FINANCE PERSPECTIVES IN SMALL AND MEDIUM ENTERPRISES (SMES)

SESSION II-2
SECTOR-SPECIFIC PERSPECTIVES

THEME III
NEW INSIGHTS FOR ECONOMICS AND POLITICAL ECONOMY

SESSION III-1
EU ENLARGEMENT AND ECONOMIC AND REGIONAL DEVELOPMENT

SESSION III-2
THE ROLE OF FOREIGN DIRECT INVESTMENT (FDI) AND PUBLIC SECTOR INSTITUTIONS

FOREWORD

As we near to the modern ages, the pluralist balance of different ideals and traditions we have witnessed in Western culture for most of the period since the Enlightenment seems to be breaking down, perhaps irretrievably. The long-term survival of cohesive communities, effective government power and fruitful social cooperation has been called into question by the growing triumph of globalisation and free-market deregulation, and by the spreading culture of rampant individualism. (Bronk, R., 1998)

The Seventh International Conference "Enterprise in Transition" organized by the Faculty of Economics, University of Split presents 109 papers by more than 150 authors from 24 countries on four continents.

The issues discussed at the Conference are divided into three main themes:
- Towards the enhancement of social responsibility and business ethics: modern theory and practice;
- Challenges for business sector development;
- New insights for economics and political economy.

All the three themes are currently the focal points of interest in economics causing numerous discussions and disputes. Even though it has been lasting for over a decade and a half, the transition process is continually opening new questions which require new research efforts looking for the answers that might have a chance to be unanimously accepted.

How it is possible to achieve a stronger social responsibility and business ethics in conditions of an increasingly spreading consumerism ideology and domination of big business guided by profit as the main principle of efficient entrepreneurship? The obvious discrepancy of these concepts may be seen as a barrier to effective solution mechanisms. Within the positive economics of the neo-classical type, settling these contradictions is impossible in principle. Therefore it seems that we need an interdisciplinary approach, an approach which will use the achievements of other social sciences. Large and expanding differences in development level between countries and within them, environmental threats to our vital resources such as global warming, as well as information, technological and cultural domination of global power centres are dramatically warning that policies proposed either by economics or by market cannot offer adequate solutions. Long ago Joan Robinson warned that *...the professional economist keeps up a smoke screen of "theorems", and "laws" and "pay-offs" that prevent questions such as that why the USA keeps an appreciable proportion of its population in perpetual ignorance and misery from being asked.* In her opinion this situation is inevitable: In every country educational institutions in general and universities in particular, are supported directly or indirectly by the established authorities and whether in Chicago or in Moscow, their first duty is to save pupils from contact with dangerous thoughts. Robinson's argument is still valid. Economic reasoning alone cannot offer a solution for any economic problem, for all involve political, social and human considerations that can not be reduced to *the lore of nicely calculated less and more*. What we need is a different habit of mind - to eschew fudging, to respect facts and to admit ignorance of what we do not know.

The above attitudes determine to some extent the other important topic session of this Conference devoted to the new views in economics and political economy. The discussion arising from the well-known Cambridge controversy needs to be continued and actualized. As

Joan Robinson argued the problem of capital measurement remains open: *"The student of economic theory is taught to write Q=f(L,C) where L is a quantity of labour, C a quantity of capital and Q a rate of output of commodities. He is instructed to assume all workers alike, and to measure L in man-hours of labour; he is told something about the index-number problem involved in choosing a unit of output; and then he is hurried up to the next question, in the hope that he will forget to ask in what units C is measured. Before ever he does ask, he has become a professor, and so sloppy habits of thought are handed on from one generation to the next".* I sincerely hope that the Conference presentations and discussions will address the question of scientific and professional responsibility for the problems surrounding us which may primarily be defined as economic-political problems.

Besides the expected scientific contribution, the Conference will offer an opportunity to its participants to socialize and continue building their relationships. The sea and sunshine at Bol will create an enticing setting for discourses of various kinds. May openness and friendship be the "trade mark" of this Conference to contribute to the realization of our mission which is welfare for people all around the world. Intellectual and critical vigour is what we need to try to come closer to desired changes.

Split, April 2007

New theories of growth are already knocking on the door and will soon come into play. Keynes policy choices had been updated and better interpreted by the neo-classical school; Milton Friedman has been rather quickly forgotten; Solow and his school is now undergoing a metamorphosis towards new growth theories, in which the traditional, well-known equation of the equilibrium in internal and external markets and the function of production used in the university text books is under questioning, with the proposal of deep revision and integration. This presentation intends to focus on some aspects that are becoming challenging issues for economy, finance and governance in a transnational environment which is already prevailing over any former endowment of factors, output, institutional conditionality, business cycle, flows of capital, external exogenous variables.

We need some formal but simplified equations to show the results. The fact is that we are assisting, also in the research field, at the innovation effect of new quantitative tools and improved statistical methodologies. Also the set of data are more reliable for the majority of the countries world wide and in any case for the more relevant ones. Political and Social factors, through appropriate indexing and proxies, could approach the effective, real relevance of each single variable. Public and private choices, in this stage, are more and more supported by methodological and decision making instruments of analyses.

Let us start from the production function in the Solow model:

**Production function
in the Solow model:**

$$Y_t = K_t^{\alpha} \cdot (A_t \cdot L_t)^{1-\alpha}$$

It could easily become

**Production function in the
Mankiw/Romer/Weil model:**

$$Y_t = K_t^{\alpha} \cdot H_t^{\beta} \cdot (\widetilde{A}_t \cdot L_t)^{1-\alpha-\beta}$$

But soon afterwards we could arrive at the most recent new step forward taken by the Research Unit of the Deutsche Bank, and its Chief Economist Norbert Walter, where the equation becomes more close to the complexity but also to the correspondence of the process of growth nowadays:

**Production function
in *Formel-G*:**

$$Y_t = K_t^{\alpha} \cdot H_t^{\beta} \cdot (P_t \cdot \hat{A}_t \cdot L_t)^{1-\alpha-\beta}$$

I need to add some short explanations of the relevance of these crucial variables for growth, because particularly Europe, its transition countries and Asia's main players will soon face the conditionality of the many other variables that these incorporate and transform into the true drivers of the future developments, where the FDIs play a major role if well managed both by the investors and the hosting countries, a real business-government relations. I quote the analyses prepared by Stefan Bergheim, in a joint project with Jan Hofmann, Marco Neuhaus and Ingo Rollwagen of the Research Unit of the Deutsche Bank and a recent brain-storming with Gregorio De Felice, Chief Economist of the Italian Banca Intesa, one of the leading European banks.

FROM WISHFUL THINKING TO STRUCTURAL MODELS

The lacking aspects of the previous Growth theories were characterized by the absence of consistent quantitative and rigorous models. It is really from this need that the before mentioned researchers of the DB Chief Economist Unit moved their steps with the Foresight Model for Evaluating Long-term Growth-FORMEL-G new conceptual modelling approach. The outcome of their analyses, accompanied by a large econometric elaboration, represents a real tool for the applied macroeconomic and policy choices. Let's follow the crucial passage of the model. *Growth forecasts must have a solid theoretical foundation. The basis of most growth analyses is the neoclassical production function in which output Y is a function of labour input L, capital input K and the level of technology A (Solow residual; usually called "total factor productivity"). Growth decompositions divide actual growth into these three components. However, over the long-term, the sole driver of any growth of per capita output is the progress of technology A. It also is crucial for long-term increase in capital stock per*

capita. Therefore, forecasts of economic growth with the help of simple growth decompositions require more or less arbitrary assumptions on technological progress.

They do not explain the really interesting variable A, but bury it in an assumption. Therefore, simple growth decompositions are not suitable for forecasting. The often-assumed absolute convergence of income levels between countries (i.e. poor countries' GDP grows faster than that of rich countries) also lacks theoretical and empirical support. There is no automatism: higher income levels do not fall from heaven like manna but require hard work.

The GDP of a country only converges to the country-specific income level that is determined by that country's growth drivers. Therefore, any useful model of the future has to explain technological progress. This is easier said than done, however. Mankiw/Romer/Weil made a path-breaking contribution in 1992 by incorporating human capital H as a measure for the quality of labour input into the empirical growth analysis. Human capital describes a person's ability to produce output efficiently and to develop new products. This important additional variable helped significantly in explaining historic income differences across countries.

For empirical growth analysis, this has been a great step forward, but not yet fully satisfactory. Both the theoretical and empirical work of the last ten years has tried to model the remaining, unexplained share of technological change after human capital is taken into consideration. The objective is to explain economic growth as fully as possible in the model by incorporating a further policy variable P (or several variables).

Exogenous, unexplainable influences are to be minimised. The search for P has given rise to a flourishing literature dealing with the role of politics, institutions, knowledge and innovation. In their overview, Durlauf, Johnson and Temple (2004) identify 42 "growth theories" using a total of 102 variables – which may be combined in different variations. Although theory does not produce a clear conclusion regarding the "correct" growth model (the "correct" P), it helps us identify potential growth drivers. The decision as to which additional variables really have a statistically and economically significant link with growth will have to be based on econometric analysis.

We are assisting, it appears already very well established, to the blossoming of a third generation theory of Growth, as Paul Romer, its brilliant inspirer, describes in "The Concise Encyclopedia of Economics": "Economic growth occurs whenever people take resources and rearrange them in ways that are more valuable. A useful metaphor for production in an economy comes from the kitchen. To create valuable final products, we mix inexpensive ingredients together according to a recipe. The cooking one can do is limited by the supply of ingredients, and most cooking in the economy produces undesirable side effects. If economic growth could be achieved only by doing more and more of the same kind of cooking, we would eventually run out of raw materials and suffer from unacceptable levels of pollution and nuisance. Human history teaches us, however, that economic growth springs from better recipes, not just from more cooking. New recipes generally produce fewer unpleasant side effects and generate more economic value per unit of raw material".

Scholars and researcher are wondering if the so called "new theories of growths" are matured enough to be already defined as a "robust", testable frame for applied analyses and quantitative measurements and reliable forecasts. In other word, are we in front of the same wine into two different barrels or two different wines independently from the barrels we use.

Is than neo-classical theories suffering a fatal process of obsolescence in its applied capability to explain growth and world wide governance?

We might say that at least the new improvements grown over and around the formal Solow model and endogenously principles and approaches are still basic assumptions but take, for instance, the decreasing factors return or the absolute or conditional convergence postulate. For the factor return, we could take the example of technology. The decreasing of endogenous levels of this factor, on the base of the physic principle, is largely overcome by the extraordinary potentiality of innovation to continuously modify and up grade existing technologies, bringing equal to 1 or even more, the differential among performances of the same technologies in different time units: one semester, one year, one quarter, depending on the kind of industrial or services sectoral requirements. In other words, innovation that is produced firstly by human capital and higher research, keeps the levels of technological progress much higher than was previously imagined only twenty years ago. Comes back the Keynesian consideration that technologies are de facto more exogenous while innovation is the real, determinant endogenous factor.

Finally, regional approach intervenes to complete the picture of the new theories of growth. Even if in the drivers and cluster before mentioned I did not reserve a specific relevance to this aspect, the interrelation between the global dimension of the growth challenges and the regional optimal dimensions of its success stories is clear. The correlation between growth and regional dimension has been deeply analysed by Alberto Alesina and Dani Rodrik, in "Distributive Politics and Economic Growth", where the authors studied the relationship between politics and economic growth in a simple model of endogenous growth with distributive conflict among agents endowed with varying capital/labor shares. They establish several results regarding the factor ownership of the median individual and the level of taxation, redistribution, and growth. Policies that maximize growth are optimal only for a government that cares solely about pure "capitalists'" The greater the inequality of wealth and income, the higher the rate of taxation and the lower growth. The Authors present empirical results that show that inequality in land and income ownership is negatively correlated with subsequent economic growth. And even before, Olivier Jean Blanchard and Danny Quah in "The Dynamic Effects of Aggregate Demand and Supply Disturbances" examined the macroeconomic effects of Technology, Employment and the Business Cycle, wondering if the Technology Shocks explain aggregate fluctuations at international and regional level, as well as in Robert J. Barro and Silvana Tenreyro "Closed and Open Economy Models of Business Cycles with Marked Up and Sticky Prices".

CIVIL SOCIETY AND INSTITUTIONAL CHANGE: THE GREAT TRANSITION

More than a decade after the start of economic and political reforms in the formerly communist countries, the economic and political outcomes are very diverse. On the one hand, the countries of Central Europe and the Baltics were able, for the most part, to stabilize their economies after a few years of output fall and to recover their pre-1989 output level. On the other hand, the countries of the former Soviet Union experienced a much more severe and protracted output fall and have not yet recovered their pre-transition output level, despite strong recent growth. Countries from former Yugoslavia are in a similar situation. The experience with political developments is similar. Some countries, mostly those in Central Europe and the Baltics, quickly introduced democracy and political freedom and stabilized their democracies. Former Yugoslavia went through a horrible war experience before some democratic stabilization could be observed. In contrast, most countries of the former Soviet Union went through a period of limited democratization but then drifted towards autocratic rule.

These massive divergences have been one of the prime subjects of the transition literature. There is by now a clear consensus that differences in economic policies alone (speed and sequencing of reforms, type of privatization policies, conduct of stabilization policies, etc..) cannot explain these divergences well and that differences in the institutional setups provide a better explanation (see e.g. Johnson, McMillan and Woodruff, 1999). However, how do we explain the differences in the institutional evolution in different countries? Taking institutions as exogenous cannot be a satisfactory answer as all transition countries have been undergoing rapid and profound institutional change following the end of communism.

Various explanations for the institutional divergence in Central and Eastern Europe have been proposed relying on geopolitical and accession effects. Surprisingly, a potentially important causal channel has been neglected, certainly in the economics literature: differences in civil society development prior to the fall of communism. An argument can indeed be made that civil society development prior to transition may explain important differences in institutional choices which in turn may have consequences on the economy and further institutional developments. In countries with a more active civil society, demand for democracy was certainly stronger than in countries where civil society developments were weaker. When communism collapsed, existing associations of citizens were more prepared to participate actively in the design of the new democracies and to make sure an adequate system of checks and balances was put in place. In contrast, in countries where citizens were less organized and

active, members from the former elite had more of a free hand to establish regimes that would allocate them to concentrate in their hands large powers in an unfettered way. A striking comparison that immediately comes to mind is that between Poland and Russia. Poland had seen the development of Solidarnosc, the famous trade union that organized not only strikes but also many political protests against the communist regime. Members of Solidarnosc played a very important role in the first free elections in Poland in 1989 and in the subsequent political and economic transition. The Catholic church remained very powerful in Poland during the decades of communism and many other associations developed that were independent from the communist regime and mostly opposed to it. Russia had its courageous dissidents like nuclear physicist Andrei Sakharov and many others but Russian civil society was weaker than in Poland. When communism collapsed after the failed putsch in 1992 in the Soviet Union, Eltsin and his entourage immediately seized power and there were no strong demands from citizen associations to engage in a large-scale process of constitutional design for Russia. The president of Russia concentrated strong powers in his hands without facing much protest apart from the former communists who had lost power. While the difference between Poland and Russia is indeed striking, it is a priori not clear whether it can be documented beyond anecdotal evidence or even generalized to all transition countries.

This is precisely what we attempt to do in this research (joint with L. Bruszt, N. Campos and J. Fidrmuc). We use a new, unique data set covering the period between the start of Glasnost and the fall of communism (i.e., from 1985 to 1989) for the 27 former centrally planned economies of Central and Eastern Europe and Central Asia. The data collected from the Open Society Archives in Budapest inform on various aspects of political opposition events. These events were reported by Radio Free Europe and other news sources that specialized in reporting on dissident activities. Our database contains quantitative as well as qualitative information on type of events (strike, demonstration, etc.), number of participants, motivation, and whether and how violently the government reacted. While these data obviously only measure very partially civil society developments, they nevertheless have several advantages. First of all, they measure some of the most relevant data relative to what we are interested in, namely the level of dissident activity. Indeed, we expect a stronger level of initial dissident activity to be associated with stronger citizen involvement in the shaping of the new democratic institutions and thus with stronger checks and balances. A second advantage of our data is that they make the cross-country comparison easier and more meaningful. Much of civil society development is country-specific and difficult to compare. Religious associations may be more developed in one country but in another it may be youth or sport associations and these are not directly comparable whereas levels of dissident activity can be more easily compared.

We find that political opposition before 1989 was much more intense in Central Europe than in the Soviet republics. This is true even for countries like Czechoslovakia where the regime was more repressive than in Poland or Hungary. Closely related to a lower level of dissident activity in the Former Soviet Union is a higher rate of repression of dissident activity. Not only the probability of government reaction was higher in the latter, but so was the probability that the government reaction was violent.

Differences in civil society development in the eighties play an important role in explaining whether the country adopts a parliamentary or a presidential regime.

Key words: *Higher education, Croatia, stakeholder management, multiple constituencies*

Abstract

This paper is based upon the assumption that the social responsibility of institutions within the system of higher education (HE) should be recognized by transparent and consistent treatment of all their stakeholders. In order to provide evidence(s) related to the socially responsible behavior of actors in the Croatian HE sector, the review of relevant theoretical background is provided and discussed. Seminal works and authors are used to: (a) establish the 'benchmarks' for the Croatian context and (b) define the empirical research framework required to investigate the main components of the 'best' socially responsible practice. The resulting discussion of empirical results is focused on the managerial practices of the contemporary Croatian HE institutions, as related to the 'subject-specific' orientation towards relevant individual/collective stakeholders as actors in the HE process(es).

1. BASIC DETERMINANTS OF THE STAKEHOLDER CONCEPT

The expression «stakeholder» is first mentioned in 1932, although the underlying concepts started evolving after the publishing of the seminal book *«Strategic Management: A Stakeholder Approach»[1]*, which positioned the stakeholder concept as a potential answer to the threats from the business environment of the 1980s. In this context, a company/organization has a wide range of responsibilities, which are represented by the legitimate interests of different stakeholders, which made it easy to associate it with the CSR (corporate social responsibility) concept as soon as it was introduced. However, the

---

[1] Freeman, R. E.: **Strategic Management: A Stakeholder Approach**, 1984., as quoted in Friedman, A.L., Miles, S.: **Stakeholders: Theory and Practice**, Oxford University Press, 2006. p. X

descriptive precision, instrumental power and regulative values could be cited as significant strengths of the stakeholder theory, considering that[2]:

- It explains the manner in which managers and stakeholders really behave and the way they see their activities and roles **(descriptive);**
- It prescribes how managers should behave, if they want to improve their own interest i.e. interests of organization, generally seen as long-term profit maximization or maximization of value for stakeholders (**instrumental**);
- The theory relies on the following ideas: (1) Stakeholders are individuals and groups with reasonable interest in procedural and/or vital aspects of company activity. Stakeholders are defined by *their* interest in company, regardless companies interest in their functional interest for *them*. (2) Interests of all stakeholders have an intrinsic value, i.e. each group of stakeholders deserves to be taken into consideration because of its intrinsic (human) values, instead of its capability of improving outcomes significant for other groups of stakeholders, for example, shareholders (**regulative);**
- **Stakeholder-oriented management** requires that the justified stakeholder interests are taken into account in all relevant situations, as described by the fundamental principles of stakeholder management (Table 1).

Table 1. Principles of «stakeholder» management

Principle 1	Managers should **acknowledge** and actively **monitor** interest of all reasonable (legitimate) stakeholders, and take them into consideration while deciding and acting
Principle 2	Managers should **listen** and openly **communicate** with stakeholders about their individual interests and preferences, and about risks with whom they are confronting because of connection with company.
Principle 3	Managers should **adopt** processes and behaviors sensitive on interests and competence/ opportunities of every single stakeholder.
Principle 4	Managers should be able to **identify mutual dependence** of efforts and prizes within stakeholders, and should try properly share companies privileges/benefits and burden considering the proper risk and vulnerability.
Principle 5	Managers should **cooperate** with other entities, whether they are public or private, to ensure that risks and damages from activities of company are minimized and compensated where they are inevitable.
Principle 6	Managers should **completely avoid** activities that could endanger inalienable human rights (e.g. right to live), or encourage risks that are obviously unacceptable to important stakeholders.
Principle 7	Managers should **admit possible conflicts** between a) personal role as stakeholder of company and b) its own legal and moral responsibility towards interests of stakeholders, and should approach to that conflict through open communication, adequate statements, stimulating systems, and where it is needed through reviews of third parties.

Source: The Clarkson Center for Business Ethics (1994: 4) as quoted in Friedman, A.L., Miles, S.: **Stakeholders: Theory and Practice**, Oxford University Press, 2006, p. 151

First definitions of stakeholders were organizationally driven. E.g., the Research institute of Stanford defined a stakeholder as a *«group without whose support organization would stop to exist»[3]*. However, within a wider – and a more contemporary – context, the stakeholder can be viewed either as an individual, or a group, which can influence the functioning of an organization, which – in turn - acknowledges the entity as a stakeholder[4]. Therefore, the

---

[2] Donaldson, T., Preston, L.E.: «The Stakeholder Theory of the Corporation: Concepts, Evidence, and Implications», **Academy of Management Review**, Vol. 20, No. 1, 1995., p. 66-67

[3] Friedman, A.L., Miles, S.: op.cit., p. 5

[4] Friedman, A.L., Miles, S.: op.cit., p. 5-21

stakeholder is *«any individual or group that can influence or can be driven by achieving goals of organization»*[5], with the organizations perceived as grouping(s) of stakeholders, with the purpose of managing their interests, needs and views.

Therefore, the crucial question is whether the role of stakeholders should be limited to those who are the most important for achieving goals of organization, or could be simply applied to each subject influenced by an organization. In this context, it is important differentiate between all subjects that have a certain influence and «true» stakeholders. Some subjects can be included in both categories (big investors), some can be recognized as stakeholders, but they might not have a significant influence to the organization (candidates for job), while others could significantly influence the organization, without internal participation (such as media)[6].

2. BASIC THEORETICAL DETERMINANTS OF MANAGING RELATIONS WITH STAKEHOLDERS

2.1. Social orientation and organizational responsibility

Social orientation of an organization (company) is related to the development of the stakeholder theory, as well as the concern in balancing numerous interests of different stakeholders. With development of such a responsibility and pressure of society, three solutions are suggested (market competition, legal sanctions and social responsibility of company)[7] as mechanisms that could control the businesses from violating moral and ethic codes in persuasion of profit.

Social responsibility, at the other hand, consists of service to the public and maintaining public goods and, therefore, can be traced as one of sources for development of the stakeholder theory. It is of specific importance for the nonprofit organizations, as their mission and the very existence are tightly connected to the successful management of stakeholder relations. The nonprofits work in a complex environment, with their activities focused toward a larger number of target groups (publics), instead toward a well-defined target group (which is the case for the profit oriented organizations). Therefore, the nonprofit activities are best comprehended within the context of the stakeholder model, which perceives an organization as an open system, composed by many subjects (besides founders/ proprietors of organization, and other insiders), who have legitimate requests towards organization and its performance[8].

Nonprofit sector, beside the two most important subjects whose needs need to be met – actual users (who consume the products/services of an organization) and donors (providing the necessary resources) – needs to manage relations with many other subjects. Different importance is attached to each of those, according to the type of the organization, its mission and goals, as well as other specific features. Such an organization could be considered as

[6] Donaldson, T., Preston, L.E.: op. cit., p. 86

[7] Friedman, A.L., Miles, S.: op.cit., p. 20-21

[8] Hinterhuber, H.H. - Krauthammer, E.: «The leadership wheel: the tasks entrepreneurs and senior executives cannot delegate», 1999., as quoted in Trim, P.R.J.: «Strategic marketing of further and higher educational institutions: partnership arrangements and centres of entrepreneurship», **International Journal of Educational Management**; Vol. 17, No. 2, 2003., p. 59

effective if it meets its (pre)determined goals (as defined by the «classic» management theory)[9], although many new studies[10] emphasize **managing relations with stakeholders as a basis of organization efficiency,** especially in concern to their dependence towards donors in achievement of its mission. Significant tasks in managing relations with stakeholders for the nonprofit organizations are: (1) interpretation of stakeholders' expectations and (2) balancing their convenience to values and mission of organization, professional norms of the executive authority and the own interpretation of public good. As a consequence, executives of nonprofit organizations keep certain discretion of way they relations with the stakeholders are managed[11]. It is also important to link organizational values to relations with external subjects. Values which institution emphasizes, as well as goals toward it strives, influence the strength of relations with different partners and the emergence of an adequate fit with values and goals of external stakeholders. Such a fit influences the organizational behavior, which is – in turn – significant for the further development and maintenance of those relations, which are – once again – crucial for obtaining financial support[12]. Consequently, a well designed alignment of values can lead to a virtuous circle of success, both for a nonprofit organization, as well as for its stakeholders.

At the other hand, stakeholders represent a source of insecurity for a nonprofit organization because it requires assets and other forms of commitment from the stakeholders. Considering that stakeholders define their relations with a nonprofit on the basis of the level in which their expectations are met and the manner in which they are treated[13], the stakeholder relations require a careful approach to managing relationship(s) with individual stakeholders. **Action and response** of organization can be problematic when multiple stakeholder groups have changeable and sometimes conflicting expectations from am organization.

In core of **responsibility and organizational response (to stakeholders)** is the awareness that the role of an organization should not be limited to reacting to the environment, but should be rather proactive, which translates to balancing response(s) to individual stakeholders, within the limitations set by the existing resources and the perception of what is the appropriate action to be taken. Strategic management of stakeholders implicates not only response to them, but also guiding their expectation(s). If those are balanced with the values, tasks and competences of a nonprofit, the organization will be noticed and perceived as serving the needs of stakeholders and the entire public, i.e. perceived as efficient and responsible[14].

The other mechanism which influences the *perception of responsibility* is the **principle of consistence** in treating different stakeholders[15]. Consistency increases predictability of non-profit organizations and reduces lack of stakeholder confidence regarding the organization, making it easy to predict the dynamics of the interactions with the organization. However, the consistence should not be contradicted to the interests of a wider community, as well as it

does not suggest that the stakeholders perceptions are manipulated, in order to avoid the fulfillment of social interest/own social responsibility. Consistent treatment of stakeholders implies the coherent behavior toward each of them, which recognizes the specific interests of multiple constituencies[16] as approximation of the society in general.

Orientation toward stakeholders/clients as a part of corporate culture implies that those are considered to be placed at the top of the hierarchy, as illustrated by Figure 1. Such an approach allows all members of the organized to be focused on client satisfaction, while the managers are expected to help employees provide value for the clients[17].

2.2. Social orientation and multiple constituency approach to social responsibility in non-profit sector

The concepts of **social orientation** and the **implementation of marketing concept in non-profit organizations** are believed to be (inter)connected[18]. Namely, the idea of social orientation starts from the assumption that the main task of an organization is to define needs, desires and interests of clients/customers and to ensure that, by satisfying these requirements, the benefit and the long-term interests of clients/customers and society are preserved or increased[19]. Figure 2. illustrates the components of the social orientation.

Through certain **antecedents,** social **orientation of an organization** is formed. Its output is the creation of certain **organizational benefits,** which produce the **social benefits** as a

consequence[20]. First component, as one of specificities of the nonprofit sector is the *orientation towards stakeholders*. Namely, the presence of multiple constituencies is the defining attribute of the nonprofit sector, as well as organizational dependence on a larger number of constituencies/stakeholders, with the needs of a single group of stakeholders being less dominant than in the profit sector. Therefore, it can be expected that the *higher level of orientation towards stakeholders leads to a higher level of social orientation and responsibility*.

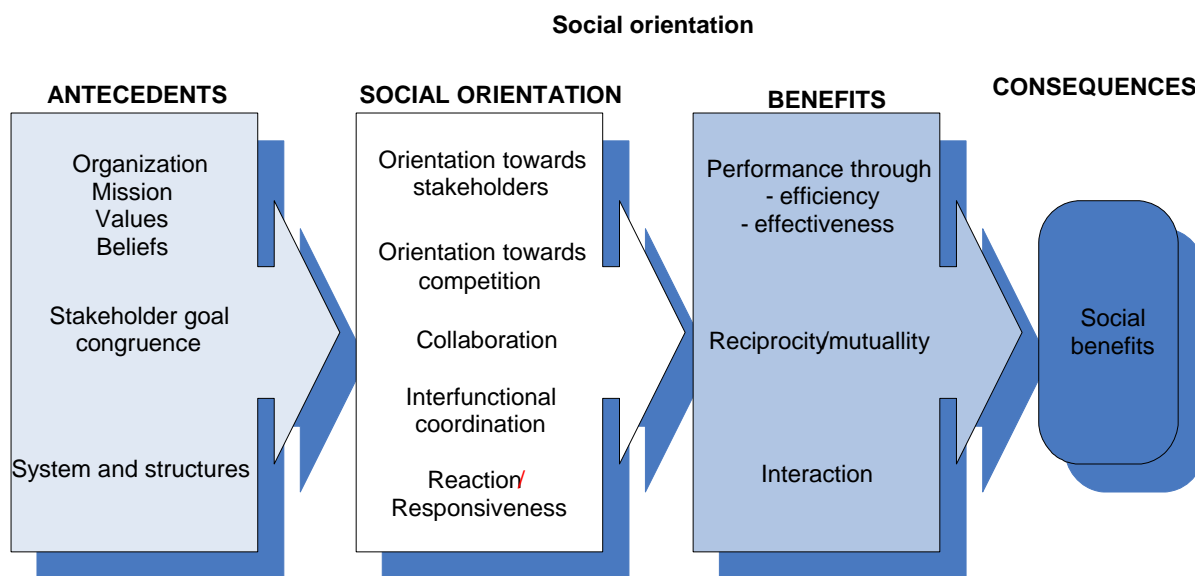
Social orientation


Figure 2. Social orientation construct

Source: Sargeant, A., Foreman, S., Liao, Mei-Na: „Operationalizing the Marketing Concept in the Nonprofit Sector», **Journal of Nonprofit & Public Sector Marketing**, Vol. 10, No. 2, 2002, p. 49

The successfully applied social orientation creates certain **benefits at the organizational level** (such as the organizational performance, reciprocity and interaction with stakeholders), which lead towards the **benefits for the society at large.** Although the end benefits can not be defined as easy as in the case of the profit sector, the context of evaluating the socially responsible behavior and its outcomes for the society can be practically developed within the theory of **multiple constituencies/stakeholders.** It claims that nonprofit organizations have multiple monetary and non-monetary exchange relations with *multiple social groups (constituencies/stakeholders),* which differs significantly from bilateral exchange relations found in the profit sector (i.e. exchanges of products/services with the paying customers)[21]. These *multiple stakeholders* include clients, donors, volunteers, board members, employees, etc. who - probably - have different goals and requests, which contribute to potential differences in their interests and expectations[22]. Multiple constituency model, therefore, acknowledges the existence of different criteria in evaluation of the effectiveness of a

10

nonprofit organization, which can be accepted as a complex, but extremely realistic approach to understanding the nonprofits and their effectiveness[23].

Another important aspect of the *multiple constituency model* is that nonprofit organizations should develop and implement *different and independent strategies for individual constituencies/stakeholders.* This implies that the **social orientation should be «subject-specific»,** as individual social subjects have different interests and needs and demand a different kind of dynamics and relationships with an organization. In this context, it can not be expected that a nonprofit shall simultaneously demonstrate the same level of social orientation towards all subjects or express the same intensity of relationship with each of its stakeholders. Moreover, it can be realistically expected that the «typical» organization demonstrates a different levels of orientation towards different subjects simultaneously. Namely, allocation of efforts (and resources) towards different stakeholders inevitably burdens the organization, which often responds by concentrating its efforts toward the subject(s) it considers to be the most important. Although nonprofit organizations depend on donors and other subjects who provide financial resources, they are trying to balance their financial and non-financial goals[24].

From the behavioral point of view, it is crucial to identify the activities that must be taken within the organization   , in order to enact the social orientation, either toward a single, or multiple constituencies. As suggested by Kohli and Jaworski[25], a market oriented for-profit organization needs to focus its activities toward the target market. The same framework can be also applied to the implementation of marketing/social orientation in nonprofit organizations. These activities can be classified according to three dimensions[26]:

- collection of market related information *(Intelligence Generation),*

- allocation of such information within the organization *(Intelligence Dissemination),*

- encouragement of actions/responses, directed towards satisfaction of clients/users, donors and other relevant stakeholders *(Responsiveness).*

In the context of this research project, it is important to determine whether specific forms of social orientation are more important for the higher education (HE) as a part of the nonprofit sector, which are the significant stakeholders for the institutions of HE, as well as what is the existing level of marketing/social orientation toward individual stakeholders and how much it affects the performance of HE institutions. This is especially important for institutions of Croatian higher education, as the nonprofit status of the field is being questioned, the amount of private institutions of higher education increases and the challenges of the Bologna process and new international competition are mounting.

2.3. Specifics of multiple constituency model in higher education

Each educational institution nurtures relationships with different constituencies/stakeholders. The institutions of higher education (HE) can not adequately manage them, as most of them often do not recognize who are their stakeholders, what is their importance, how they contribute to the institution and the higher education in general, as well as who of them reaps the benefits from the HE processes. As previously defined, the *stakeholders of higher education* can be identified as social groups which do (or could) demonstrate a particular interest and/or those which do (or could) influence the functioning of an institution of HE. In this context, it is critical to exactly define the relevant stakeholders, relations with them and multiple roles that certain stakeholders perform.

In higher education, the usage of **systematic approach** is being advocated[27], as a comprehensive approach to all relevant stakeholders, based on the holistic understanding of the educational process. Such a concept identifies three subsystems, which can be compared to the traditional partition of an organization's environment[28]: (1) the academic institution; (2) the related social systems and (3) the environment. The institution of higher education includes professors, students, administrators, support personnel, physical infrastructure, etc. It is surrounded by the interacting elements of the related social systems, and entities, including secondary education, employers, suppliers of goods and services, alumni and potential students, etc. The general/external environment only has an indirect influence on higher education, as it represents the government, profit sector, wider community, etc.

Therefore, according to their relative influence, the stakeholders could be also divided into the three wide categories[29], although the perception of «typical» stakeholders depends on the specific features of the HE institution itself, as well as the domain of higher education in which the institution is positioned, characteristics of the national educational system, level of national development, etc. On the basis of the previous theoretical discussions and the empirical research, the «typical» stakeholders of a higher education institution, are identified and illustrated by Figure 3.

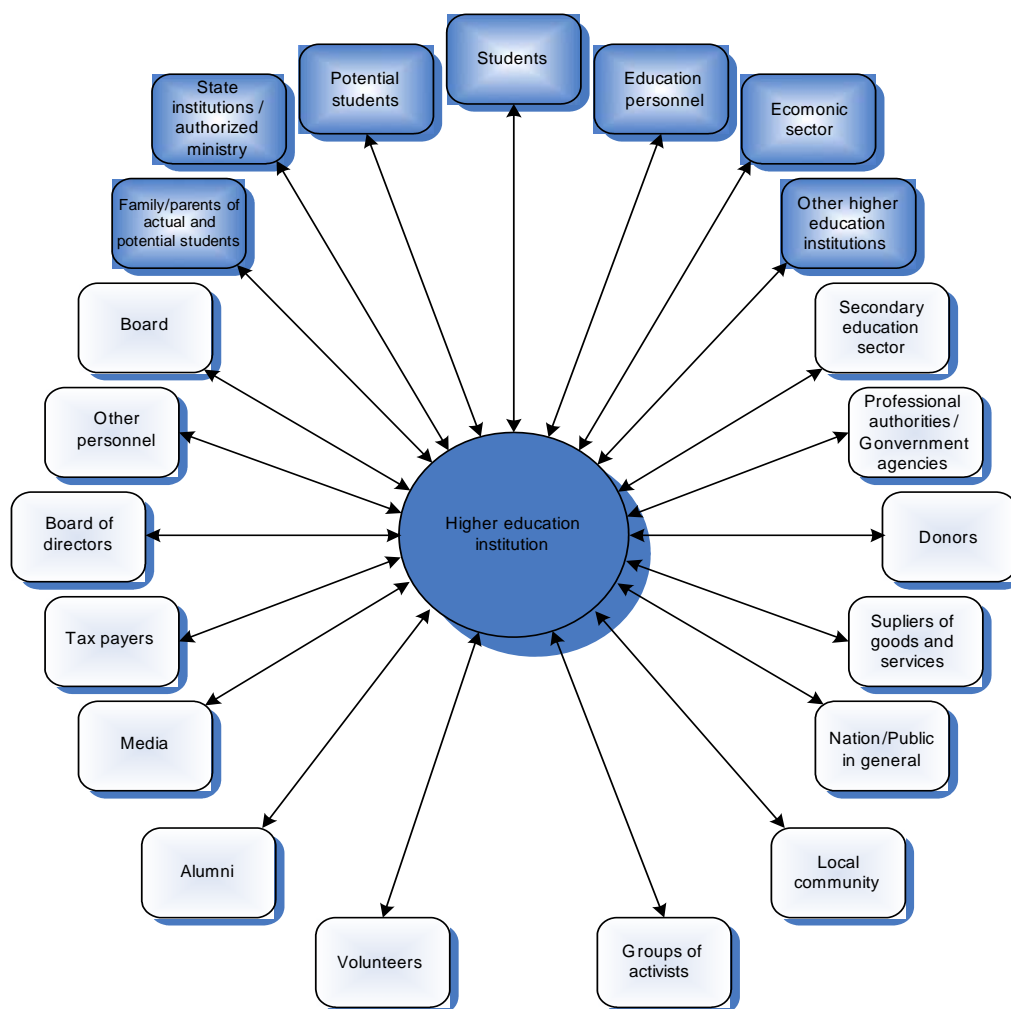
[29] Reavill, L.R.P.: op. cit., p. 58


Figure 3. Map of higher education institution stakeholders

Adapted from: Kotler, P., Fox, K.F.A.: op. cit., pp. 20-26; Reavill, L.R.P.: op. cit., 1998, pp. 58-60; Friedman, A.L., Miles, S.: op. cit., pp. 13-15 and 25-28

It is important to note that a single stakeholder within the HE context may take multiple roles, as well as that the borders among the individual stakeholders may be blurred, or might not even exist. In addition, although the following model will be used as a starting point for the empirical research, many of the «generic» stakeholders do not play an important role within the Croatian higher education sector, as discussed in the following section.

3. THE CROATIAN HIGHER EDUCATION SYSTEM

In Republic of Croatia, there are currently 103 institutions of higher education, including universities with its components, public polytechnics, public schools of professional higher education, private polytechnics and private schools of professional higher education. In these institutions, in the academic year of 2002/2003, there were 121.722 students enrolled, which has increased to the enrollment of 126.322 students in the next academic year, while in the academic year of 2004/2005 the enrollment further increased and reached 134.986 students[30].

---

[30] xxx: Education 2005./2006. (Statistical data), Republic of Croatia – Central bureau of statistics 2006., p. 35

In both tracks (university level and professional level) of higher education, students enroll either with the financial assistance of the Ministry of science, education and sports, or pay the academic fees themselves (in case they have not qualified for the quota financed by the ministry). However, the academic fee and the enrollment quotas are regulated for the public (state-owned) universities, while the new, privately-owned institutions of HE do not meet such a high level of government regulation. Regarding the number of inhabitants, number of students in Croatia is one of the lowest in Europe.

System of higher education is administered by the Ministry of science, education and sports, along with the other administrative institutions, formed either by the ministry, or by the universities/schools. On national level, these include - National council for higher education, Rectors' conference, rectors of Croatian polytechnics; on the level of universities - university senates, in which deans of all faculties/schools are represented; on the level of faculties/schools – individual deans and faculty councils, consisting of representatives of all professors tenured and tracked for tenure, as well as of members representing students and assistants. Unions of employees in science and educational, as well as students' organizations also have a little, or a corrective role in the system.

Public (state-owned) HE institutions are mostly financed directly from the budget through Ministry of science, education and sports, which provides monthly financial contributions to state-owned institutions, for wages of professors, associates and other personnel, as well as resources for material costs, current maintenance and capital investment.

The system of higher education in Croatia is supposed to have two important roles[31]. The first is to *increase the human capital and resources* through the growth of highly educated population, as manifested by the growth of the amount of students in the population of the developed countries. In this context, it is important to note the existence of a large gap: for instance, the EU has the amount of 17 percent of highly educated population, which is almost twice as much as in Croatia. However, emphasis should not be placed on the insufficient growth of the educational capacity, bur rather on its insufficient quality and effectiveness. Arguments for such a statement can be found in the unusually long average duration of study (in average, 7 years) and low efficiency of high education (considering that, in average, each third student enrolled graduates at all). The second important role of the system of HE should be the *fundamental education of future scientists*.

Regarding the requirements of the knowledge society, which accent the flexibility, interdisciplinary, creativity and lifelong education for science, the Croatian system of HE can be evaluated as inappropriate. Although there are individual institutions, programs and human resources of exceptional quality, a recent study states that the Croatian system of HE is conceptually and methodologically outdated, as well as inert or even unwilling to change[32]. Many (potential) reason could be cited: absence of development vision, insufficient investment in area capacity, science and technical equipment of higher education, age structure of professors, a complete absence or a low level of quality control, extremely small number of programs available in English language, low interest for commercialization and involvement in knowledge market, etc. Many of these shortcomings have been addressed by the recent operative plan of strategic development of science in Republic of Croatia[33].

[32] Ibidem., p. 19-20
[33] Ibidem, p. 44-51

14

According to another study related to introduction of quality systems in the Croatian higher education institutions[34], majority does not possess an ISO certificate, nor do they demonstrate practical acceptance of importance of quality in higher education. It is also questionable whether quotas of enrollment in Croatian higher education institutions are actually based on research of future needs of economy and society and whether they contribute to the goal of continuous development/lifelong learning. On the other hand, demands for increased quality of education and teaching in small and interactive groups, inherent to the Bologna process, imply the need to increase the number of employees. From 2003 until 2006, there has been an increased employment in the higher education institutions, but the unplanned process of adding academic staff does not follow the increased number of students and demands of the Bologna process.

One of important steps leading toward the integration of universities is the introduction of new model of financing higher education institutions, so called *lump sum* model. First element of this model is being applied since January 2006, with the new way of financing providing universities (instead of individual schools) with autonomy in control of resources provided by the state budget. According to the existing law, Croatian universities should be totally integrated no later than beginning of 2008, although it is still not clear how the whole process will develop and how the potential conflicts between components of individual universities will be solved. Gradual opening of more privately-owned institutions of HE (representing the «for-profit» section of the sector) and opening of international education market through Bologna process represents new challenges to the Croatian higher education sector.

4. MULTIPLE CONSTITUENCY APPROACH TO SOCIALLY RESPONSIBLE MANAGEMENT OF CROATIAN INSTITUTIONS OF HIGHER EDUCATION

4.1. Fundamental theoretical determinants

The issues of social/multiple stakeholder orientation in the institutions of higher education (HE) in the Republic of Croatia are defined as central issues of this empirical research project. It also strives to address the problems of efficient stakeholder management and the creation of social benefits in general. The project had been based on the theoretical model, which was verified on the sample of 87 public (state-owned) HE institutions, with the leaders of these institutions serving as respondents.

Majority of existing empirical studies measuring orientation of organizations in profit sector towards their customers have been conducted within different industries, taking mostly into account a single stakeholder - the customer/user, while only some of them[35] discussed orientation toward multiple stakeholders. Within the nonprofit sector, research had mostly concentrated to a certain nonprofit activity, by considering a single stakeholder, mostly the

---

Rivera, J.: «Measuring market orientation in several populations: A structural equations model», **European Journal of Marketing;** Vol. 32, No. 1/2, 1998.

end users/clients, or donors, or both of them[36]. As previously indicated, one of fundamental characteristics of the nonprofit sector is the existence of multiple constituencies and complexity of relations with clients.

Considering the characteristics of the Croatian HE sector and the academic community (discussed in the previous section of the paper), seven stakeholders *(students, potential students, economic sector, education personnel, authorized ministry/other state institutions, parents of actual and potential students, competition/other higher education institutions)* have been selected, in order to empirically verify whether the Croatian HE institutions express overall social responsibility by establishing and managing efficient stakeholder relationships.

The empirical research had been based upon a theoretical model, created to measure social responsibility of HE institutions by transparent and consistent treatment of all relevant target groups/stakeholders. The model was derived from the «classical» studies, including:

- research from the profit sector, conducted by Kohli and Jaworski[37], Narver and Slater[38], Deshpandé, Farley and Webster[39], including the adoption and modification of the measurement scales introduced by Kohli and Jaworski[40], as well as Kohli, Jaworski and Kumar[41];

- studies continuing the research on client/customer orientation, both in profit (Deng and Dart[42]) and nonprofit sector (Vasquez, Alvarez, and Santos[43], Caruana, Ramaseshan and Ewing[44], Balabanis, Stables and Philips[45], Kara, Spillan and DeShields[46]), with the special attention paid to the *model of multiple constituencies/stakeholders and different level of marketing/social orientation towards different subject groups*, originally developed by Padany and Gainer[47];

- approach to social orientation in terms of **behavior groups** (i.e. gathering market-related information, internal allocation of information and initiating response/reaction focused toward ensuring stakeholder satisfaction − as conceptualized by Kohli and Jaworski[48]), relying on the hypothesis that the higher level of orientation toward

[48] Kohli, A.K.; Jaworski, B.J., op. cit.

clients leads towards stronger client/customer-oriented organizational culture, which generates higher client/customer satisfaction (as proposed by Gainer and Padany[49]).

The resulting research hypotheses were as follows:

H_1: Higher education (HE) institutions in Croatia vary in levels of social orientation, which can be explained by the subject-specific orientation, i.e. the social orientation of HE institution varies according to relevant multiple stakeholders.
H_2: There is a significant difference in orientation toward relevant stakeholders among different types of HE institutions in Croatia.
H_3: There is a significant difference in orientation toward relevant stakeholders among different (scientific) fields of HE in Croatia.

4.2. Methodology

The empirical study has been based on a representative sample, with a specially designed questionnaire used to collect primary data. The questionnaire has been modified from the "classical" studies by Kohli, Jaworski and Kumar[50], as well as by Deng and Dart[51]. It included a large number of important control variables (e.g. type of higher education institution, number of professors employed, number and categorization of students[52], scientific field of a higher education institution[53], function of respondent, etc.). The research sample included managers (deans, vice-deans and/or high-level professional staff) of Croatian HE institutions. The collected data has been analyzed with adequate statistical methods, by using the PC-based software package *Statistica*.

The population for this project has been defined in terms of public (state-owned) higher education institutions in Republic of Croatia (103), with the sample selection framework based on the list and categorization of higher education institutions provided by the Ministry of science, education and sports[54]. The sample included 85 public school/faculties belonging to different universities (which has taken into account that the *Croatian universities are not integrated and currently represent only a loose association of individual schools/faculties)*, as well as two "new" universities - University of Dubrovnik and University of Zadar (Table 1), which were formally founded at the time the research has been carried out[55]. Namely, *the "new" universities* (developing from the individual schools/faculties) are *integrated,* with the organizational structure being based on *university departments*. Considering the fact that many departments of the "new" universities are in the early stages of development, their responses could not be considered as realistic for the purpose of the project. Therefore, only the largest, well-established departments of the "new" universities (that have existed as

University administration	2	2,30
TOTAL	87	100,00

Source: http://www.mzos.hr/ustanove/

Managers of public HE institutions (deans, vice-deans and high-level professional staff) were chosen as respondents, as they are believed to be the promoters of a certain type of organizational behavior and "architects" of organizational culture. In addition, those respondents have a close knowledge of organization and its functioning. The cover letter asked for the cooperation of either the dean himself/herself, or a high-level person informed about the subject of the research. As a result, vice-deans and high-level professionals attached to deans' offices also appeared as potential respondents. All three types of respondents are believed to have access to relevant information, while such a sample provides an additional level objectivity to the research.

Questionnaires were distributed to higher education institutions at the beginning of May 2006, in order to obtain response before the summer exam period. Two questionnaires were sent, one for the dean, and one for the secretary of higher education institution. The respondents were urged by telephone to provide a valid response, with the same channel used to solve possible problems. In the first month after the initial distribution, the response rate of 69% has been achieved.

4.3. Research results

Out of 87 higher education institutions included into the sample, 64 (74%) have taken part in the primary data collection. As 4 of the received questionnaires were not valid, 60 have been analyzed, which brings the final response rate to the level of 69%. In comparison with the similar empirical studies[56], with response rates ranging from 25% to 35%, the achieved success in the primary data collection can be assessed as completely satisfactory. Figure 4.

demonstrates the structure of institutions answering the questionnaire, grouped by the type of institution. The departments of the "new" universities *departments* (University of Dubrovnik and University of Zadar) have been classified under the category of individual faculties. Compared to Table 1, the sample is representative of the population.
Figure 4. Structure of higher education institutions by their type

Source: Research documentation

The scientific field of the sampled institutions is illustrated by Figure 5. In the research sample, the majority of HE institutions belong to the technical science (31.67%), followed by the social science (26.67%), and humanities (15%). They are followed by institutions active in several scientific fields (8.33%), biotechnology (8.33%), natural sciences (5.00%) and medicine (5.00%). Once again, the sample is representative of the population.
Figure 5. Structure of higher education institutions by science fields

Source: Research documentation

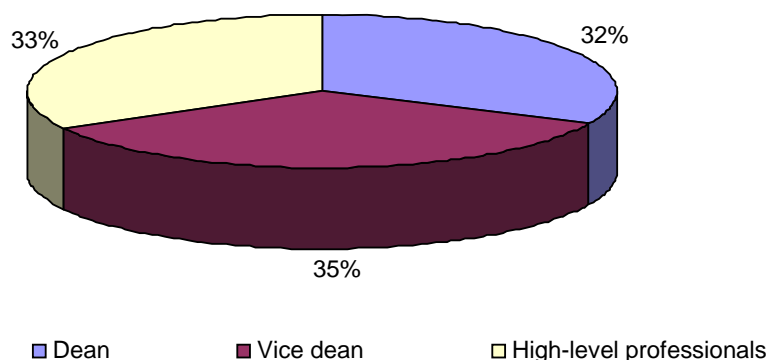
It has already been mentioned that the primary data were provided by deans, vice deans and high level professionals employed by HE institutions. Figure 6. illustrates structure of respondents according to the previously mentioned groups, which are represented by the almost identical amounts.


Figure 6. Structure of respondents according to their function

Source: Research documentation

The analysis of variance (ANOVA), examining the significant differences in average orientation toward all the stakeholders (see Table 2), can provide the answer to the issue whether the heterogeneous respondent sample affects the research results. With the empirical significance level of 0.6720, exceeding the theoretical level of 0.05, the zero hypothesis can be accepted, leading to the conclusion that *the answers of three respondent groups are not significantly different, i.e. the validity of the research results is not compromised.*

Figure 7. illustrates the structure of stakeholder orientation according to scientific fields covered by the Croatian HE institutions. All institutions, without regard to their scientific field, provide the strongest orientation toward their faculty, instead toward the students, who should be regarded as a fundamental stakeholder of such organizations. The surveyed organizations are also significantly committed to managing their relationship(s) towards (potential) competition. The HE institutions in different scientific fields have a varying relationship with the economy (as potential employers of their students), although the commitment of institutions in humanities, medicine and natural sciences to relationship(s) with the profit sector seems almost completely unexisting.

At the other hand, the HE institutions covering technical sciences or several scientific fields, followed by those in biotechnology and social sciences, pay a little more attention to the profit sector/economy, although such a result can not be described as satisfactory. Orientation toward the students' needs and managing relationships with potential students is also unsatisfactory, especially in technical sciences and humanities. None of surveyed institutions provides adequate attention toward their students' parents, who are supposed to be the primary sources of finance, if the students are supposed to pay for their higher education.
Figure 7. Stakeholder orientation of surveyed HE institutions by their scientific field

Source: Research documentation

Analysis of variance (Table 3.), analyzing the stakeholder orientation among institutions covering different scientific fields, at the significance level of 10%, demonstrates the significant differences in orientation for following stakeholders: students, economy and the Ministry of science, education and sports.

Therefore, it can be concluded that the surveyed HE institutions don't adequately recognize the most important stakeholder (students), regardless of their scientific area, with the differences in orientation towards multiple constituencies varying significantly. There could be several reasons which can explain such a finding: some institutions partly recognize students as their fundamental target group; others depend more heavily on student contributions and, therefore, recognize this relationship in a higher level; the third group of institutions has (a too) large number of students enrolled, with the demand constantly exceeding the supply, which leads to the situation in which students are not recognized as the fundamental stakeholder.

Same conclusion could be applied to the orientation of HE institutions toward the profit sector (perceived as the employer of the graduated students) and the Ministry of science, education and sports. Such findings can be explained by the major sources of funding – while institutions in some scientific fields rely exclusively to the funding from the state budget (provided by the relevant ministry), the other recognize the relationship(s) with the profit sector (economy) as the most significant source of funding.

Table 3. Analysis of variance of multiple stakeholder orientation among HE institutions in different scientific fields

Figure 8. illustrates the orientation toward the multiple stakeholders in relation to the type of the HE institution surveyed (see Figure 4 for structural determinants of the sample). Once again, regardless of the type of HE institution surveyed, the most important stakeholder seem to be the own faculty members, instead of students as a fundamental stakeholder. In addition, in almost all kinds of HE institutions, more attention is paid to competition/other HE institutions than toward the students.
Figure 8. Structure of multiple stakeholder orientation according to type of surveyed HE institutions

Source: Research documentation

Analysis of variance (Table 4.) analyzing the stakeholder orientation among different types of HE institutions, at the significance level of 10%, demonstrates the existence of significant differences in orientation toward the following stakeholders: students, economic sector and the Ministry of science, education and sports. This may lead to the same conclusion as in the previous case: all kinds of Croatian HE institutions do not recognize adequately the students as their most important stakeholder (students), while the differences in orientation toward other stakeholders vary significantly (especially if considering the differences in orientation toward students, economy and the relevant ministry).

6. CONCLUSIONS

Goals of education in general, especially of higher education - which establishes complex relations with multiple stakeholders/target groups - can be improved by adequately perceiving the importance of **social orientation and orientation towards multiple relevant stakeholders.** Such an orientation can greatly contribute to efficient stakeholder management and – ultimately – to the improved performance and increased satisfaction of multiple stakeholders, which can be described in terms of social benefits. This research project tried to empirically measure to what extent are the Croatian HE institutions socially responsible, by establishing how they treat their stakeholders.

The existing literature insufficiently covers the stakeholder management in the nonprofit sector, which applies especially to the higher education. In addition, there haven't been similar studies, applying the multiple constituency approach to the Croatian nonprofit sector, especially in the HE field, which is of special importance if challenges of the Bologna process are accounted for. The significance of this line of empirical research are further emphasized by the potential of the multiple constituency approach to contribute to success of realization

of mission and performance improvement in HE institutions, as confirmed by previous researches, both in profit and nonprofit sectors.

Results of the empirical study lead to the conclusion that the surveyed HE institutions *vary in levels of social orientation towards the relevant target groups/stakeholders, i.e. they show the subject-specific orientation.* Such a finding makes it easy to **accept the hypothesis H_1.** Considering the results of stakeholder orientation by scientific fields and types of HE institutions, it can be concluded that HE institutions significantly vary in their orientation toward different stakeholders, especially towards students, economy (as "final users" of the graduated students as the "final product" of the HE process) and the relevant ministry/other state institutions. This makes it possible to **accept the hypotheses H_2 and H_3.**

Results of the individual segments of the study demonstrate that the Croatian HE institutions **have not developed a transparent and consistent approach to stakeholder management,** especially toward their existing and potential students, as well as the profit sector (the economy), which puts their social responsibility in question. There could be numerous reasons for such a situation: a general lack of interest for the multiple constituency approach, both within the entire nonprofit sector and within the HE institutions; constant changes and low stability within the HE sector, the attempts to implement the binary HE system and the contingent change of the system into a mixed one; too high enrollment quotas in individual HE institutions, neglection of students as fundamental stakeholders, etc.

Some solutions could be found in the establishment of a binary HE system, which should result on two levels of independent institutions. It should also preserve the conceptual differences between professional and university studies, without "overloading" existing faculty at the level of university studies. Such a HE system could, however, retain its efficiency by the closer cooperation between the institutions at professional and university levels: for instance, through shared departments, professors and associates. Nevertheless, the empirical results firmly demonstrate that the Croatian HE institutions should firstly **recognize of students as their first and foremost partners**, while simultaneously paying adequate attention to other relevant stakeholders (profit sector, potential students, faculty, Ministry of science, education and sports, competition/other higher education institutions, parents). The transparent and consistent approach to multiple relevant target groups/stakeholders should, ultimately, lead toward increased social benefits in general.

Key words: *portfolio theory, multivariate forecasting, volatility, time-varying risk, asymmetric GARCH process*

1. INTRODUCTION

For any investor on stock market it is very important to predict possible loss, and different reaction of financial return series on "good" and "bad" information in economy. By forecasting portfolio risk investor can be ensured "a priori" from estimated market risk, using financial derivatives, i.e. options, forwards, futures and other instruments. In that sense we find financial econometrics as the most useful tool for modeling conditional mean and conditional variance of nonstationary financial time series. Using assumption of heavy tailed distribution, such as Student's t-distribution in multivariate GARCH(p,q) models, it becomes possible to forecast portfolio risk much more precisely. Such modeling enables time-varying portfolio risk forecasting, because the assumption of constant risk measures between stocks is unrealistic. The complete procedure of analysis is established using daily observations of Pliva stocks as the most frequently traded stock from CROBEX index at Zagreb Stock Exchange.

Pliva is one of the leaders in pharmacy industry in Eastern and Central Europe in more than 30 countries. After entering on quotation on London Stock Exchange in 1996 Plivas Activity has been expanded an all international markets. Therefore, toady more than 50% of Plivas total revenue is realized on western markets. In 2005 Pliva stocks were the most liquid on Zagreb Stock Exchange, with more than 600 billion kunas of turnover.

The interest of this paper is modeling volatility of returns of Pliva stocks on Zagreb Stock Exchange, measuring volatility reaction on market movements and the persistence of

volatility, assuming asymmetric information influence. The volatility response to a large negative return is often greater than it is to a large positive return of the same magnitude, i.e. "bad" information seems to have a greater effect on volatility, than does "good" information. This asymmetry in different information influence is called leverage effect. Glosten, Jaganathan, and Runkle (1993) showed how to capture asymmetric volatility using asymmetric GARCH model.

2. UNIT-ROOT NONSTATIONARITY OF PLIVA RETURNS

Pliva returns are defined as natural logarithmic change in the closing price of stock for each trading day as:

$$r_t = ln\,P_t - ln\,P_{t-1} = \Delta ln\,P_t = ln\frac{P_t}{P_{t-1}}, \qquad (1)$$

where r_t is daily return rate.

Closing prices and returns of Pliva stocks are plotted during observed time period from 1 January 2003 to 30 December 2005, including 742 trading days. From Figure 1 it is obvious that Pliva return series is unit-root nonstationary. It means it follows random walk model without constant term such as:

$$ln\,P_t = \phi_1 \cdot ln\,P_{t-1} + \varepsilon_t. \qquad (2)$$

Unit-root nonstationary means that parameter ϕ_1 is equal to unity.

Finally, according to (1) and (2) the model can be rewritten as follows:

$$\Delta ln\,P_t = r_t = \varepsilon_t. \qquad (3)$$
Source: www.zse.hr

Figure 1.   Closing Prices of Pliva on Zagreb Stock Exchange.

From expression (3) we can conclude that return series of Pliva stocks is random variable which is independent and identically distributed with zero-mean (Figure 2.).
Figure 2.   *Pliva Returns on ZSE.*

Unit-root nonstationarity can be tested using Dicky-Fuller statistic, testing the significance of parameter β_1 in DF regression:

$$r_t = \Delta ln\, P_t = (\phi_1 - 1) \cdot ln\, P_{t-1} + \varepsilon_t , \qquad (4)$$

$$r_t = \beta_1 \cdot ln\, P_{t-1} + \varepsilon_t . \qquad (5)$$

In equation (5) parameter β_1 equals $(\phi_1 - 1)$. Dicky-Fuller regression is just an OLS regression of returns on the lagged of Pliva stocks. The hypotheses are:

$$H_0 ... \beta_1 = 0$$
$$H_1 ... \beta_1 \neq 0.$$

If null hypothesis is valid, it means that ϕ_1 is equal to unity. In other words series of Pliva stocks is unit-root nonstationary.

Table 1. Dicky-Fuller Testing of Pliva Returns.

Null Hypothesis: LNPRICE has a unit root

		t-Statistic	Prob.*
Augmented Dickey-Fuller test statistic		-0.488176	0.5045
Test critical values:	1% level	-2.568086	
	5% level	-1.941251	
	10% level	-1.616412	

Augmented Dickey-Fuller Test Equation
Dependent Variable: D(LNPRICE)
Sample (adjusted): 1/03/2003 12/30/2005
Included observations: 741 after adjustments

Variable	Coefficient	Std. Error	t-Statistic	Prob.
LNPRICE(-1)	-5.29E-05	0.000108	-0.488176	0.6256

Sum squared resid	0.237021	Schwarz criterion	-5.200812
Log likelihood	1930.205	Durbin-Watson stat	2.019330

Source: Tested according to data on www.zse.hr.

As it is obvious from the Table 1., at the empirical p-value 0.5045, hypothesis H_0 can be accepted, so the assumption of random walk efficiency is confirmed.

3. TESTING FOR ASYMETRY IN DIFFERENT INFORMATION INFLUENCE

Before we continue to create the model to capture volatility of Pliva returns, it is necessary to investigate if there is asymmetry in volatility clustering i.e. if there is leverage effect. The tendency for volatility to decline when returns rise and to rise when returns fall is called the leverage effect, i.e. "bad" news seems to have a more effect on volatility than does "good" news. A simple test to investigate the leverage effect is to calculate first-order autocorrelation coefficient between lagged returns and current squared returns:

$$\frac{\sum_{i=2}^{n} r_t^2 r_{t-1}}{\sqrt{\sum_{i=2}^{n} r_t^4 \sum_{i=1}^{n} r_{t-1}^2}} \tag{6}$$

If above autocorrelation coefficient is negative and significantly different from zero, then there is asymmetry in volatility clustering. The results of this testing are given in Table 2.

Table 2. Results of Testing for Leverage Effects.

		Lagged returns
Squared returns	Correlation	-.096**
	Sig. (2-tailed)	.009
	N	741

** Correlation is significant at 0.01 level.

Source: Tested according to data on ZSE.

It can be concluded that there is asymmetric volatility clustering of Pliva returns at p-value less than 1%.

In Figure 3. it has been also examined ACF and PACF of square returns to detect volatility in Pliva return series. Box-Ljung statistics is used for testing the significance of first k autocorrelation coefficients. Q statistic for testing the significance of first k autocorrelation coefficients is given by:

$$Q(k) = n \cdot (n+2) \sum_{i=1}^{k} \frac{\hat{\rho}_i}{n-i} \qquad (7)$$
Expression in (7) has asymptotic chi-square distribution with k degrees of freedom.

Hypotheses for Q statistic are defined as:

$$H_0 : ... \rho_1 = \rho_2 = ... = \rho_k = 0$$
$$H_1 : ... \exists \rho_i \neq 0 \quad for \ i = 1,2,...,k$$

Testing results are given in the table on figure 3.

Figure 3.   Box-Ljung Testing.

At p-value even less than 1% alternative hypothesis can bee accepted, i.e. there is significant autocorrelation in squared return series of Pliva stocks for each time lag. It means that return series contain autoregressive conditional heteroscedastic (ARCH) effects.

4. ESTABLISHING ASIMMETRIC GARCH MODEL

ARCH(p) process of order p has been used to create nonlinear models for financial time series. To obtain more flexibility, a further extension, the generalized ARCH process was proposed by Bollerslev. Engle shows that it is possible to simultaneously model the conditional mean (expectation) and the conditional variance of financial time series.

Expectation of series return is calculated from the simple linear regression model, usually taking constant as regressor. If there is significant autocorrelation in returns, best fitted ARMA models are usually used, following Box-Jenkins procedure. In this research it has been found most appropriate to enter market return series of Crobex index as regressor.

In ARCH(p) models it is assumed that conditional variance is generated by autoregressive process, which means that forecast conditional variance as an AR(p) process is using squared of the estimated residuals. For example, ARCH(1) model in the simplest form can be written as:

$$r_{Pt} = r_{Mt} + \varepsilon_t$$
$$Var(\varepsilon_t) = \sigma_t^2 = \alpha_0 + \alpha_1 \cdot \varepsilon_{t-1}^2 + v_t. \tag{8}$$

First equation in above model is conditional mean equation, in which expectation of Pliva stock returns (r_{Pt}) is regressed to Crobex market return series (r_{Mt}) and ε_t are residuals or unexpected returns from linear regression. The second equation is conditional variance equation where v_t are white noise. It can be seen that ARCH(p) process captures the conditional heteroscedasticity of financial returns by assuming that today conditional variance is a linear function of past squared unexpected returns.

It has been shown that ARCH(p) process with infinite number of parameters is equivalent to much generalized ARCH process called GARCH. As the time lag increases in an ARCH(p) model it becomes more difficult to estimate parameters. Besides it is recommended to use parsimonious model as GARCH, that is much easier to identify and estimate.

GARCH(p,q) model adds q autoregressive terms to the ARCH(p) specification, and the conditional variance equation takes the next form:

$$\sigma_t^2 = \alpha_0 + \sum_{i=1}^{q} \alpha_i \cdot \varepsilon_{t-1}^2 + \sum_{j=1}^{p} \beta_j \cdot \sigma_{t-j}^2. \tag{9}$$

However, it is rarely necessary to use more than a GARCH(1,1) model, as in this case should be confirmed. Model has just one lagged error square and one autoregressive term:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \cdot \varepsilon_{t-1}^2 + \beta_1 \cdot \sigma_{t-1}^2. \qquad (10)$$

But if there is asymmetric volatility clustering Glosten, Jaganathan and Runkle (1993) proposed asymmetric GARCH(1,1) model (GJR-GARCH(1,1) model) such as:

$$\sigma_t^2 = \alpha_0 + \alpha_1 \cdot \varepsilon_{t-1}^2 + \alpha_2 \cdot d_{t-1} \cdot \varepsilon_{t-1}^2 + \beta_1 \cdot \sigma_{t-1}^2 \qquad (11)$$

where d_{t-1} is dummy variable which takes two different values depending on "bad" or "good" news. However, if the news is "good" a residual from expected return will be positive, i.e. $\varepsilon_t > 0$, and if the news is "bad" a residual from expected return will be negative, i.e. $\varepsilon_t < 0$. So, to capture different effect of "bad" and "good" news to conditional variance, we enter dummy variable in expression (11) such:

$$d_{t-1} = \begin{cases} 1 & if \quad e_{t-1} < 0 \\ 0 & if \quad e_{t-1} \geq 0 \end{cases} \qquad (12)$$

By rewriting model in expression (11) as:

$$\sigma_t^2 = \alpha_0 + (\alpha_1 + \alpha_2 \cdot d_{t-1}) \cdot \varepsilon_{t-1}^2 + \beta_1 \cdot \sigma_{t-1}^2, \qquad (13)$$

it can be seen that "good" news from the previous day, when $d_{t-1} = 0$, influences conditional variance by parameter α_1 and a "bad" news from the previous day, when $d_{t-1} = 1$, effects conditional variance by sum of parameters $\alpha_1 + \alpha_2$. Therefore, if we find that parameter $\alpha_2 > 0$ and statistically different from zero, negative shocks will have larger effects on volatility than positive shocks, assuming that condition of nonnegativity and stationarity of the process is met.

5. VOLATILITY MODELING BY GJR MODEL

5.1. Mean Equation of Pliva Returns

Before modeling asymmetric volatility using GJR-GARCH(1,1) market return of Crobex index as regressor is entered in mean equation of Pliva returns, without constant term. The model is estimated and shown in table 4.

Table 4. Mean Equation of Pliva Returns.

Dependent Variable: r_t

Included observations: 742

Variable	Coefficient	Std. Error	t-Statistic	Prob.
market return	0.857806	0.051128	16.77776	0.0000

S.E. of regression	0.015239	Akaike info criterion	-5.528624
Sum squared resid	0.172304	Schwarz criterion	-5.522418
Log likelihood	2054.884	Durbin-Watson stat	2.030707

Source: Estimated according to data on www.zse.hr.

When modeling return series it is more convenient to measure goodness of fit using Akaike information criteria (AIC) and Schwarz criteria (SC), than the standard measures. Analytical expression of the mean equation is given by:

$$r_t = 0.8578 \cdot r_{Mt} + \varepsilon_t .$$ (14)

Consequently, according to the model (14) the expected returns of Pliva stocks are not constant over time. Beside, from the residuals, it can bee seen that variance is also time-varying, i.e. heteroscedastic. This confirms again that time-varying variance depends exclusively on the residuals. Therefore, further analysis is directed to the movement of residuals in order to choose the adequate form of GJR-GARCH model allowing precise prediction.

5.2. Residual Testing

More formal Lagrange multiplier (LM) test of ARCH process in volatility disturbances or unexpected returns given in (14) is performed. ARCH–LM tests whereas variance is homoscedastic or heteroscedastic using test equation on lagged square residuals as:

$$\hat{\varepsilon}_t^2 = \hat{\beta} + \sum_{j=1}^{m} \hat{\beta}_j \cdot \varepsilon_{t-j}^2 ,$$ (15)

where *m* is time lag, usually greater then 2.

From Table 5. it can be seen that variance is heteroscedastic because the square unexpected returns follows AR(1) process, i.e. parameter $\hat{\beta}_1$ is statistically significant at p-value of 0.04%, or even more, LM test value is significant at 0.067%, which means that variance is not constant.

Table 5. Testing of Heteroscedastic Variance of Pliva Returns

ARCH Test:

F-statistic	4.104947	Probability	0.006662
Obs*R-squared	12.17801	Probability	0.006798

Test Equation:
Dependent Variable: RESID^2
Included observations: 740 after adjustments

5.3 Model Estimation.

From the Q-Q plot of return series of Pliva stocks, as from the histogram it can be seen that return series is negative skewed with kurtosis higher than 3, which is most empirical finding in financial time series. It means that for most financial assets, the distribution function of returns is fat-tailed. From figures 4. and 5. it can be seen that fat-tail distribution has more weight in the tails than a normal distribution. Therefore, it was decided to estimate GJR-GARCH(1,1) model assuming that function of Pliva returns follows Student distribution, because in such cases Student distribution places a greater likelihood on large realizations than does the normal distribution.

```

Source: Estimated according to data on www.zse.hr.

In unrestricted estimated model parameter α_1 is no more significant at the level of 99%, which means it can be removed from the model because there is no evidence to accept that "good" information reduces the conditional volatility. It is usually necessary to ensure convergence of the process such that:

$$\hat{\alpha} > 0,$$
$$\alpha_1 + \alpha_2 \geq 0,$$
$$\hat{\alpha}_1 + \hat{\beta}_1 < 1,$$
$$0 < \hat{\beta}_1 < 1.$$

(16)

In this case $\hat{\alpha}_1 + \hat{\beta}_1$ is equal to 0.89 which defines stationary condition i.e. convergence of the process, even not far from long-memory model, when $\hat{\alpha}_1 + \hat{\beta}_1 = 1$.

Parameter $\hat{\beta}_1$ measures volatility persistence. The largest value of the coefficient $\hat{\beta}_1$ indicates that shocks to conditional variance take a long time to die out, so volatility is persistent. In this case parameter $\hat{\beta}_1$ indicates that there is persistence volatility, i.e. variance decays very slowly, because the degree of persistence is more than 88 percent.

Even so the positive influence of "bad" news on variance is confirmed, i.e. "estimated sum" of parameters $\alpha_1 + \alpha_2$ equals to 0.133168.

In the last step GJR-GARCH(1,0) model, without parameter α_1, has been estimated. The results are shown in table 7.

Table 7. Estimation of GJR - GARCH(1,0) Model Assuming Student Distribution.

```

Source: Estimated according data on www.zse.hr.

This sensitivity analysis confirmed that alpha 1 has not statistically significant influence on time-varying variance and all other parameters are almost identical.

On figure 6. there is forecast of Pliva returns conditional variance in and out of sample.

Diagnostic checking for estimated model includes investigating standardized residuals for model adequacy, which are defined as:

$$s_t = \frac{\hat{\varepsilon}_t}{\sqrt{\hat{\sigma}_t}} \ . \tag{17}$$

Source: According to data on ZSE
Figure 6.   *Forecast of Pliva Returns Conditional Variance In and Out of Sample*

Standardized residuals have shown that there is no more serially correlation in squares, without any GARCH effect left.

6. CONCLUSION

It is common that highly developed and liquid capital markets react intensively on a new information. This paper reveals that the Croatian capital market reacts to a smaller extent, which is shown on example of Pliva stocks as the most frequently traded stock from CROBEX index at Zagreb Stock Exchange.

Financial theory assumes that many economic time series do not have a constant mean and/or constant variance such as financial time series. These financial time series contain volatility which is time-varying. Even so, in practice volatility is often asymmetric, which means that financial return series react differently on "good" and "bad" information. Today, even although it is difficult to predict price variations of financial asset, different models are used to forecast daily volatility. To any asset holder it is important to forecast the rate of return and its variance over the holding period and to estimate the risk associated with holding a particular asset.

As the most appropriate models for those analysis ARCH (Autoregressive Conditional Heteroscedasticity) and generalization of the ARCH models (Generalized Autoregressive Conditional Heteroscedasticity - GARCH) are implied.

Distribution of Pliva returns is fat-tailed, therefore it's most appropriate to assume Student distribution. Total model parameters are estimated using iterative maximum likelihood method in GJR - GARCH(1,0) process.

Estimated model parameters (without alpha 1) are not only statistically significant, but also they have almost identical values as in model GJR - GARCH(1,1). According that, characteristic of Croatian capital market is absence of intensive reaction on "good"

information. Those behaviors have been noticed also in empirical studies on development capital markets, as for example in the NYSE Composite index 2002.

Finally it can be concluded that Pliva stocks volatility on Croatian capital market are under dominant influence of "bad" information, which was the basic aim to be shown by this paper.

Key words: *Corporate Governance, Stakeholders, Shareholders,*

1. SHAREHOLDERS, SHAREHOLDER VALUE, AND STAKEHOLDERS

1.1. Two alternative concepts of the corporation and of its governance

1. The corporation belongs to stockholders and in their interest must be run. This conception finds its clearest expression in the shareholder value doctrine, according to which the corporation must be run in the interest of shareholders, creating value on their behalf. Thus the objective of management should be to maximize the market value of the company. This is in accordance, in particular, with the interest of minority shareholders, which should be adequately protected.

2. The corporation must be run in the interest of stakeholders. As the interest of stakeholders is various and contradictory, a compromise between the pursuit of the various interests should be found. This compromise could be trusted to managers (Berle and Means' view), to politicians, to an articulated management board, where the different instances may be represented, leading through their interaction and compromise to the specification of the overall interest of the company. According to the latter viewpoint the corporation can be seen as a community, and as such must be run. In the stakeholders' view may also be included the vision of the social responsibility of the firm, whereby society as a whole is a stockholder.

---

[1] The paper is the outcome of a common interest in the issue of corporate governance and a common research project. The authorship of the first part is mainly to be ascribed to Alberto Chilosi, the authorship of the second part mainly to Mirella Damiani.

The different conceptions have their counterpart in different aspects of corporate law, from the composition and election rules of directors, to the publicity of societal documents, up to the determination of the rules that determine the framework of corporate life, concerning fusions and mergers, takeovers, and the legal framework of capital markets.[2] Of the two conceptions the first seems to be dominant, especially in the Anglo-Saxon environment. In a somewhat different perspective the various corporate institutional systems prevailing in different countries may be seen, whoever are the principals, as different methods to deal with the problem of the separation of ownership and control. The second part of the present paper is dedicated in particular to the consideration of the latter issue in the specific framework of the stakeholder view.

1.2 Corporate governance and shareholder interest

A possible manifestation of the doctrine of shareholder value lies in the gigantic increase in payments to managers under the form of options, or at any rate tied to the value of shares, particularly in the USA and in the nineties.[3] A possible explanation lies in the diffusion of the doctrine of shareholder value and in the increased awareness of the agency problem: with option payments shareholders' and managers' interests should be made to coincide, which would be especially valuable whenever share capital is dispersed. But there is also an alternative explanation: whenever ownership is dispersed, options make a good opportunity for managers to mask somewhat the taking advantage of their controlling power. According to a view, in Europe those in control of the corporation, be they top managers or blockholders, can benefit of a rent of control that is no lesser than in the USA, but, owing to lower protection of minority shareholders may take more obtrusive and fraudulent forms of self dealing (such as, for instance, asset stripping and transfer prices). This is borne out by the conspicuous additional payments for transferring ownership of packets of shares with control rights.[4] In turn, in the USA until recently option payments were not considered as cost items and therefore they did not reduce accounting profitability. (In recent times however some attempts have been made to take into account their fair value, through a mark-to-model methodology.[5]) Their value is not immediately detectable by the public, and in particular by shareholders, especially since in general options are issued "on the money".[6] At the same time they have a relatively more limited value for managers, considering risk differentiation, and thus they may be equivalent to fixed compensations of lesser value. On the other hand option values do not need to have immediate consequences on managerial incentives in so far as they depend on overall firm performance; managers can cash in options to their advantage even if their firm does not perform any better than the average, whenever the stock exchange grows.

---

[2] For some discussion of the alternative disciplines see Aglietta, Rebérioux (2005, p. 52 f.), and the literature quoted there.

[3] See Krugman (2002); Damiani (2006), pp. 125, 209-212.

[4] Cf. Dick and Zingales (2004).

[5] According to a 1973 ruling of the Accounting Principle Board (APB, opinion 25) stock options must be included into the accounting books only for the difference between market price of shares and strike price. Subsequently, in 1993, the APB successor, the Financial Accounting Standards Board (FASB), advised registering all options at the fair market value, according to Black and Scholes formula. In 1995 this became compulsory (according to the FASB Statement 123). However, owing to obvious difficulties of that evaluation FASB has in practice allowed companies to carry on according to APB provision. Presently new rules have been introduced by FASB in June 2005. According to them the fair value of options must be recorded at the time of their concession. The whole issue is still debated and in the process of revision, as documented in Bulow and Shoven (2005).

[6] This means the purchase price of the shares is determined at the level the shares are valued by the stock exchange at the time when the option rights are conferred.

If it declines, options are often changed to new strike values (or the on the money date is fraudulently changed, as in the purported recent case of Apple).

On the whole it seems likely that huge managerial remunerations have more a distributional than an incentive effect. From an elementary economic theory viewpoint one may consider that the wealth effect of increasing managerial compensation could dominate the substitution effect, leading to lower managerial exertion. In short: **lean cats may run faster than fat cats.** Competition in recruiting the best managers could lead to a race towards increased average compensation, but this could result in a negative external effect, producing, because of the dominance of the wealth effect, reduced overall managerial exertion. This negative effect on X-efficiency could dominate the positive effect of allocating the best managers where the positive effect of their managerial capabilities is reputed the highest. Thus increasing the compensation of any top executive officer, for instance, could be associated with negative externalities, by putting pressure on the level of other top executive officers compensation, to the disadvantage of society as a whole, both because of distributional as well as X-efficiency considerations. To curb managerial compensation through direct ceilings could be unwise, since there is some argument in favour of having managerial abilities allocated through the market. But there is probably ample scope to pursue the objective by changing the regulations that affect the way through which managerial remunerations are determined. More power could be given to shareholders' (and especially minority shareholders') representatives (and possibly to shareholders themselves through some kind of electronic consultation). More transparency and information as to the actual elements of overall managerial compensation could be required, and possible tax loopholes on participatory incomes could be abolished.[7]

1.3 The alternative view, of the firm as a community of stakeholders, and the Nirvana fallacy

Even aside from the above distributional issues, there have been in the functioning of corporations and of financial markets many cases of foul play and instability, stock market roller coasters, and bubbles deflating suddenly to the dismay of mass of savers. Does this mean that the Anglo-American system, in particular, as founded on the extension of financial markets, and on shareholder value, must be refuted? After all, why should corporations be managed in the exclusive interest of shareholders, who are simply security owners? Thus, why not focus instead on the interest of the stakeholders, such as employees, local communities, political actors, or on the interest of the society as a whole, following Berle and Means plea (1934, pp. 352-57), or rather on the interest of the company as a going concern, as proposed by some?[8] But what is the interest of the company? How do we define it? After all the company is an immaterial entity, of organizational kind, not blood and flesh, even if it contains blood and flesh. As such, unlike individual stakeholders, the firm has no interests and preferences. And who is entitled to interpret and represent the various stakeholders' interests? The negative aspects of market and shareholder value oriented corporate governance are quite open and well known. But this does not mean that an alternative system of corporate management founded on stakeholders' interest could lead to better results, without considering in depth its possible overall consequences. As argued by Berle and Means, managers should become "a purely neutral technocracy, balancing a variety of claims by various groups in the community and assigning to each a portion of the income stream on the basis of public policy rather than private cupidity"(Berle and Means, 1934, p. 356), where

---

[7] On the basis of an argument such as the above one could also envisage to increase the tax burden on high labour incomes whenever it is low (but this, as in the case of curbs on managerial compensation, could lead to some human capital flights, or to a reduction of net human capital imports).

[8] See Aglietta and Rebérioux (2005).

"public policy" could be the outcome of a program set forth by "corporate leaders", "for example … comprising fair wages, security to employees, reasonable service to their public, and stabilization of business" (p. 356). The obvious alternative is that such a "program" should be set through the political process.

But then the power of whoever is in charge becomes all the more arbitrary as the results of corporate activity cannot be assessed, unlike in the case of shareholder value, according to some kind of almost objective benchmark. In the name of stakeholders' interest one may justify nearly every course of action, such as *in primis* the maintenance of unviable enterprises that instead of creating value are value detracting, as the resources they use would be better employed elsewhere. But also financing politics and politicians; the appropriation by employees or of local communities of potential profits through higher wages, higher employment, or organizational relaxation; appropriation of company's resources by managers trough foul play (such as self-dealing and transfer pricing); or may be a bit of everything at the same time, in order not to do injustice to the different categories of "stockholders"; last but not least, simply, bad management. The consequences of stakeholder management can lead to tragic waste, whenever budget constraints are soft, and can be loosened by politicians for pursuing patronage, petty favouritism, or other localized political objectives. Of this in Italy we had many instances, including in particular the ultimate fate of mixed public-private ownership enterprises, where private shareholders had no decisional power, which rested on managers appointed by the government. On the other hand lawmakers' specific vision of the stakeholder view can be incorporated in the norms which regulate the organization and the functioning of companies, and the representation, and representatives' power, of the different categories of stakeholders in the organs of corporate governance (including such ad hoc measures as government's golden share in some perceived publicly relevant companies). From the exertion of the different powers, taking into consideration the overall legal and social framework, the way in which the interest of the different stakeholders are compromised will result.

1.4 Stakeholders' power and markets

But first of all we want to deal with a basic issue: why should managers be chosen by controlling shareholders rather than by the employees, or the trade unions, or, say, local authorities? A first motive is that companies are established by partners signing the original contract leading to firm incorporation (we apologize for stating this very obvious fact, but many discussions on the issue of corporate governance appear to almost forget it). If partners (i.e. shareholders) were denied the power to appoint and direct managers they would lack the motivation to found and finance the company. It is true that in many cases existing shareholders are not the original partners, but the possibility to eventually transfer their property rights in the firm, selling the shares of the firm on the open market ("liquidity"), constitutes a powerful inducement to found the firm in the first place. Whenever shareholder interest (and especially the interest of minority shareholders) is better protected the extension of financial markets is greater, and the financing of firms, as well as the control of the way they are managed, occurs in a relatively more transparent manner through the market. Selling firms in parts or in their entirety is easier. Hostile takeovers, whenever they are effectively possible, may perform as a disciplining device, and possibly lead to a more efficient management of resources and higher growth.[9]

---

[9] On this, as on other specific points, one is referred for the more comprehensive treatment in the second part of the paper.

The opposite takes place whenever (as in the "continental" model) the protection of shareholder rights is lower, and financing through bank credit is more relevant, as financial markets are thinner. Of course bank credit has a number of possible advantages: better knowledge of the situation of firms and therefore better monitoring by bankers than by most shareholders, increasing returns from bank activity through pooling of information. But there are also perceived disadvantages, such as lesser propensity towards financing risky investments, among others because lower division of risk. (The cost of giving and managing a loan is certainly much larger than that of purchasing and keeping a variable amounts of shares. Any individual shareholder may have a modest amount of shares of any company, and shareholders are many. A company on the other hand usually deals instead with a very limited number of banks.) A consequence in continental Europe could be the lack of venture investors and business angels, available to finance risky investments with the aim of liquidate their investments by getting public. This is common practice in the USA, where it is made possible by the existence of a vast liquid financial market, which facilitates new underwritings. The limitations in equity financing may put a heavy toll on the creation of innovative firms. As Tirole (2001, p. 20) puts it, contrary to the polar case of established firms in mature sectors, "a high-tech start up usually generates little or no income for a long while and must therefore be financed mainly through equity; short- and medium-term debt would create serious liquidity problems." Moreover the option of going public favours the growth of successful enterprises. It can also be a smooth way to solve the problem of generational transition of family businesses, and of the need to more or less gradual transfer of corporate control, due to aging or reduced interest by the original entrepreneurs. In a shrinking world with high capital mobility, limitations to the extent and articulation of financial markets, and lower shareholder protection may result in a greater tendency to portfolio investment outflows abroad, especially towards countries where the contrary applies (example: the inflow of capitals into the American financial market that, among others, contributed to finance the speculative bubble of the late nineties; little power of attraction for foreign investments by Italy).
.

1.5 Shareholder value and the social function of profit

But the fundamental motive in favour of the principle that companies must be managed in shareholder interest is that shareholder interest directs firms' activity towards profit formation, instead of alternative objectives, such as those we have mentioned above related to the pursuit of stakeholders interests, or simply of carrying on production for its own sake. And the pursuit of profit is in the interest of society as a whole, provided of course that it occurs in the framework of a whole set of legal constraints that take into account the external effects of economic activities, as well as countering market failures and preventing opportunistic and fraudulent behaviour. Moreover, as any other human activity, one should expect that in the pursuit of profit some kind of basic moral principles should be observed, even if their exact definition could be highly controversial. The same applies to etiquette and some sense of social responsibility (taking into consideration the consequences of one's action on everybody else) which should apply to corporate as well as to personal behaviour, and which not necessarily is contrary to the profit motive, at least in a long-run, repeated game, perspective. Basically, profit is the difference between measured revenues and measured costs. Even if this provides a very imperfect measure of the social benefit of an economic activity, still it is better to have a very imperfect measure than none at all, and no obvious alternative is available. Moreover profit provides a motive as well as, independently of the acceptance or refusal of the shareholder value principle, a source of the growth of the firm in a market economy. Profitability conditions the extent of external finance, be it from bank credit or from financial markets (Damiani, 2006, p. 136). Furthermore, whatever the

governance system, reinvested profits make on the whole the principal financial source of firm expansion. Some do infer from this that size and liquidity of the financial markets should not matter very much and that shareholder rights can be limited in corporate governance without much affecting the growth of the firms, since the greatest bulk of transactions involve existing shares changing hands rather than financing firms through issuance of new shares. Here we can make an analogy with the estate market. In the real estate market the bulk of transactions involve selling and purchasing existing estate, rather than building new one. At any moment of time the set of houses is independent of property rights (alike to the sets of companies and of physical capital): you can instantaneously change the nature and distribution of property rights in real estate (you could instantaneously change the extent of shareholder property rights) and in the short run the available housing stock does not change (the set of existing companies and of physical capital does not change). But in the longer run the amount and the quality of available housing changes a great deal, since changing property rights in real estate changes the incentives towards construction, maintenance and efficient allocation (changing shareholder rights changes the incentives for firms being created, managed and grow).

1.6 Employees as stakeholders, workers' interest, and the fallacy of composition

Let us consider a very clear cut case: Alitalia vs. Ryanair. Where does the social interest lie? Which one has acted in the best interest of workers (if we consider also the large number of workers who take advantage of cheap flights by Ryanair)? Alitalia is an emblematic case of a loss making and shrinking company, acting in the pursuit of some stakeholders' (in particular employees' and politicians') interest, destructing instead of creating value. Ryanair is a competitive, highly profitable, fast growing company, dramatically increasing the supply of cheap transport services for everybody concerned. From the above mentioned case one may well understand that workers' interest in general does not necessarily coincide with the interest of the employees of a given firm to have higher wages than elsewhere, more relaxed working conditions, and de facto tenure in the job. But would workers' interest in general be favoured by having employees' representatives as significant participants in the governing boards of any given firm? At first sight one would see an affirmative answer as obvious. But this would not take into consideration that in **every single firm** employees' representatives will presumably try to act in the best interest of the employees of **that given firm.** To think that from the pursuit of employees' interest of **any given firm** the pursuit of workers' interest in general follows is an example of the fallacy of composition. One may also note that in the prescriptions of the labour code employees' interests are taken into consideration and protected. It is not at all obvious that an additional defence in the area of capital governance would be suitable and useful. The pursuit of insiders' interests could lead to a slowing down of the growth of firms, as a consequence, say, of higher wages and lower profitability, and to worse allocative efficiency. This could be to the disadvantage of the outsiders who otherwise could take advantage of the growth of the firm, as a consequence of higher employment and a greater and cheaper supply of goods and services (Alitalia vs, Ryanair case). The result could be higher unemployment and lower living standards for the unemployed, and for those employed in firms with lower productivity and lower wages. To the extent that any employment reduction would be resisted, this could lead to the blockage of the mechanism that through the market (including the market of corporate control) leads to the transfer of resources, labour in particular, from where they are less productive to where they are more.[10]

---

[10] Of course, owing to faulty market signals, the substance could be different from the appearance, But on this subject we may refer to what has been said above relatively to the function of profitability and the nature of market signals.

In the middle-long period at least, wage and employment dynamics may be negatively affected at the level of the economic system as a whole.

1.7 The issue of scalability and the weight of organized interests

Particular categories of insiders are top executive officers and control blockholders. Interventions to their advantage (as well as to the advantage of employees fearing that takeovers could result in redundancies) are those reducing the scalability of corporations (particularly, as is often in practice the case in Europe, if the takeover bid comes from abroad). In some countries the joining forces of organized insider interests, managers, blockholders, local authorities, employees, banks can lead to stagnation and bad utilization of productive resources.[11] The recent relative stagnation of German or Japanese economies could be partly explained in this Olsonian perspective, as a consequence of the concretion of pressure groups and organized interests.

A possible justification of restricting the possibility of hostile takeover bids is that if management is all the time exceedingly preoccupied with fending off the danger of hostile takeovers, and thus with current stock exchange values, this could lead to excessively shortening of time horizons, reducing interest and attention for long run programs.[12] This tendency is often considered a disadvantage of the Anglo-Saxon public company system in comparison to the continental or Japanese system of corporate control by insiders and banks. On the whole the empirical inquiries as to the effective results of takeovers are rather ambiguous and contradictory.

1.8 Possible positive consequences of employee representation in corporate governance bodies

Control by empowered employee representatives could contribute to hold in check the possible tendencies to opportunistic and self-dealing behaviour by top managers and control shareholders. Employee representation in governance bodies could also improve the quality of accounting documents, with positive consequences, among others, for fiscal transparency.[13] It could bring about a better climate of industrial relations, among others as a consequence of some greater identification of the interest of employees with the interest of the firm. There could be better trust that disclosing preferences and transmitting valuable information by employees would be used to their benefit too, and thus it would stimulate the transmission of valuable information inside the firm.[14] A consideration often heard concerns the protection, and thus stimulation, of employees' firm specific investments. Alternatively, the protection of firm specific investments by employees can be engineered on the one hand by the interest of the firm towards building a reputation, and on the other by labour law provisions, in particular those protecting employees against unfair dismissals. It is by no means obvious that firm

---

[11] A way in which the interest of stakeholders can assert itself is by pressing for legislative intervention limiting companies' contestability and scalability. This has taken place towards the end of the eighties in the United States, after the Reagan administration devolved at state level the competences in corporate legislation, resulting in new legislation curbing hostile takeovers. This is translated into the drastic reduction in the percentage of hostile acquisitions in the nineties in relation to the eighties (cf. Damiani, 2006, p. 182).

[12] The stock exchange capitalization may be depressed not only as a consequence of ineffective management, but also because of contingent and even irrational factors not economically justifying as such a change of management, but leading to a hostile takeover anyway (the high transaction costs and the length of time involved may however reduce this possibility).

[13] Cf. with reference to the specific German case Jackson et alii, 2004, p. 41.

[14] Cf. Freeman and Lazear, 1994, pp. 15-16.

specific investments by employees, who could because of this aspire to a higher remuneration, would find adequate protection through employee representation in governance bodies (or for that matter through trade union representatives): Owing to possible egalitarian bias, or to the relative numerosity of employees with relevant and of those with little human capital, be it general or specific, employee representatives could be biased in favour of the interest of those who did not make, or made lower than average, specific investments, and, on this account, could not look forward to receive an additional remuneration.

1.9 The case for mandatory employee representation

The case for mandatory employee representation in corporate governance bodies may depend on the balance of two possibly contradictory effects. On the one hand some degree of involvement of employee representatives in corporate governance could be beneficial for overall productivity and value added creation, on the other it could affect the distribution of entrepreneurial surplus to the disadvantage of employers. If the second effect dominates the first, it will be in the best interest of employers not to establish employee representation in the corporate governance of the firm, if only in the form of workers' councils, while it could be in the general interest to establish it if by so doing overall firm surplus could be increased.[15] To this argument three types of objections could be raised. First, it could be difficult in practice to determine what degree, if any, of employee representatives' power, would maximize, or simply affect positively, overall firm surplus. In particular a general legal provision would not be able to discriminate between the different firm specific circumstances. Second, the previous argument against the enhancement of insiders power, that could be exerted to the detriment of outsiders and the general public, would still apply. Third, the reduction of employers' power may reduce the incentives to become employers. Supply of managerial talent and capabilities could (but not necessarily would) suffer, and this could affect, among others, the overall demand for labour.

1.10 In the end: what happens in practice?

Some research has been dedicated to the issue of the overall economic consequences of alternative systems of corporate governance (see in particular Gugler, 2001; Maher and Andersson, 1999), but the outcomes have been mostly contradictory and ambiguous, such as not to allow strong and definitive conclusions.[16] This could lead one to think that, in the case of corporate governance too, the performance of institutions depends on the social environment and that there is a tendency for institutions to adapt to the environment. Or, may be, that analogous results can be obtained through different institutional set-ups. Thus, the issue remains open and requires further study.

2. THE PRINCIPAL-AGENT PROBLEM IN A STAKEHOLDER CONTEXT

2.1 Incentives and labour relationships in a stakeholder model

Reliable measures of stakeholders' welfare are difficult to find, and the problem of providing explicit incentives to pursue the interests of a multiplicity of stakeholders seems to fit well, as noticed in Tirole (2001), with the *multitasks* agency model suggested by Holmstrom and

---

[15] Freeman and Lazear (1994).
[16] A synthetic review of the empirical studies in this area, see Damiani, 2006, pp. 102, 104, 110, 123-126.

Milgrom (1991). In this model, a well-designed incentive system has to balance the distortions that may induce effort in one task but indifference and sub-optimal strain in some other occupations. These considerations gain relevance in a stakeholder perspective, since management may rationalize any action by invoking its impact on the welfare of some stakeholders, even if these actions worsen the welfare of some others. Since this balance is difficult, a *flat* compensation system may be preferable, and in this perspective, "there is some consistency between lenient views in the French, German, and Japanese populations toward the stakeholder society and the low power of the managerial incentive schemes in these countries" (Tirole, 2001, p. 26). The following table shows that in the U.S., i.e. in the more shareholder-oriented system, the CEO's compensation is less flat than in the other countries:

Table 1 Flat CEO's compensation and stakeholder society: variable remuneration as percentage of total remuneration in some countries

	Variable CEOs' remuneration component			
Countries	1996	2001	2003	2005
France	29%	26%	29%	41%
Germany	12%	36%	51%	52%
Italy	24%	33%	30%	35%
Japan	8%	18%	19%	22%
UK	30%	30%	34%	35%
US	47%	61%	63%	62%

Source: Towers Perrin, 2001-2002, 1997, 2005 "Worldwide Remuneration Data

In any case, even by adopting a flat remuneration system, some critical objections on the feasibility of the stakeholder view remain and the existing literature seems to present two opposite views. As Jensen (2001) writes:

" Whereas value maximization provides corporate managers with a *single* objective, stakeholder theory directs corporate managers to serve '*many masters.*' And, to paraphrase the old adage, when there are many masters, all end up being shortchanged. Without the clarity of mission provided by a *single-valued objective function*, companies embracing stakeholder theory will experience managerial confusion, conflict, inefficiency, and perhaps even competitive failure. And the same fate is likely to be visited on those companies that use the so called 'Balanced Scorecard' approach—the managerial equivalent of stakeholder theory—as a performance measurement system."

Following Jensen, it may be argued that corporate governance arrangements that give 'voice' to employees, as codetermination in Germany, increase agency costs because they dilute the board's power, promote collusion between management and employees and impede the emergence of a dispersed ownership.

On the other hand, the potential strength of a 'broad' view of the firm is advocated. In this alternative perspective "the multiple and hard-to-measure missions of management" (Tirole, 2006, p. 59) are obtained by the same institution of a supervisory board, where owners and employees exert their monitoring function on management. Here, again, the German experience becomes a benchmark model, but in this perspective this experience confirms the success of the 'stakeholder' system of corporate governance, as evaluated in Hall and Soskice (2001a). A success that may be attributed, in a more comprehensive analysis, not only by the *sole* device of a two-tier board, but also by the crucial role played by some *institutional complementarities*, as we will see below.

Let us briefly see how the two different radical views may be supported by simply making a short excursion of some selected studies that are representative of the pro and cons of a stakeholders' view.

The thesis advanced by Jensen (2001) has been proved with different tools, as the sociopolitical analysis proposed by Pistor (1999), the legal perspective advanced by Roe (1999), or the econometric evidence shown in Gorton and Schmidt (2004), just to name some of the few but prominent contributions playing in the arena.

In the sociopolitical perspective, Pistor (1999) suggests that under codetermination, labour representatives may be very active actors in *extraordinary* situations, such as those calling for takeover resistance, while exerting a less active role in *day-to day* governance. Employees' representatives do not "specialize" in business strategies, but only in workplace and employment matters, notwithstanding the training programs to support their professional competence, as those undertaken in Germany by the National Federation of Labour Unions. In this context where multi-player coalitions are present, the option 'voice' remains partly unexploited and a room for managerial failures is left open. "The net beneficiaries are those who ought to be controlled: the company's management" (Pistor, 1999, p. 192). Furthermore, the voice of labour may be not a single voice, as the mechanism of worker representation reveals conflicts of interests between white and blue collars, who in Germany elect in separate sessions their delegates for the designation of the supervisory board. Without speaking of the contrast with representatives of labour unions who are elected by the same delegates upon proposal of the workers' organization. In sum, the contrast hidden behind the labour's voice raises the cost of collective decision-making, without assuring significant benefits for the absence of a professional competence of this voice.

Analogous skepticism can be found on legal grounds by Roe (1999), an impartial expert who has devoted much of his academic research in evaluating the parallel defects of the shareholder system prevailing in the US (see Roe, 1994). In his contribution of 1999, the emphasis is put on showing how the German Boardroom obstacles the functioning of an efficient securities market, thus determining infrequent Initial Public Offering (IPO) and the presence of big blockholders, with the result that German firms remain "semiprivate companies". One of the main reasons is that diffuse shareholders may be unable to ally and to create a balance of power as a counterweight to the employee block and a German securities market does not develop (Roe, 1999, p. 194 -195).

And finally, let us consider the micro econometric evidence, after having noticed that up to recently a rigorous economic analysis has been missing, and there has been little quantitative literature devoted to scrutinize the main effects of codetermination. Gorton and Schmid, two authors who have devoted a lot of their research on "class struggle" inside the German firms (as the title of one of their works suggest[17]), in a recent study pose two broad questions that focus on the heart of the problem, at least in an economic perspective. First, does high employees' representation on the supervisory board affect the performance of the firm, possibly because labour alters the firm's objective function? Second, are shareholders able to offset these distorsions - away from maximizing shareholder wealth—by taking countermeasures in attempting to offset the voting power of employee representatives? The authors try to offer some answers to both questions by studying a sample of the 250 largest Germany public companies for the years 1989-1993. What they find is that, when labour and

---

[17] See Gorton, Schmid (2000).

capital have an equal representation on the supervisory board (1/2 seats each), the companies' market to book values are lower in comparison to situations when labour representation is lower (1/3 of seats). And the losses do not reduce overtime, but range from 21% in 1989 to 43% in 1992. A rationale behind these results is that employees wield enough power to obtain private benefits of control and pursue this strategy by altering managerial remuneration, as confirmed by the weaker link, in cases of more extensive labour participation, between executive managerial compensations and company results. Moreover, employees' representatives aim at maintaining a high staffing level and wield resistance to corporate restructuring. On their part, shareholders try (unsuccessfully) to adopt countermeasures, by linking supervisory board compensation to firm performance and by leveraging up the firm, thus increasing the *cost* and *probability* of bankruptcy failures, but these countermeasures end to be "costly and imperfect."(Gorton and Schmid, 2004, p. 895).

Let us now consider a more optimistic view following the comprehensive approach followed by Hall and Soskice (2001a) and by the several contributes collected in the book they have edited and devoted to analyze the *varieties of capitalism* around the world (Hall and Soskice, 2001b). To briefly reconsider these studies, it is important to remind the relevance of the *relational* view of the firm, as the quality of the relationships the firm is able to establish is a crucial ingredient of its *dynamic capability* (Teece and Pisano, 1998). From this perspective, as suggested by Hall and Soskice (2001a), a *core distinction* may be traced between two different kinds of relationships that seem to prevail in different systems, the *coordinated* market economies and the *liberal* market economies. A distinction that shows some significant overlaps, as we will see, with the difference between a 'broad' and a 'narrow view' of the firm.

In coordinate market economies, as in the German case, extensive relational and incomplete contracting entails more reliance on collaborative relationship and on the exchange of private information. This is coherent with the view that "when complete contracts are too costly or impossible, parties settle for relational agreements that frame their relationship over time" (Morroni, 2006, p. 207). In Germany, this design is mirrored in moderate wage differentials across firms and industries that reduce the propensity of employees to change jobs, thus contributing to a compressed wage structure and to long employment tenure. The employment stability is implemented, at least at a first glance, through the functioning of two relevant labour market institutions. The first one is the industry-level wage bargaining that prevents intra - industry wage differentials and generates low spreads by firm size, thus lowering voluntary separation rates. The second one is the legal institution of codetermination at the level of the supervisory board and works councils. These arrangements, as shown in Freeman and Lazear (1994), enhance the efficiency of the firm by permitting the flows of communications between management and workers, but give *voice* to employees in their demand for lower layoffs and lower labour shedding in case of adverse shocks. In this framework, where an implicit empowerment of labour is provided, the interplay of wage and labour setting rules reveals a crucial factor (FitzRoy and Kraft, 2004). Indeed, as the study of Milgrom and Roberts (1990) has shown in a general context, insiders' involvement may generate lobbying and 'influence' costs, with negative side effects that outweight the efficiency gains obtained from better communication. One of these potential drawbacks could be a higher bargaining power over the distribution of the company results, with sub-optimal outcomes. It has been well clarified by Freeman and Lazear (1994). Assume, following the two authors, that assigning control and information rights to workers' councils increases firm's rent over the level obtained without these organizations, but assume also that these rights affect the division of rents. A clear trade off arises as the firm observes that a higher

works council power may enhance productivity and rents (a larger pie), but reduces its own share (a smaller slice). The firm' s choice is a lower sub-optimal level of codetermination since it cannot fully appropriate all the benefits from collaborative labour relations. An escape and solution to the dilemma could be to separate the factors that affect the magnitude of the surplus from those that have an impact on its division. As underlined by FitzRoy and Kraft: "the designers of co-determination seem to have been aware of these problems, because collective bargaining is formally quite separate from all aspects of codetermination (FitzRoy and Kraft, 2004, p. 6). Unlike Germany, in Japan long- term relations are enforced by long term incentives of internal promotion and by returns of seniority that magnify the high commitment of employees to company success and promote lifetime employment, thus encouraging firm-specific investments in human capital. By contrast, in Germany, as is well synthesized in Jackson, Höpner, Kurdelbusch (2006, p. 89), "training takes place within a multi-player and quasi-public system of occupational training. These skills are portable and related to broad occupations, rather than firm specific".

A synthetic representation of the different wage and employment setting rules in coordinated market economies, as Germany and Japan, with respect to those adopted in liberal market economies (US and UK) is offered by the following table:

Table 2: Comparative features of labour relations in Coordinated Market Economies (CME) and Liberal Market Economies (LME). Stability of employment, wage setting system and wage spread

Countries	Separation rate as % of new hires	Employment tenure (average tenure-years)	Bargaining level (dominant form)	Wage spread (ratio of the 9th over the 5th decile)	Ratio of remuneration of manual workers to CEO (%) (*)
CME					
Germ.	27.2	9.7	sectoral	1.64	8.8
Jap.	n.a.	11.3	sectoral	1.73	9.5
LME

What complementary institutions are necessary to implement the stakeholders-labour governance? Are only the labour regulation rules sufficient to explain the success of German and Japanese firms? Here the argument of the role played by institutional complementarities suggested by Aoki (1994), reveals to be decisive. This reminds us that the efficiency of one institution increases the efficiency of the others. Indeed, in coordinated market economies, long term employment relationships call for a " financial system capable of providing capital on terms that are not sensitive to current profitability. It suggests that nations with a particular type of coordination in one sphere of the economy should develop complementary practices in other spheres as well" (Hall and Soskice, 2001a, p. 18). Also, the option *voice* which sustains long term relationship, is related to concentrated ownership which permits to overcome the free-riding problem of dispersed ownership, since large investors are able and motivated to exercise control by obtaining significant gains by their monitoring activity. In addition inter-firm relations are relevant and are achieved by cross-shareholdings in Germany, where more than 40% of total shares of companies are owned by other non financial enterprises (see Table 3), or on business networks built on keiretsu organizations in Japan.

Moreover, bank monitoring may be a relevant element in *relational financing*. For instance, in Germany, banks and client firms maintain long term relationships since banks have access to information on firm's financial conditions (Edwards and Fischer, 1994). Thus they are able to distinguish between good and bad projects and may renegotiate with failing, but efficient firms in difficulties, thus avoiding their premature liquidations and favoring their restructuring.

Table 3: Comparative features of corporate governance in the 1990s. Concentration of ownership and of voting rights, role of banks, inter-firm relations

Countries	Concentrated ownership (average % of shares owned by the first 5 largest owners) (a)	Largest voting block (median) (b)	Role of banks as 'principals' (a)	Inter firm relations (percentage of common stocks owned by other non financial enterprises) (c)

US	25.4	5.4-8.6(*)	2.2	0
UK	20.9	9.9	0.7	1

Sources: (a), Prowse (1995); (b) Barca and Becht (2001, table 1.1) data for non financial enterprises, (c); OECD (2003). (*) the figures refer, respectively, to NYSE and NASDAQ

Summing up, the coexistence of concentrated ownership, long term oriented strategies, bank financing, inter-firm relations, industry- level wage bargaining, small wage dispersions are all significant aspects of *varieties of capitalism,* where relevant forces are present capable to implement long term relationships and the interests of a group of stakeholders. Furthermore, these coordinated economies are more oriented towards investing "in *specific* and *co-specific* assets - i.e. assets that cannot readily be turned to another purpose and assets whose returns depend heavily on the active cooperation of others", as Hall and Soskice suggest (2001a, p.17). It is not by chance, as documented by the European Patent Office, that German firms specialize in those sectors (mechanical engineering, product handling, transport, machine tools) characterized by incremental innovation, while lagging behind the US in fields (biotechnology, semiconductors, telecommunications), where innovation are more radical and represent strong discontinuities. By contrast, liberal market economies, featuring short-term relationship, tend to invest more extensively in *switchable* assets (i.e. assets whose value can be realized if diverted to other purposes). In this context, institutional complementarities work in the opposite direction. In these economies, corporate governance arrangements permit to investors who seek an immediate assurance of return of their assets to freely exert the option *exit*. These features are complementary to analogous market channels to obtain finance and are parallel to market relations and arm's - lenght exchanges of labour services. In these economies, the distinctive features of labour relationships are wage patterns linked to labour market conditions, decentralized company level bargaining, and finally no restrictions on labour adjustment. Moreover, market failures, as moral hazard and selection adverse problems, are, at least partially, solved by *explicit* incentives such as pay-performance systems or employee share ownership schemes that are introduced to enhance wage flexibility. A parallel interpretation of these findings is that remuneration schemes, as tools for corporate governance, emerge as an *indirect* control device under conditions of imperfect observability (Holmstrom, 1979), and therefore, when other *direct* control measures are absent. This proposition fits well with observed phenomena, as shown in the following table:

Table 4: Remuneration and incidence of incentive systems

Countries	Remuneration of CEOs- (US=100) 2005	Percentage of firms that offer long term incentives to CEOs- 2005			Percentage of firms that use Profit Sharing (PS) and ESOP 1990s
CME		Stock options	Restricted stocks	Bonus shares plans	
Germany	47.1	40	5	10	PS. 13% ESOP 4%
Japan	44.2	35	0	0	PS. 13% ESOP 3%
LME					
UK	54.4	80	0	60	PS. 40% ESOP 23%
US	100	85	35	35	PS. 20% ESOP 7.7% *

Sources: Towers Perrin, 2005, "Worldwide Remuneration Data" and Equity Report, OECD (2003); Poutsma (2001) and Kruse (2002); * percentage of private sector employees participating in ESOP schemes

The different remuneration *levels* among countries confirm that managerial incentives play a crucial role especially in Anglo-Saxon systems, since direct monitoring and incentive payment systems emerge as close substitutes. Furthermore, the *composition* of incentive schemes, as documented in the last Equity Report by Towers Perrin, shows that the US system tends to rely more on performance-based rewards and on long-term incentive plans, as stock options or restricted stock, which represent *explicit incentives* to pursue firms' successful strategies. These payment systems, as shown in the recent literature on executive compensation summarized in Damiani (2006), have also been an essential *selection* and *retention* tool in managerial labour markets, a very strategic tool in a context where short-term relations tend to prevail (Ittner, Lambert and Larcker, 2003; Oyer and Schaefer, 2005). These considerations may explain why their relevance is still prominent today, even after the scandal and managerial failures that have triggered the corporate governance reform undertaken in 2002 (Sarbanes Oxley Act). Moreover, their diffusion is accompanied by employee participation in profit and ownership, as well documented in Poutsma (2001) and Kruse (2002), as shown in Table 4.

However, if top executives exert their influence on compensation committees and adopt rents seeking behaviour, managerial rewards becomes not a solution, but a *manifestation* of agency problems as shown in Bebchuk and Fried (2003). In this context, all the other subordinate workers may share rent seeking behaviour and a pervasive inefficient compensation structure tends to prevail. This has serious negative implications, as suggested by Baker, Jensen and Murphy (1988): "The effect of structuring CEO contracts that are independent of performance is likely to cascade down the hierarchy - each successive layer has fewer incentives to structure effective contracts than the prior layer. The absence on incentives is pervasive, and it's not surprising that large organizations typically evolve into bureaucracies" (Baker, Jensen and Murphy , 1988, p. 614).

In Germany and Japan, where management control is easier and less expensive and lifetime commitment is higher, executive rewards are lower. Moreover, in these countries the lower *level* of managerial salaries is accompanied by a *weaker link* to company performance (Table

4) and the wide diffusion of stock options and bonus shares paid not only to CEOs but also offered to all 'agents' is absent. Furthermore, the analysis of the German 100 largest companies shows a clear positive correlation between shareholder value orientation of these enterprises and incentive orientation of their payment schemes for non executive employees (Jackson, Höpner, Kurdelbusch, 2006, pp. 106-112). This wide diffusion is, on the other hand, very often recorded in the US and the UK, where Profit Sharing Schemes and ESOP Plans[18] are paid to a broader base of dependent employees (Table 5).

The previous analysis confirms that the diffusion of forms of financial employees' participation has not been a part of a "package of participation" in control rights. This sort of bifurcation between *payoff* and *control* rights has been well documented by the vast participation literature (Uvalic, 1991; Poutsma, 2001; Pérotin and Robinson 2003; Uvalic, 2006). As stressed in Uvalic (2006), "although traditionally the main arguments in favour of financial participation were motivated by objectives such as greater equality in the distribution of income and wealth, and improving relations between workers and capitalists, today these schemes are considered as part of a new culture of industrial relations based on innovative managerial strategies and more flexible remuneration policies, which should ultimately result in increased enterprise efficiency" (Uvalic, 2006, p. 50). The majority of studies in this field have shown how the wide diffusion of various forms of financial employee participation has performed with the main aim to enhance wage flexibility, to achieve productivity gains and to implement a risk-sharing device. This explain why they have found a natural space in liberal market economies, more than in coordinated market economies. On the other hand, there are not conclusive results on the positive impact of a larger involvement of employees in decisional processes in terms of productivity gains, and only some studies (see Conte, Svejnar, 1990) are capable to confirm the positive interactions between the various forms of participation. In any case, the debate on advantages and disadvantages of employee financial participation, as overviewed in Uvalic (2006), has mainly concerned issues such as workers' incentives, wage moderation, promotion of firm-specific human capital investments - via long-term labour contracts, lower intrafirm conflicts - less inequalities, risk sharing properties. But it must be admitted that this is a clear 'shareholder' perspective, one in which theorists and econometricians have the hard task to prove that "wage premiums pay by themselves".

On the contrary, in a 'stakeholder' view one of the main claims should be that "if employees have no input into decision, they are exposed to moral hazard on the part of managers, who may make decisions that affect pay or wealth negatively. The problem is potentially more severe with employee share ownership than with simple profit sharing…" (Pérotin and Robinson, 2003, p. 11).This is the preferential attitude declared, in 2004, by the OECD Principles of Corporate Governance where it is said that "the corporate governance framework should permit performance enhancing mechanisms for stakeholder participation"(OECD, 2004, section IIIc). To what extent this participation has been reached may be, at least partly, assessed by the diffusion of the various forms of participation all over the countries, as well documented in the 2003 OECD survey, one of the few that devotes a section to describe the diffusion of stakeholder protections.

---

[18] As clarified in Uvalic (1991, p.10) ESOPs "… involve a bank (or other lender) lending money to an employee benefit trust, which acquires company stock that is allocated by periodic payments to each employee's ESOP account".

Table 5: Control rights and payoff rights of employees

Countries	Employees appoint some board members (a)	Mandated Works Councils Statutory threshold (b)	Decision making power (c)	Diffusion of financial participation schemes % of private and public fi8rms with Employee Share Ownership Plans (ESOP) and Profit Sharing (PS)
Austria	Yes	5 employees*	Personal matters	ESOP: small number of ESOP PS: n.a.
Belgium	No	100 employees	Work regulations, recruitment, dismissals, welfare and holidays	ESOP: Selective application in specific companies PS: mainly by multinational firms
Denmark	Yes	35 employees	Working conditions, personnel policy and training	ESOP: 6% PS: 10%
Finland	No	30 employees	None	ESOP: n.a PS: small number of companies
France	No	50 employees	Management of all company welfare schemes	ESOP: 7% PS:57%
Germany	Yes	5 employees*	Social welfare, personnel policies and economic affairs	ESOP: 4% PS: 13%
Ireland	No	No	n.a.	ESOP:4 % PS: 8%
Italy	No	15 employees	-	ESOP:3 % PS: 4%
Japan	No	No	n.a.	ESOP:3 % PS: 13%
Netherlands	Yes	50 employees	Rules concerning employees benefits, working hours, holidays, health and security, recruitment, dismissals and training	ESOP: 3% PS: 13%

2.2 Conclusion

In shaping governance and labour management in a stakeholder society, a whole set of institutional factors, much more than the sole codetermination arrangements, are shown to be crucial. In this context the role of institutional linkages and complementarities may offer a fruitful line of research, as this perspective leaves a natural space to reconsider the full range of opportunities left to labour coalitions with the other two actors, capital and management. After all, as noticed by Pagano and Volpin (2005, p.841) "*Labor economists* view industrial relations as being shaped by the conflict between workers and management. *Financial economists* view corporate governance as the outcome of the diverging interest of shareholders and management. Actually, these two conflicts are present simultaneously and interact". Indeed as seen in the previous sections, the comparison of the various forms of capitalism reveals the potential drawbacks when workers are natural allies of managers and become accomplices of their misconduct. In this scenario, the traditional conflict between capital and labour may be replaced by a new conflict between *strong* insiders (management, employees, blockholders) and *weak* outsiders (small shareholders). In this scenario, the 'broad view' of the firm does not represent a remedy to externalities and sub-optimal results, but on the contrary it may be at the origin of new failures. In any case, as noticed by Coffee (2005), in the last decade, the different economies, the coordinated market economies as well as the liberal market economies, have witnessed different forms of failures and scandals. However, they have shared a common feature represented by a bad performing function of their respective governance gatekeepers. Enron and Parmalat, from their respective sides, offer dramatic but instructive lessons. In this scenario, where the eventual convergence[19] toward a unique system of corporate governance may represent the menace of a convergence toward a uniform kind of failures, labour may assume a potential role as a *natural guardian* of firm accountability. Control by empowered employee representatives could contribute to mitigate opportunistic behaviour and rent seeking by managers and to reduce private benefits of control accruing to blockholders. After all, if we conceptualize the firm as a set of *multilateral* contracts over *time*, and admit that employees sign implicit and explicit agreements with the other parts, their rights to bargain over the distributive effects of these agreements must be acknowledged. In this context, the condition of a *fair* contract is required. As Freeman suggests in his ´stakeholder interpretation' of corporate governance, one device for obtaining fairness is the Rawlsian 'veil of ignorance':

> *"Our common sense notion of fairness is illustrated by the problem of dividing a cake into two pieces for two individuals. The 'fair' solution is for one individual to cut the cake and choose last, or put another way, to cut the cake without knowing which piece he will receive in the end... Interpreting fairness as taking place behind the veil of ignorance is consistent with the spirit of transaction cost economics, since it must take into account both ex post and ex ante perspectives. It would be irrational for stakeholders to give up the ability to participate in monitoring the actual effects of the firm on them... "* *(Freeman, 1990, p. 357).*

---

[19] The 'convergence' issue is still controversial and open to debate; for instance, for the German case Jackson, Höpner, Kurdelbusch (2006) stress that "a more marketized role of capital has led to changes toward marketized employment relations in Germany". However, the author stress that "the diffusion of shareholder value has not undermined the core institutions of German industrial relations, namely codetermination and collective bargaining" (pp. 117-118).

1. INTRODUCTION

The successful integration of firms from transitional economies into the European Union market mostly depends on these firms' competitive position vis-à-vis both its domestic and foreign competitors. Therefore, regardless of the prevailing stream in the management theory the process of ensuring a firm's competitiveness is and always has been the nucleus of the work of firms' top managers. After the introduction of the so-called stakeholder theory (Freeman, 1984) more and more authors adopted a 'multi-stakeholder' view of a firm, recognizing that owners are only one of many interest groups in and around a firm. At the same time a considerable shift from strictly profit-oriented firms to more socially responsible and ethical firms took place. In the paper we build on presumption that even in this new business environment a firm's primary strategic goal needs to be its long-term competitive advantage. This can be supported by empirical studies of many authors (Buble et al., 2003; Pučko, 2002; etc.) who show that practicing social responsibility and business ethics is more often a strategic goal of stable and successful firms.

Although the positive link between a firm's competitive advantage and its performance is too often simply taken for granted (some authors even treat both constructs as synonyms), it must be noted that competitive advantage and superior performance are actually two different things. Given the great importance of the topic it is necessary that both theory and practice correctly understand the basic concepts related to a firm's competitiveness. The purpose of this paper, which builds mainly on a detailed analysis of the related literature, is to thoroughly and completely elucidate the main conceptions related both directly and indirectly to competitive advantage at the firm level. In so doing, we wish to contribute to a clearer understanding of this wide scientific field. To meet these objectives, we first define competition, competitiveness, competitive advantage and sources of competitive advantage. After introducing these basic concepts, we continue with a short overview of the different levels at which competitive advantage can be discussed. The paper's central part provides a detailed argumentation on how the fundamental forms of competitive advantage should be classified. At the end, we conclude by proposing some fundamental conditions that need to be met if a firm is to build up a solid competitive advantage. By comparing our thoughts with the theoretical and empirical findings drawn from the literature, we believe some new insights can be offered to scholars and researchers in the area of competitiveness.

2. COMPETITION, COMPETITIVENESS, COMPETITIVE ADVANTAGE AND SOURCES OF COMPETITIVE ADVANTAGE

Competition can be defined as either a process or a state. The former understanding is closer to classic economic theory, whereas the second is closer to the neoclassical one. If competition is understood dynamically, i.e. as a process, its essence can be described as a competitive battle. Even in the 18th century Adam Smith saw competition as a contest by virtue of which two suppliers are forced to sell more cheaply than they would have sold had there been only one of them in the market (Campbell, Skinner, 1976, pp. 361-362). Competition as a competitive battle has also been discussed by several other well-known authors. Marx (1976, pp. 165-172), for example, saw competition as the struggle for existence between capitalists, which are (in order to survive) forced to reduce their costs and prices. Similarly, Capoglu (1991, p. 6) understood competition as a survival process in which firms must constantly innovate. Schumpeter also emphasized the role of innovation. More specifically, he explained the competitive battle through the development of new technologies, new sources of supply, new products and new forms of firm organization (Baldwin, 1995, pp. 1-29). Schumpeter's approach was distinct in that it emphasized that non-price competition is at least as important as price competition (Schumpeter, 1947, p. 84). Similarly, creativeness and innovativeness are also fundamental starting-points of Porter's (1985) concept of a firm's competitive advantage.

On the other hand, advocates of the static understanding of competition explain it as a competitive system defined by several structural characteristics of the market (such as the number of suppliers, the level of homogeneity of goods, the mobility of factors of production etc.) (Prašnikar, Koman, 1996, p. 51). Cournot (1938, p. 101) defined competition as a state in which the process of competition reaches its boundaries, i.e. when the production of a single supplier becomes unimportant compared to total production in the industry. This understanding of competition is (as mentioned) closer to neoclassical economic theory, which defines competition as a prevailing market structure. Neoclassical economists therefore divide competition into perfect and imperfect which means they define it using static criteria such as the number of firms, coefficients of concentration etc. (Makovec-Brenčič, 2000, pp. 16-17). Although neoclassical economic theory's development was based on the classical one, its understanding of competition differs considerably.

To understand the whole topic more clearly, we also define the terms competitiveness, competitive advantage and sources of competitive advantage. Competitiveness, as a derivative from competition, can be defined as an attribute of something that is competitive. Noe et al. (1994, p. 2) saw a firm's competitiveness as its ability to defend and increase its market share compared to other firms in the industry. On the other hand, the competitiveness of a country is usually defined as its ability to sell in domestic and foreign markets (as a consequence of changes in costs, prices and other factors) (Balassa, 1985, p. 27) or its ability to create greater wealth than other countries (Makovec-Brenčič, 1996, p. 70). A similar definition is offered by the World Economic Forum (1997, p. 12), which defines a country's competitiveness as its ability to assure permanently high growth rates of GDP per capita.

Some authors (see, e.g., Makovec-Brenčič, 2000, p. 33) believe that competitiveness can only be reasonably discussed at the country level. Based on our previous conclusion that competitiveness is an attribute of something that is competitive, we naturally cannot agree with them. Clearly, the term competitiveness cannot be reserved for the country level but

rather, or even better, especially for the firm level. In spite of the unresolved dilemma about the level[1] at which the discussion on competitiveness makes most sense, we believe at this point we should emphasize that when discussing competitiveness we should not forget it is a relative concept. In other words, we cannot discuss competitiveness without comparing a firm or a country with another firm or country. This relativity is especially important because, as we explain in the following paragraphs, the term competitive advantage should also be seen as something relative.

In the literature one can find many different definitions of competitive advantage. Hyvönen (1995, p. 334), for instance, defines competitive advantage as a unique position a firm develops in comparison with its competitors. Bamberger (1989, p. 80) further explains that outward evidence of a competitive advantage is a position of superiority in an industry or market, whereby that superiority depends on how customers perceive it. Pilling (1991, p. 55) also sees the essence of competitive advantage in the creation of a positional[2] advantage, which usually leads to a firm's superior performance. Although accepting the understanding that having a competitive advantage means having a superior position in comparison with competitors, Duncan, Ginter and Swayne (1998, p. 7) warn that such an understanding can sometimes be dangerous in the sense that a firm that once possessed an advantage becomes passive. Therefore, firms must understand that its superior position can quickly be lost if a firm does not continuously maintain it and/or if it fails to respond to changes (Christensen, 2001, p. 105).

Although almost every author offers a somewhat different definition of competitive advantage, we believe that the vast majority of the literature emphasizes two common attributes of the term, i.e. 'positional' understanding of the competitive advantage and competitive advantage as a relative concept. Although the positional understanding seems to prevail in the literature, there are other authors (see, e.g., Day, Wensley, 1988, p. 2; Ma, 2000b, p. 54) who understand competitive advantage as an advantage in a firm's resources and capabilities (i.e. in what we call the sources of competitive advantage (Čater, 2001, pp. 64-74)). On the other hand, the relativity of competitive advantage is already indicated by the term 'competitive advantage' itself. The term clearly indicates that we are dealing with a relative comparison of a firm (which has a certain advantage) with its competitors (Ma, 2000a, pp. 18-19). Since 'what to compare' and 'who to compare with' are also two basic questions of benchmarking (Clayton, Luchs, 1994, p. 54; Antončič, 1996, p. 69), we can say that the process of analyzing a competitive advantage is in fact similar to the benchmarking process.

Naturally, in order to create a competitive advantage certain foundations for it must exist (or must be created) in a firm. In this paper, such foundations are labeled 'sources of competitive advantage'. As there is no well-articulated definition of these sources in the literature, we try to depict them by comparing them with the foundations of a house. Just as we can say that a house is safe only if it has quality foundations, we can also say that a competitive advantage is sustainable only if its sources are appropriate (i.e. stable, unique, hard to imitate etc.). In other words, a competitive advantage does not exist by itself unless a firm creates it. There are only certain sources (conditions) for the creation of a competitive advantage and it is up to each firm how it will exploit these conditions and what kind of competitive advantage it will create (Anthony, Perrewe, Kacmar, 1996, p. 468). Naturally, the sources of competitive advantage

---

[1] A more detailed discussion of competitiveness and competitive advantage on the country, industry and firm levels appears in the next section.

[2] A more detailed examination of a 'positional' competitive advantage is given in Ma (2000b, p. 53).

can rapidly change. Therefore, a source that used to be relevant in the past may be irrelevant today (Lee, Ulgado, 1996, p. 10; Slater, 1996, p. 83). That is why firms are constantly forced to seek and create new sources of competitive advantage (Makovec-Brenčič, 1997, p. 42).

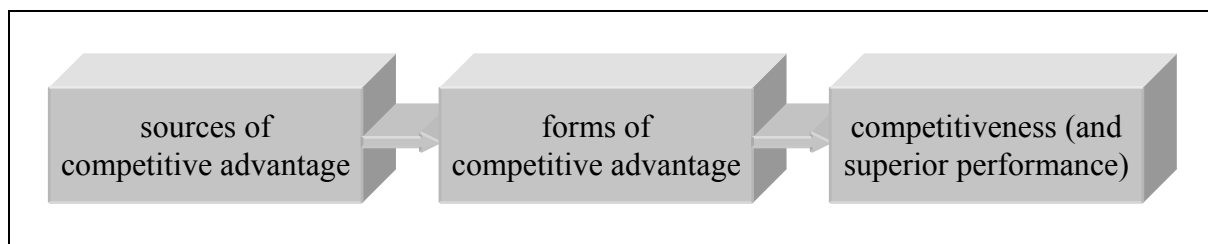
From the above discussion the connection between the terms defined in this section should be clear. As shown in Figure 1, certain sources of competitive advantage must first exist. If a firm knows how to exploit them a competitive advantage (in at least one of many of its forms) is created. This advantage then enables the firm to achieve the state of competitiveness and consequently outperform its competitors.


Figure 1. Relationship between the discussed concepts

3. DIFFERENT LEVELS OF DISCUSSION ON COMPETITIVE ADVANTAGE

Although competitive advantage is usually discussed at the firm level, for the sake of completeness we should mention that this level is not the only one possible. Scientific literature (see, e.g., Makovec-Brenčič, 2000, pp. 38-83) usually mentions three main levels of discussion, i.e. the country, industry and firm levels.

Chronologically, the concept of competitive advantage was first discussed at the country level. Many authors tried to answer the question of why countries trade. Clearly included among the most popular concepts here are Adam Smith's theory of absolute advantage, David Ricardo's theory of comparative advantage and Eli Heckscher's and Bertil Ohlin's theory of comparative advantage based on factor proportion (Appleyard, Field, 1995, p. 170; Makovec-Brenčič, 1998, p. 35; Kumar, 1999, pp. 78-92). These and some other theories that deal with competitive advantage at the country level cannot of course be discussed in detail here for that would exceed the limits of the paper. We need to mention, however, that the discussion of competitive advantage at the country level is still very much 'alive'. This can be seen from the many attempts to measure countries' competitiveness in the scientific literature (see, e.g., Dimovski, Zager, 1995, pp. 570-587; Jeggers, 1995, pp. 115-141; Esser et al., 1996, pp. 27-90). Based on complex methodology and by using many different indicators the competitiveness of countries is also measured annually by well-known global organizations such as the World Economic Forum (in its publication Global Competitiveness Report), the International Institute for Management Development (in the publication World Competitiveness Yearbook) etc.

In spite of the debates on country-level competitive advantage, we join those critics who believe that such a discussion is at least dubious if not inappropriate and that the only logical level to discuss competitive advantage is the firm level (Kogut, 1985, p. 26; Krugman, 1987, pp. 41-42; Fröhlich, 1989, pp. 21-41; DuBuis, Oliff, 1993, pp. 31-41; Krugman, 1996, p. 18). Krugman (1994, p. 44), for example, claims that competitiveness is not a relevant term when we discuss different national economies. A country, however, still has an important role in creating good or bad conditions for firms in their attempt to compete in the global market (Krugman, 1987, p. 42). The same logic forms the essence of Porter's belief that firms and not

countries compete in the global market (Porter, 1990, p. 619). Although he also talks about the competitive advantage of nations[3], a closer look reveals that the competitiveness of a nation is in fact built on the competitiveness of the firms within the national economy. The cornerstones forming the diamond of the nation's advantage can therefore be regarded as characteristics of the macroeconomic environment that have an important influence on the creation of firms' competitive advantages in the national economy.

Similarly as with the country level, we can also doubt the reasonableness of a discussion of competitive advantage at the industry level. In other words, can we really say that a certain industry has a competitive advantage over another industry? In the literature several authors can be found who not only believe in competitiveness at the industry level but also try to measure it. There are many empirical studies that concentrate on the competitiveness of specific industries, above all the automobile industry (Fahy, 1997), the pharmaceutical industry (Henderson, Cockburn, 1994), the processing industry (Hughes, Hare, 1994) etc.

With regard to competitive advantage at the industry level we also feel obliged to warn about the sometimes-misunderstood interpretations of Porter's ideas regarding the structural parameters of an industry. The concept's basic idea is clearly not the measurement of the competitive advantage of one industry over another. Porter's message simply concentrates on the idea that firms in any industry are directly influenced by five competitive forces, i.e. the bargaining power of buyers, the bargaining power of suppliers, the threat of substitution, the threat of new entrants and the existing rivalry in the industry (Porter, 1979, p. 141). The combination of the five forces defines the circumstances in which firms operate and consequently also their profit potential. The central level on which competitive advantage is built is therefore, once again, the firm level. Whether or not it is reasonable to discuss competitive advantage at the industry level this is certainly less relevant and less reasonable than a discussion of competitive advantage at the firm level. The reason is, of course, that firms compete in the market and industries do not. Even if we imagine that industries compete for a limited amount of consumption, the fact remains that behind the 'competition between industries' there is competition between firms from different industries.

Based on the above discussion, the firm level is the only undisputed[4] and possibly also the only reasonable level on which competitive advantage can be discussed. By that we do not of course wish to ignore the important role of the country and industry levels, since both can contribute significantly to creating the appropriate business environment. Since a detailed discussion of firm-level competitive advantage is the focus of the next section, at this point we only wish to emphasize that some authors (Schill, McArthur, 1992, p. 6; Kolar, Tomažič, 1993, p. 97; Završnik, 1994, pp. 145-146; Makovec-Brenčič, 2000, p. 83) discuss several sub-levels[5] of firm-level competitive advantage. These sub-levels are:

(1) competitiveness of a group of co-operating firms;

(2) competitiveness of the firm as a whole;

---

[3] Here, we refer to the book 'The Competitive Advantage of Nations' published in 1990.

[4] Here, indisputableness refers to the fact that in the scientific literature we were unable to find a single author who would not allow the discussion of competitive advantage at the firm level.

[5] In this respect, Schill and McArthur (1992, p. 6) believe that the order of creating a competitive advantage is as follows: product/service → (strategic) business unit → firm (corporation) → group of co-operating firms (corporations).

(3) competitiveness of a (strategic) business unit within the firm;

(4) competitiveness of a broad group of products/services; and

(5) competitiveness of a product/service, which can be objectively compared with a competitor's product/service and for which the firm can calculate the financial result.

Of these five sub-levels discussions of the competitiveness of a product/service are probably the most common in everyday business life. This comes as no surprise if we acknowledge that a firm cannot have a competitive advantage unless it sells certain products/services. Besides, the determination of the advantage of a product/service (for instance, with regard to its design, price etc.) over a competitor's product/service also makes perfect sense. Although we have emphasized that the core level of discussion of a competitive advantage should be the firm level, an additional explanation is needed. Namely, when discussing a firm's competitive advantage we should not always look at the firm as a legal unit. This is especially true when we deal with large diversified corporations, i.e. those involved in several quite different businesses, each organized as a separate strategic business unit. In this case, it usually makes more sense to discuss competitive advantage at the strategic business unit level (Porter, 1987, p. 46) than the corporate level.

4. TWO FORMS OF COMPETITIVE ADVANTAGE: LOWER PRICE AND DIFFERENTIATION

4.1. The argumentation of lower price and differentiation as two forms of competitive advantage

In defining the forms of competitive advantage we follow two logical assumptions. First, competitive advantage is built based on certain sources of competitive advantage and, second, competitive advantage is reflected in a firm's superior performance. While the former emphasizes the difference between competitive advantage and its sources, the latter clearly indicates that competitive advantage is not a synonym for superior performance. Since customers are the ones that make a firm's operations and progress possible, the whole idea of competitive advantage should in fact be analyzed from their perspective. For example, a firm can produce superior products but, so long as the customers do not perceive them as superior, the firm is unlikely to gain a competitive advantage and outperform its competitors. The above understanding of competitive advantage brings us to the conclusion that firms have to compete on superior customer value delivery. They can offer superior value to customers by offering similar products and services as the competitors at a reduced price or by differentiating themselves from the competitors, i.e. by offering something the competitors cannot offer at all or cannot offer in a specific desired way (for example, in a very short time). Two of the main forms of competitive advantage are therefore lower price and differentiation. The above understanding of the two basic forms of competitive advantage can be labeled 'positional' as its essence is the creation of a superior position vis-à-vis the competitors in the eyes of the customers. In other words, in comparison with the competitors a firm must try to either offer customers greater value for the given amount of money or offer them the same value for a smaller amount of money (Woodruff, 1997, p. 139).

If we agree with the positional definition of competitive advantage from the customers' point of view, it becomes clear why resources, capabilities and knowledge cannot be understood as a competitive advantage of a firm, as proposed, for example, by Day and Wensley (1988, p. 2) and Ma (2000b, p. 54). The reason is that a firm's resources cannot generally be seen by its customers. Even if they can be seen, the customers would not remain loyal to a firm solely because of its superior resources unless the firm offers the customers greater value, i.e. something the customers perceive as an additional benefit or value for themselves. A firm's resources, capabilities and knowledge should therefore not be understood as forms but rather as bases or sources of a firm's competitive advantage.

A similar logic can also be applied to explain why one of the two forms of competitive advantage is lower price, as suggested by Kotha and Vadlamani (1995, p. 76) and Swann (1994, p. 24), and not lower costs, as interpreted, for instance, by Porter (1985, p. 11; 1991, p. 101), Bamberger (1989, p. 80), and Pitt, Ewing and Berthon (2000, p. 12). Although it is important to acknowledge this dilemma, we still should not spend too much time and space discussing it. In fact, the dilemma is more a question of comprehension rather than the contents as it is clear that a firm cannot offer a lower price in the long term unless the lower price is supported by lower costs. In spite of all of this, we define lower price as one of the two basic forms of competitive advantage, and not lower costs. The main reason for this is, as explained by Mintzberg (Kotha, Vadlamani, 1995, p. 76), unless accompanied by lower price cost leadership does not contribute to superior customer value and hence does not provide an advantage in itself. It is therefore better to treat lower price as a form of competitive advantage while simultaneously being aware that, at least in the long run, lower price must be based on lower costs. But if lower price is a form of competitive advantage, what then are lower costs? Can lower costs then be regarded as some kind of source of competitive advantage? We do not accept this. Although lower costs can allow a firm to reduce the price of its product/service, they are still not the true source of competitive advantage. Instead, they should be understood as a result of the true sources of competitive advantage such as unique resources, capabilities and knowledge (based on which a firm is able to achieve lower costs per unit of a product/service).

In this paper we therefore treat lower price and differentiation as two main forms of competitive advantage. Especially with regard to differentiation the literature discusses several of its forms. Of these, the greatest stress is usually placed on (Kotha, Vadlamani, 1995, p. 76; Sashi, Stern, 1995, p. 126; Helms, Ettkin, 2000, p. 1) (see Figure 2):

(1) Superior product/service. Probably the most important aspect of a firm's differentiation is the differentiation of a product/service. In short, it involves offering the customer a better product/service than the competitors.

(2) The totality of supply. A firm differentiates itself by offering a broad product line and supplying a customer with support and complementary products/services.

(3) Speed. Today, the customer usually demands that a product be delivered as quickly as possible. Fast response and delivery are therefore important aspects of differentiation. Not only do they attract new customers but they also enable the firm to (at least for a short period) charge a higher price (Kumar, Motwani, 1995, p. 51) and achieve better performance (Wagner, Digman, 1997, p. 345).

(4) Flexibility. Another important aspect of differentiation is the flexible satisfaction of specific customer needs, especially if the competitors do not have the will and/or power to satisfy such needs.

(5) Positive image of a firm. A firm can differentiate itself from its competitors simply by 'selling' a positive image of itself (for example, if a customer acknowledges a firm's positive attitude to the environment etc.).

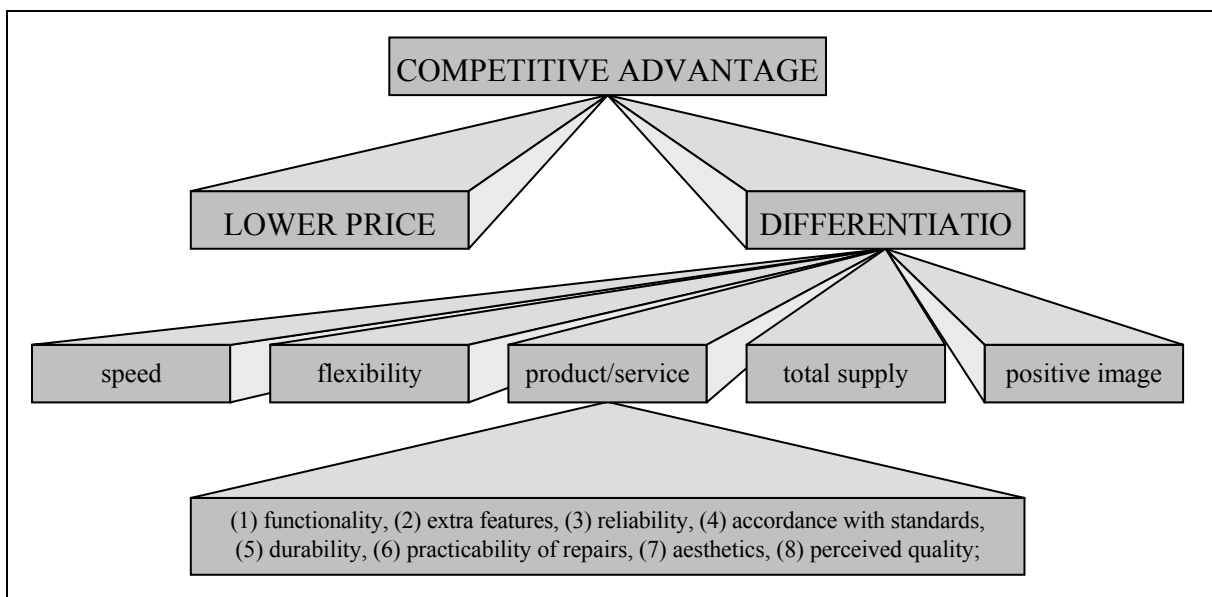
With regard to the superiority of a product/service the literature usually classifies this form of differentiation even further. This classification is based on different dimensions of the superiority (quality) of a product and/or service. In most cases, the following eight[6] dimensions of quality are outlined: (1) functionality; (2) extra features; (3) reliability; (4) compliance with standards; (5) durability; (6) practicability of repairs; (7) aesthetics; and (8) perceived quality[7] (Garvin, 1987, pp. 104-108). Although some authors (see, e.g., Reed, Lemak, Mero, 2000, pp. 5, 12) believe that improved quality can lead to a competitive advantage, it seems that the majority of researchers doubts this. Their basic argument is that all firms emphasize quality today. The emphasis on quality is therefore a 'necessity' rather than a 'supplement'. In addition, most elements of quality can easily be imitated and hence cannot represent a long-term competitive advantage (Powell, 1995, p. 15). For this reason, Mlakar (1998, p. 71) prefers to use the term excellence (rather than quality) as a crucial factor of competitiveness and superior performance. Therefore, to be able to discuss quality as one of the forms of differentiation the quality involved must really be extraordinary. In other words, the advance in the value received by the customer must be considerable Swann (1994, p. 24).


Figure 2. Forms of competitive advantage of a firm

---

[6] When dealing with firms in the service sector, another important dimension of quality is often mentioned, namely the continuity or consistency of services (Coyne, 1993, pp. 4-6).
[7] Due to the heightened ecological awareness of customers in recent years, the perceived quality of a product/service increasingly depends on an ecology-related differentiation, i.e. on the extent to which a firm's product/service is environmentally-friendly compared to the competitors' products/services (Reinhardt, 1998, p. 68).

Before moving on to discussing the relationship between competitive advantage and business strategy one final dilemma regarding the two forms of competitive advantage, lower price and differentiation, needs to be briefly addressed. Namely, can lower price also be treated as just another form of differentiation? The answer here can definitely be affirmative. Therefore, we can agree with Mintzberg who labels price advantage 'differentiation by price'. His argument is that price, like with design, functionality etc., is just another attribute of a product/service (Kotha, Vadlamani, 1995, p. 76). The question is definitely interesting but as long as we are aware of the essence of the dilemma it does not really matter whether we call it a 'competitive advantage in lower price' or a 'competitive advantage in differentiation by price'. Therefore, the decision to use the terminology presented in this paper, i.e. to discuss lower price and differentiation as two basic forms of competitive advantage, was based on the fact that such terminology is already more widely used in the literature (and therefore creates less terminological confusion). In addition, the term 'lower price' is more specific and self-explanatory than the term 'differentiation by price' as differentiation by price can include both higher and lower price.

4.2. The relationship between competitive advantage and business strategy

Of the many classifications of business strategies, Porter's generic[8] business strategies are undoubtedly the most frequently discussed in the literature. The core idea of the concept is that a firm can choose between three potential strategic approaches to outperform its competitors in an industry, namely: (1) cost leadership; (2) differentiation; and (3) focus (based either on low costs or on differentiation) (Porter, 1980, p. 35). Porter's classification is based on a combination of two dimensions, the type of competitive advantage (lower costs or differentiation) and the competitive scope (broad or narrow market).

For the purposes of this paper an important question is whether a firm can implement more than one generic business strategy simultaneously. Porter (1980, p. 35) strongly suggests that (except in some rare specific conditions) a firm should not choose more than one generic strategy because implementing any of them requires total commitment and supporting organizational arrangements that are diluted if there is more than one primary target. If a firm fails to develop its strategy in one of the three directions, it is said to be 'stuck in the middle' and is almost guaranteed low profitability. Based on an extensive review of the literature, we may conclude that the dilemma is still relatively unsolved and is often the centre of disagreement between authors. Besides Porter, the idea of pursuing only one generic business strategy at a time is also supported by Campbell-Hunt (2000, p. 131). On the other hand, many authors (e.g., Wright, 1987, p. 96; Hill, 1988, p. 411; Murray, 1988, pp. 395-397; Faulkner, Bowman, 1992, pp. 496-497; De Castro, Chrisman, 1995, p. 172; Wright et al., 1995, pp. 147-148; Yamin, Gunasekaran, Mavondo, 1999, p. 516; Pitt, Ewing, Berthon, 2000, pp. 13-14) believe that a firm can (or even must) implement more than one generic business strategy simultaneously.

The above brief presentation of the concept of generic business strategies was required to better understand the relationship between competitive advantage and generic business strategies. This relationship is often imprecisely presented in the literature. Above all, some authors do not clearly distinguish between differentiation as a business strategy and

---

[8] Porter described the three strategies as 'generic', which refers to their validity in all business environments. The studies carried out by Murray (1988, p. 390) and Miller and Dess (1993, p. 558), however, do not support that. For this reason, the authors believe that Porter's strategies only apply in specific environmental conditions, which means they can only be contingent and not generic.

differentiation as a form of competitive advantage. Similarly, they tend to mix cost leadership as a business strategy and lower price as a form of competitive advantage. Although the two concepts are closely related, it is absolutely necessary we understand why they are different. Namely, competitive advantage is, as already explained, a positional advantage in an industry or a market. On the other hand, the business strategy (be it cost leadership or differentiation) is only a business orientation which, if properly implemented, promises that strategic goals will be met (Pučko, 1999, p. 173). Therefore, if properly implemented the cost leadership (differentiation) strategy enables (but does not automatically assure) a firm to develop a competitive advantage in the form of a lower price (differentiation).

4.3. The dilemma of simultaneous price and differentiation advantages

Before dealing with the dilemma of simultaneous cost and differentiation advantages, we first need to ask ourselves about the costs of differentiation. Usually differentiation demands a certain increase in costs which, at least in the long run, also requires an increase in price. The reason for the increase in costs of a differentiated product/service can be ascribed to the need to perform the required set of activities differently or even to replace certain activities in the set. For instance, the prolongation of a product's life requires the use of better and hence more expensive materials. Naturally, not all types of differentiation are equally expensive. For example, differentiation based on the improved co-ordination of interrelated activities can be very cheap or even free, whereas adding extra features to a product usually requires much more money (Porter, 1985, pp. 127-128).

By saying that differentiation often requires an increase in costs and prices, we of course do not wish to imply that the inverse situation, i.e. a decrease in costs as a result of differentiation, is impossible. Sometimes making the set of activities unique also simultaneously cuts the costs. Negative costs of differentiation may, for example, be the result of the vertical and/or horizontal integration of a firm. Where achieving differentiation and reducing costs can take place simultaneously this suggests one of the following (Porter, 1985, p. 129):

   (1) a firm has not been fully exploiting all its opportunities to reduce costs;

   (2) being unique in an activity was formerly judged undesirable; or

   (3) a significant innovation has occurred which competitors have not adopted such as an automated process that both lowers costs and improves quality.

When we discuss the costs of differentiation we must not forget about the costs of quality. Ever more authors (see, e.g., Belohlav, 1993, pp. 60-61; Terziovski, Samson, 1993, pp. 15-16) agree that the traditional thinking that improving quality is expensive is wrong because it reflects an incomplete understanding of quality-related costs. More specifically, such thinking fails to take into consideration the costs of bad quality (for instance, costs due to lost customers, costs due to a bad reputation, the costs of mending and warranties etc.). These costs are said to be even higher than the costs of improving quality but have long been underestimated (probably because it is difficult to quantify them).

While the literature does not provide any clear answer as to whether more than one generic business strategy should be implemented at a time, the situation is much clearer with regard to simultaneous competitive advantage in both lower price and differentiation. In other words,

the idea of 'pure' generic business strategies does not directly interfere with the idea of a simultaneous cost and differentiation advantage. Indeed, a firm should normally concentrate on only one of the generic business strategies, yet it could still find itself in a position (for example, due to rare and valuable resources) of having a simultaneous cost and differentiation advantage. We can therefore agree with those authors (see, e.g., Flynn, Schroeder, Sakakibara, 1995, p. 666; Flynn, Flynn, 1996, pp. 370-374) who claim that a firm can offer a superior (differentiated) product at a lower price. In addition, Karnani (1984, p. 377) believes both forms of competitive advantage are continuums on which more of one can be a substitute for less of another (trade-off). This means a firm's competitive advantage results from an appropriate combination of a firm's price (cost) and differentiation position.

4.4. The relationship between competitive advantage and firm performance

Although competitive advantage and performance are undoubtedly two closely related concepts, we wish to specifically emphasize that we do not agree with those authors (see, e.g., Buckley, Pass, Prescott, 1988, p. 176; Francis, Tharakan, 1989, p. 9; Kolar, Tomažič, 1993, p. 99) who treat them as synonyms (Ma, 1999, p. 259). Instead, we believe that competitive advantage is a necessary condition for superior firm performance (Spanos, Lioukas, 2001, p. 919). A review of the relevant literature reveals that most authors (see, e.g., Piercy, Kaleka, Katsikeas, 1998, p. 384; Spanos, Lioukas, 2001, p. 919) agree on the positive influence of a competitive advantage, particularly in the form of product/service superiority (Peach, 1992; Kroll, Wright, Heiens, 1999, p. 381) and speed (Sullivan, Kang, 1999, p. 1) on a firm's performance. On the other hand, only a few believe that competitive advantage does not always result in superior performance (Coyne, 1986, p. 60; Ma, 2000a, pp. 24-26) because the rents (as a consequence of the competitive advantage) can be appropriated by different individuals (Coff, 1999, p. 120). Where they are, for example, appropriated by employees this will result in higher salaries and not in a firm's superior financial performance (for instance, return on equity).

With regard to the relative influence of price and differentiation advantages on a firm's performance, there seem to be several authors who believe that a differentiation advantage leads to greater firm performance than a price (cost) advantage. Caves and Ghemawat (1992, p. 11), for example, claim that a differentiation advantage (especially in the form of a superior product and broad product assortment) enables a firm to realize greater profits than a cost (price) advantage although, on the other side, cost (price) advantage usually leads to a greater market share. Similar results are also reported by Doyle and Wong (1998, p. 524), who studied the characteristics of successful firms and found that one of their common characteristics is their permanent desire to differentiate themselves from their competitors. This is probably the main reason why in the literature from the 1970s onwards the discussion on competitive advantage primarily focuses on different forms of differentiation (Kumar, Motwani, 1995, p. 51), in recent years above all on a firm's capability to respond quickly to environmental changes. Finally, with regard to the simultaneous price (cost) and differentiation advantage the empirical studies show that such a simultaneous advantage seems to result in greater performance than a competitive advantage in just one of the two forms (White, 1986, p. 227; Faulkner, Bowman, 1992, pp. 496-497).

5. CONCLUSION

In the paper we have defined the competitive advantage of a firm as its superior position in an industry or market, where 'superior' refers to the relative comparison with competitors whereas 'position' relates to positional understanding of competitive advantage. The final question remaining to be answered is which basic conditions must be fulfilled in a firm if it wants to build up a competitive position that will result in its long-term superior performance.

Certainly the creation of a competitive advantage requires the existence of certain sources of competitive advantage. As these sources have already been discussed elsewhere (see, e.g., Čater, 2001, pp. 64-74) we do not discuss them in detail here. Let us only mention that basically there are two broad groups of sources of competitive advantage, internal and external. The internal sources are usually divided into tangible and intangible, and employee-related and firm-related. They typically include firm-specific types of resources, capabilities and knowledge. On the other hand, the external sources represent the favorable characteristics of a firm's environment and can be divided into industry-related ones and national-economy-related ones.

In order to be able to say that a firm has a competitive advantage this advantage needs to be correctly perceived by a firm's customers (Ulrich, Lake, 1990, pp. 33-34). A competitive advantage can therefore only be achieved if a firm's customers truly believe that the firm can offer them greater value (benefit per unit of costs) than the competitors. In fact, a firm's product/service could be much better than the products/services offered by its competitors but so long as the customers do not perceive this the firm cannot have a competitive advantage.

We also have to emphasize that a competitive advantage, once achieved, is not something permanent and unchangeable. On the contrary, as soon as a firm forgets that a competitive advantage requires continuous maintenance and investment the competitive advantage could quickly be lost. A firm must therefore continuously seek and develop new sources of competitive advantage (Makovec-Brenčič, 1997, p. 42) and try to keep its offer as unique as possible in comparison with its competitors (Ulrich, Lake, 1990, p. 35).

Another much desired attribute of competitive advantage is its sustainability and durability. Some authors (see, e.g., Powell, 1993, p. 141) even believe that the sustainability (durability) of competitive advantage is a necessary prerequisite for any discussion of true competitive advantage. Very strictly this can be understood whereby a competitive advantage that is not sustainable and/or durable over a longer period of time is not a true competitive advantage. On the other hand, there are other authors who specifically emphasize the use of formulations like sustainable (maintainable, durable etc.) competitive advantage (see, e.g., Coyne, 1986, p. 57; Ghemawat, 1986, pp. 53-54; Williams, 1992, p. 32; Black, Boal, 1994, pp. 131-133). In this way, these authors indicate that they differentiate between competitive advantages that are sustainable in the long term and competitive advantages that are more likely to be neutralized by the competitors relatively soon (Beard, Easingwood, 1992, p. 7).

In this paper we understand competitive advantage as something that can also potentially be a short-term phenomenon. This may be the case if an advantageous cost (price) and/or differentiation position simply cannot be protected against imitation. Of course, such a short-term competitive advantage cannot have a significant positive effect on a firm's performance (Porter, 1996, p. 62), which means that a firm probably should not spend too much effort and money on its development. Therefore, when discussing a firm's competitive advantage we

should not too rigorously look at competitive advantage as something explicitly long-term or even completely durable. This would also not make much sense given that in the contemporary turbulent business environment firms must always upgrade their competitive advantages. In conclusion, the sustainability (maintainability, durability etc.) of a competitive advantage is a desired, albeit not a strictly necessary, condition in competitive-advantage-related discussions.

We fish to conclude our discussion by once again reminding the reader that the process of ensuring a firm's competitiveness always has been, is, and always will be the nucleus of the work of top managers. Even the shifts from the 'hard capitalist' to a more 'social-responsibility-based' management practice cannot change this. For this reason the discussion on a firm's competitive advantage must go on even in the modern business environments. Our goal in this paper was therefore to make a small contribution towards a more unified theory of competitive advantage of a firm. Above all, we wanted to contribute to a clearer understanding (as well as to stimulate further discussion) of the competitive advantage and related concepts. Although our paper is theoretical in nature its strengths can be found in several logical and empirical argumentations as well as in detailed literature review on this wide scientific field.

Key words: *ESOP, Croatian companies, Accounting,
Employee benefits*

1. INTRODUCTION

Stock allocation to the employees is every day even more frequent appearance worldwide and in Croatia, too. Operating instruments for above mentioned are ESOP programs, which present a form of employee ownership and are likely to be established through privatization legal framework in Croatia. Aims of employee stock allocation are multiple, and some of the most important are: increment of employee benefits, but at the same time liquid funds are hold within the company which represent financing and expansion source. On the other hand, employees, as stockholders, are interested in profit growth, because in that situation their ownership interests are satisfied, and undoubtedly efficiency of the company is increased. All above mentioned had and still has influence on development of accounting models for described transactions. As a result of this effort, parts of accounting profession framework are: International Financial Reporting Standard 2 – Share-based Payment, and International Accounting Standard 19 – Employee Benefits.

The main hypothesis of this paper is that ESOP programs, as a way of employee motivation, are introduced in increasing number of companies in Croatia, which requires adequate presentation of these transactions in financial statements, but is still not elaborate enough in accounting literature.

Presentation of these transactions in financial reports of Croatian companies should be in accordance with financial reporting framework which is defined by Accounting Act which regulate appliance with International Financial Reporting Standards for large entrepreneurs, as well as for the companies listed on the stock exchange. At the same time, other entrepreneurs can apply these standards or standards set by the Financial Reporting Board. In other words, financial reporting framework in Croatia is in accordance with the financial reporting framework in the European Union.

2. ESOP DEFINITION, DEVELOPMENT AND FEATURES

2.1. ESOP definition

An Employee Stock Ownership Plan (here and after ESOP) is a form of a defined contribution benefit plan. The company sponsoring the plan makes contributions of cash or shares of its stock directly to an ESOP trust set up for the benefit of the company's employees. If the contribution is in the form of cash, the trust uses the cash to purchase shares of the sponsoring company's stock, often from a large stockholder who wishes to cash-out. Subsequently, the trust distributes the shares to the accounts of a specified employee group. These shares are referred to as "allocated shares." The manner and timing of the allocation depend on how the trust is financed. Employee Stock Ownership Plans (ESOPs) are becoming increasingly diverse and complicated. ESOP work can be shown in few steps[1]:

1. Company establishes an ESOP Trust

2. ESOP Trust purchases company stock from shareholders

3. Bank provides financing to Company: Company re-loans proceeds to ESOP

4. Company pays contribution or dividends to ESOP that ESOP uses to repay debt

5. Company or ESOP repurchases shares from employees after termination.

ESOPs are designed to facilitate employee shareholdings and are often used as vehicles for distributing shares to employees under remuneration schemes. The detailed structures of individual ESOPs are many and varied, as are the reasons for establishing them. However, the main features are often as follows[2]:

1. The ESOP trust provides a warehouse for the sponsoring company's shares, for example by acquiring and holding shares that are to be sold or transferred to employees in the future. The trustees may purchase the shares with finance provided by the sponsoring company (by way of cash contributions or loans), or by a third-party bank loan, or by a combination of the two. Loans from the company are usually interest-free. In other cases, the ESOP trust may subscribe directly for shares issued by the sponsoring company or acquire shares held as treasury shares.

---

[1] Introduction to ESOPs Presentation, www.sesadvisors.com, October 2006
2 UITF abstract 38 Accounting for ESOP trusts (Issued 15 December 2003), page 1-2, www.frc.org.uk/asb/uitf/pub0329.html, December 2006

2. Where the ESOP trust borrows from a third party, the sponsoring company will usually guarantee the loan, i.e. it will be responsible for any shortfall if the trust's assets are insufficient to meet its debt repayment obligations. The company will also generally make regular contributions to the trust to enable the trust to meet its interest payments, i.e. to make good any shortfall between the dividend income of the trust (if any) and the interest payable. As part of this arrangement the trustees usually waive their right to dividends on the shares held by the trust.

3. Shares held by the ESOP trust are distributed to employees through an employee share scheme. There are many different arrangements—these include: the purchase of shares by employees when exercising their share options under a share option scheme; the purchase of shares by the trustees of an approved profit-sharing scheme for allocation to employees under the rules of the scheme; or the transfer of shares to employees under some other incentive scheme.

4. Although the trustees of the ESOP trust must act at all times in accordance with the interests of the beneficiaries under the trust, most ESOP trusts (particularly those established as a means of remunerating employees) are specifically designed so as to serve the purposes of the sponsoring company, and to ensure that there will be minimal risk of any conflict arising between the duties of the trustees and the interest of the company. Where this is so, the sponsoring company has de facto control and there will be nothing to encumber implementation of its wishes in practice.

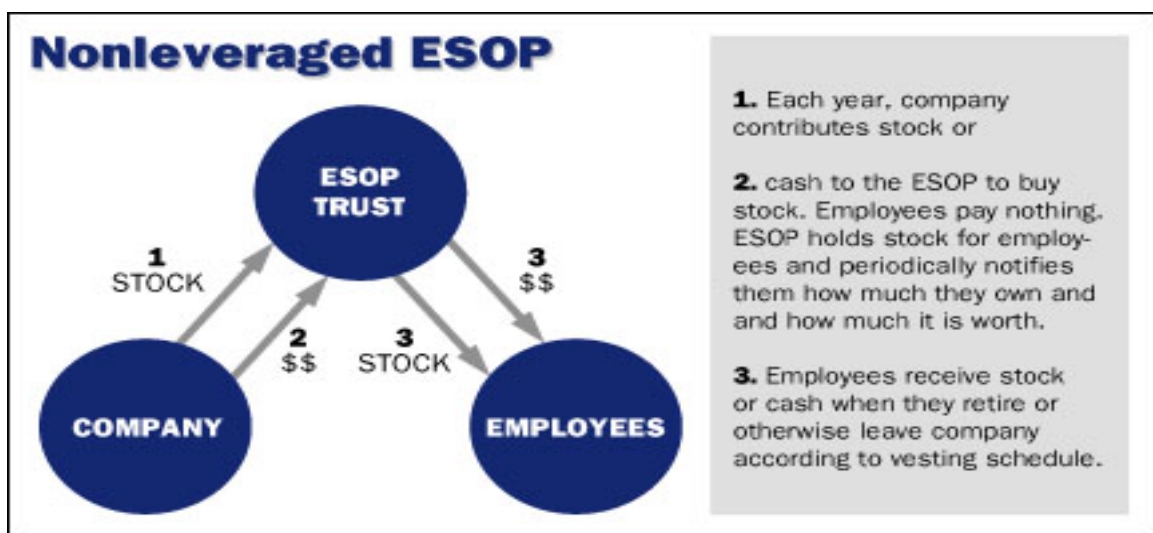
ESOPs may be leveraged or nonleveraged. Nonleveraged plans are the simplest. The company just transfers stock or cash to the ESOP trust. The amount of the contribution is normally determined on the basis of some predetermined criteria, such as a percentage of earnings. After the contribution is made, the ESOP distributes the shares to the individual employee accounts. This setup involves no special financing arrangements.


Figure 1. Nonleveraged ESOP[3]

If the company establishes a leveraged plan, the ESOP trust borrows the cash necessary to purchase the securities. The trust invariably pledges the stock as collateral and the company

---

[3] www.esopassociation.org/about/about_leveraged.asp, December 2006.

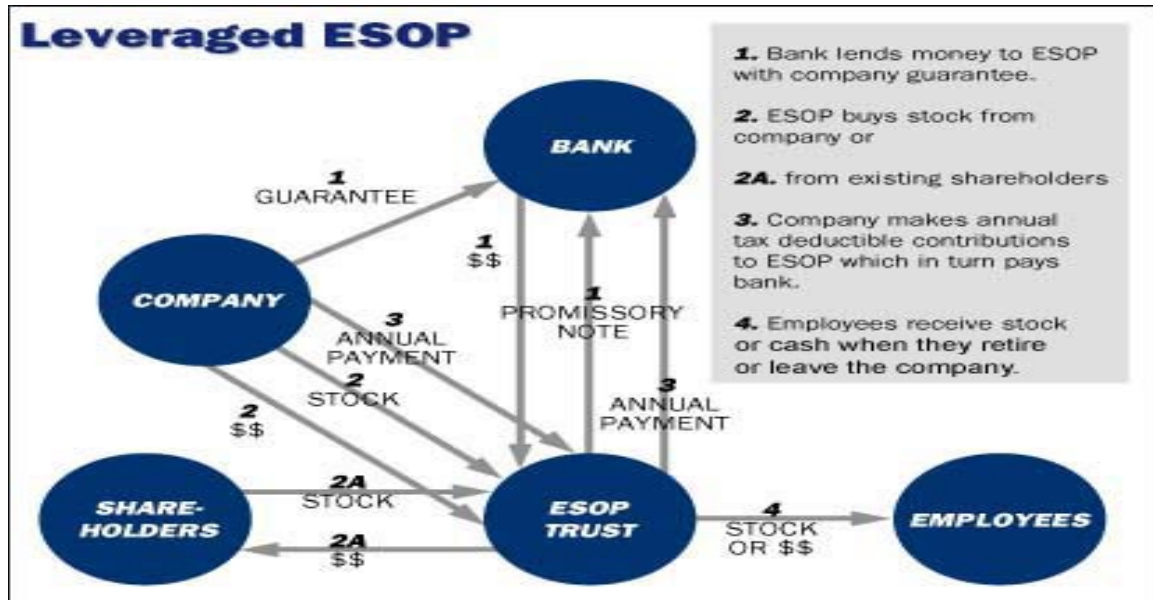
offers some degree of guarantee regarding the loan. The pledged shares are known as "suspense" shares. Cash to repay the loan comes from two sources: dividends received by the trust on suspense shares and cash contributions by the company. Various arrangements are made regarding the cash contribution by the company. The contributions may be a level amount each year or they may be variable. In the latter case, the contribution is dependent on some specified performance measurement basis such as reported profits or operating cash flow.


Figure 2. Leveraged ESOP[4]

The debt service payments cause the release of shares from collateral. Companies use two formulas to determine the number of shares to release. The first, called the principal and interest method, releases shares based on the ratio of the current year's debt payment to the total payments required over the life of the loan. The second method, referred to as the "principal only" method, uses the ratio of the current year's principal payment to the total principal as the basis for releasing shares. Because a larger portion of early debt payments goes toward interest, this method causes a slower rate of release. The trust must allocate the released shares to the employee accounts within a year of release. A nondiscriminatory formula specifies the allocation to individual accounts. Typically, the formula uses the wages and years of service of the individual employees to make the allocation.

When a company's stock has a ready market, the shares allocated to the employee's account are issued when the employee leaves the firm. If the company's shares do not have a ready market, the company must stand ready to repurchase the shares at their fair market value. In this case, the company has issued a "put option" to the employee; i.e., it has agreed to purchase the stock at a later time at a price yet to be determined. Determining this price can be difficult and expensive and is subject to strict regulation. Indeed, this provision is one of the main deterrents to the creation of ESOPs by smaller, closely held companies.

---

[4] www.esopassociation.org/about/about_leveraged.asp, December 2006.

2.2. ESOP features

The increased interest in ESOPs is founded on several attractive features. Favorable tax treatment given ESOP lenders in certain circumstances has allowed ESOPs, and their sponsors through the ESOP, to borrow at reduced interest rates. Other provisions in the tax law allow a deduction for dividends paid on ESOP shares, which has been a particularly attractive feature to public companies. Also, there is deferring of tax that employees pay on stock allocated to their ESOP accounts until they receive distributions; at that point, they are taxed on the distributions.[5] Many employers believe that employee productivity may be enhanced by giving employees a share in the company ownership. Others in the corporate community believe that unfriendly takeovers may be thwarted when a large share of the company ownership is in the hands of employees. Several companies have used ESOPs to finance leveraged buyout (LBO) transactions. Some economists believe that ESOPs are a viable vehicle for transferring ownership of state-owned businesses in Eastern Europe to private hands.

3. ESOP ACCOUNTING DEVELOPMENT

3.1. ESOP accounting in world

The employee stock ownership plan (ESOP) concept was developed in the 1950s by lawyer and investment banker Louis Kelso. However, few companies took up Kelso's ideas because an ESOP's authority to borrow money to buy stock for participants was based on IRS rulings and had no clear statutory authorization.

In 1973, Kelso convinced Senator Russell Long, chairman of the tax-writing Senate Finance Committee, that tax benefits for ESOPs should be permitted and encouraged under employee benefit law. Soon, federal legislation promoting ESOPs appeared, most importantly the Employee Retirement Income Security Act of 1974 (ERISA)[6], which governs employee benefit plans and established a statutory framework for ESOPs.

Until recently, however, ESOP structures were relatively simple, typically involving only common stock of the employer and often leveraged with mortgage-type (level payment) debt with terms of 10 years or less. As the popularity of ESOPs increased in the late 1980s, the nature of ESOP arrangements became more complex. The increased complexity generated differing interpretations of the accounting literature, which was written in simpler times.

---

[5] ESOP Tax Incentives and Contribution Limits , www.nceo.org/library/esop_tax_law.html , December 2006

[6] The Employee Retirement Income Security Act of 1974 (Pub.L. 93-406, 88 Stat. 829, September 2, 1974), commonly known as ERISA, is a United States federal statute which sets minimum standards for pension plans in private industry and provides for extensive rules on Federal income tax effects of dealings in connection with various employee benefit plans. ERISA was enacted to protect interstate commerce and the interests of participants in employee benefit plans and their beneficiaries, by requiring the disclosure and reporting to participants and beneficiaries of financial and other information with respect thereto, by establishing standards of conduct, responsibility, and obligation for fiduciaries of employee benefit plans, and by providing for appropriate remedies, sanctions, and ready access to the Federal courts.

In 1976, the AICPA issued *Statement of Position (SOP) 76-3, Accounting Practices for Certain Employee Stock Ownership Plans*; to address certain accounting issues relating to leveraged ESOPS. The primary recommendations of the SOP are[7]:

1. An obligation of an ESOP should be recognized as a liability by the sponsoring company when the sponsor guarantees the obligation or commits to make future contributions sufficient to service the ESOP debt. This liability is offset by a corresponding reduction in equity; both the liability and the offsetting debit to equity are reduced as the ESOP debt is paid.
2. Contributions or commitments to make contributions to the ESOP are recognized as compensation expense and interest expense by the sponsor.

3. All of the sponsor's shares held by the ESOP are treated as outstanding in the sponsor's calculation of EPS, regardless of whether those shares have been allocated to participants' accounts.

4. Dividends paid on shares held by the ESOP are charged directly to retained earnings by the sponsor.

The ESOP structure has evolved since 1976. Sponsors now are issuing equity, securities to ESOPs with complex conversion, redemption, and dividend features and are financing ESOPs with other than mortgage-type debt. Some of these features were not anticipated in the SOP. For example, in a leveraged ESOP arrangement: the sponsor max, issue convertible preferred stock to the ESOP and use dividends to service the ESOP's debt, reducing the sponsor's required contributions; the ESOP loan may provide for variable payments rather than level payments; the sponsor may not guarantee the ESOP debt; the terms of convertible preferred stock issued to an ESOP may be structured to avoid classification as a common stock equivalent for purposes of EPS calculations; the plan man, provide ESOP participants with a guaranteed value for the convertible preferred stock upon their retirement or termination.

These arrangements raise a number of accounting issues, many of which have been addressed by the EITF.[8] Three controversial issues addressed by the EITF in 1989 are: expense recognition for leveraged ESOPs, treatment of ESOP debt by the sponsor, and ESOP issues affecting the calculation of EPS.

The AICPA changed the accounting for ESOPs by issuing Statement of Position 93-6[9], *Employers' Accounting for Employee Stock Ownership Plans,* in 1993 which supersedes previous SOP 76-3[10].

---

[7] Wise, Bret W; ESOP accounting: past, present and future. *(Employee stock ownership plans); The CPA Journal, June 1990*

[8] Emerging Issues Task Force – EITF is an organization formed in 1984 by the Financial Accounting Standards Board-FASB to provide assistance with timely financial reporting. The EITF holds public meetings in order to identify and resolve accounting issues occurring in the financial world.
[9] Statement of Position 93-6 supersedes AICPA SOP 76-3, Accounting Practices for Certain Employee Stock Ownership Plans. The newer SOP examines significant changes in the way employers report transactions with leveraged Employee Stock Option Plans (ESOPs) and provides essential guidance on accounting for non-leveraged ESOPs. This SOP also addresses issues concerning pension reversion ESOPs, ESOPs that hold convertible preferred stock, and terminations, as well as issues related to accounting for income taxes. Plus, it contains disclosure requirements for all employers with ESOPs, including those that account for ESOP shares under the grandfathering provisions

Previously, a company charged the amount of an ESOP contribution to expense without regard to whether it used the contribution to pay down an exempt loan to release shares. SOP 93-6, however, generally provides that when a company allocates shares to participants' ESOP accounts, a compensation expense results that is measured by the fair market value of the stock on the allocation date.

Under SOP 93-6, a company treats dividends on stock held in an ESOP the same as dividends on non-ESOP shares if the stock is allocated to participant accounts, reducing retained earnings. If the dividends are paid on unallocated shares, the company treats them as

- A reduction of the principal or interest on the exempt loan if it uses them to repay the exempt loan.

- Compensation expense if the company allocates the dividends to participants' accounts or if it pays them to participants out of a suspense account.

Previously, under SOP 76-3, *Accounting Practices for Certain Employee Stock Ownership Plans,* a company treated dividends paid on ESOP shares the same as those paid on non-ESOP shares.

There is another significant difference between SOP 93-6 and the prior rule. Under SOP 76-3, a company considered all ESOP shares outstanding when calculating earnings per share. Under SOP 93-6, the company treats only allocated shares, or shares committed to be allocated (released from the suspense account but not yet allocated within the plan year), as outstanding for this purpose.

There are now about 11,000 ESOPs and similar plans (stock bonus plans) covering over 10 million employees, which represents 10% of the American workforce. ESOPs are found in publicly traded and closely held companies of every size; however, most such companies have over 15 or so employees due to the costs of setting up and administering an ESOP[11]. About 1,000 ESOPs are in publicly traded companies that employ more than 50% of the nation's employee–owners. In 1994 U.S. ESOPs owned $222 billion in corporate assets[12].

3.2. International Financial Reporting Standard 2

The International Financial Reporting Standard (IFRS) 2 "*Share based payments*" contains detailed treatment of cancellations, reprising and other modifications of share-based payment arrangements, on reload facilities, on share-based payment transactions that have a choice of settlement options (i.e. either by issuing equity or by accepting a liability), and on the disclosures to be provided. It also contains some material on how to value shares and options in the absence of observable market prices, although it is unlikely to prescribe the use of any particular valuation model.

[10] David W. Powell, Thomas D. Terry, Ian Lanoff; Reinvigorating aging ESOPs - employee stock ownership plans; Journal of Accountancy, March, 2000
[11] www.nceo.org/library/history.html, , December 2006
[12] David W. Powell, Thomas D. Terry, Ian Lanoff; Reinvigorating aging ESOPs - employee stock ownership plans; Journal of Accountancy, March, 2000

Stated objective of IFRS 2 is "to specify the financial reporting by an entity when it undertakes a share-based payment transaction. In particular, it requires an entity to reflect in its profit and loss and financial position the effects of share-based transactions, including expenses associated with transactions in which share options are granted to employees"[13].

Transactions with employees are measured at fair value of the equity instrument awarded at the date when it is generally granted (i.e. grant date model). Transactions with employees are recognized using a service date model. Grant date is determined as "the date at which the entity and another party (including employee) agree to share-based payment arrangement, being when the entity and the counterparty have a shared understanding of the terms and conditions of the arrangement[14]". As discussed above, equity-settled transactions must be measured at fair value of the equity instruments issued to employees, except where is impossible to determine fair value. Fair value should be based on market prices if available. In the absence of market prices, a valuation technique should be used to estimate what the market price would have been on the grant date in an arm's-length transaction between informed and willing parties. In such cases, the entity is required to adopt a method of accounting based on the intrinsic value of the award (the price of the underlying share less the exercise price).

3.3. Allocation of expense

This question raises the issue of weather a share-based payment transaction should be recognized:

1. when the relevant equity instrument is first granted

2. when it vests

3. during the vesting period

4. during the life of the option

When the award of equity instruments vests immediately, IFRS 2 creates presumption that the award is in the respect of the service that has already been rendered, and should be therefore expensed in full at the grant date.

Where equity instruments are granted subject to vesting condition, IFRS 2 creates presumption that they are a payment for the service to be received in the future, during the vesting period, with the transaction being recognized during that period. The overall objective is that, at the end of the vesting period, the cumulative charge to the income statement should represent the number of equity instruments that have actually vested multiplied by their fair value, excluding the effect of the vesting conditions, at the date of grant.

---

[13] IFRS 2, Share-based Payment, IASB, February 2004, paragraph 1.
[14] International GAAP 2005, LexisNexis, 2004, page 1603

According to IFRS 2 share based transactions can be equity settled or cash settled. If the share based transactions are equity settled than the basic accounting entry is:

> **DR Profit or loss for the period (Employee cost)**
> **CR Equity**

If the share-based transactions are equity settled than the basic accounting entry is:

> **DR Profit or loss for the period (Employee cost)**
> **CR Liability**

4. ESOP IN CROATIA

4.1. Croatian companies and ESOP

Croatian privatization model did not stimulate ESOP programs so they developed in Croatia relatively late. The purpose was to overcome difficulties which have been caused by main privatization model. Furthermore, there are no tax relieves or any other mechanism, at the state level, which would encourage expansion of ESOPs[15].

Today in Croatia there are 100 different ESOP programs. For example, ESOP was implemented in Zagrebačka banka, Pliva, Dalekokvod etc.

It is important to state that there is no special accounting regulation in Croatia for ESOP. Croatian companies are obliged to use International Financial Reporting Standards for composing their financial statements. Therefore, we can say that the only existing accounting regulation for ESOP in Croatia is IFRS 2 and indirectly IAS 26 "*Accounting and Reporting by Retirement Benefit Plans*".

4.2. New privatization law

In the state portfolio there are approximately 850 companies ready for privatization, from which 700 are not insolvent. One hundred of these companies are in 50% state ownership and in 160 companies state has 25%-50% of shares. These percentages do not include daughter companies like of Hrvatske željeznice or Hrvatske šume, so the percentages are even higher.

According to new proposal of the Privatization Law in Croatia, employees would be entitled to privilege purchase up to 25% of company's shares with 25% of discount. It has been discussed that employees would be able, without company's approval, to found ESOP trust. Furthermore, the article according to which ESOP trust must have equity in the equal amount of shares intended to be purchase by employees has been canceled. Ownership and control would be transferred to employees after the first installment is paid to the Croatian privatization fund.

The price of shares could be determined according to average share price in last three months if they are not listed on the stock exchange, or the share price could be determined by qualified valuer.

---

[15] D. Tipurić: ESOP i hrvatsko poduzeće, Sinergija, 2004, page 15

The Government has promised its engagement in negotiations with banks regarding loans for purchase of shares according to ESOP.

As it was already stated, in Croatia there isn't any tax relieves for ESOP and it is very important for Government to consider some relieves in order to change this situation. That is important because it can be motivating for other companies, already privatized, to think about this possibility. If there are any relieves for company and/or employee when they have ESOP they will consider its implementation, but if there are no relieves, than the question is, why doing such complex step.

Furthermore, Croatian model of ESOP has greater similarity to *Employee Stock Option Plan*. According to U.S. Securities and Exchange Commission Employee Stock Options Plans should not be confused with the term "ESOPs," or Employee Stock Ownership Plans, which are retirement plans. Many companies use employee stock options plans to compensate, retain, and attract employees. These plans are contracts between a company and its employees that give employees the right to buy a specific number of the company's shares at a fixed price within a certain period of time. Employees who are granted stock options hope to profit by exercising their options at a higher price than when they were granted[16]. In other words, employees have the opportunity to buy companies stock during specific period by predetermined price.

5. CONCLUSION

With this paper we have confirmed that ESOP will be introduced in greater number of Croatian companies through new Privatization Law. We have concluded that ESOP introduced in Croatia trough new Privatization Law has more resemblance to employee stock **option** plans than original employee stock **ownership** plan. ESOP has rapidly developed in world due to existence of tax relieves. Furthermore, in the absence of tax relieves concerning ESOP, already private companies, do not see any benefits from introducing the ESOP in their business, so the absence of tax relieves has impact on ESOP development in Croatia.

When it is being discussed about accounting regulation, we have proved that only existing accounting regulation in Croatia is International Financial Reporting Standard 2. Mentioned standard covers all share-based payment (to employees and non employees). It gives accounting basis for the share-based payments. Nevertheless, IFRS 2 does not give instructions how to account for ESOP phenomenon.

From the above stated we can conclude that it is necessary to develop accounting and tax regulations that would provide basis for development of ESOP and financial reporting frame for ESOP.

Key words: *Stakeholders, Management of stakeholders*

1. INTRODUCTION

Strengthening the competitive potential of a company is nowadays one of the most discussed issues of a company practice. Dynamics of surroundings development, growth of competition, internationalization of the surroundings, in which the company operates – all this poses high demands on the company management. Company management and maintaining company long-term stability in difficult, imperfectly competitive and constantly changing conditions has been more and more demanding. There are many new factors able to influence and continuously disturb the company stability. One of these factors is the existence of groups both within and around the company, which, by pursuing own interests, can to a certain extent influence the company behavior both in the short-term and long-term. The objective of company management is thus to maintain the balance between the company and its surroundings, also from the viewpoint of company stakeholders.

Management of relationships between a company and its stakeholders is an important task for the company management. The identification of strategically important stakeholders of the company, interception of their requirements and expectations and evaluation of their influence should become a part of company strategy, regardless of a size and legal form of the company.

1.1. Company Stakeholders: Theoretical Basis

The notion "interest groups" (stakeholders), referring to company practice, started to emerge in the 1960's as a consequence of dynamical development of the whole society. The actual concept of the existence of "interest groups" is historically much older. Its basis is laid when people in society are determined as money holders or owners of other forms of possession. The fundamental aim of the theory of "interest groups" in connection with company existence has been to create a widely accepted bases acknowledged by the company practice.

Originally, interest groups within a company were considered to be holders of shares and partners, later in literature referred to as "stockholders" and "shareholders" - stockholders in the sense of a person holding shares (securities) and shareholders as partners (co-owners). Nowadays, the term "stakeholders" has been commonly used in the sense of a broader concept of company interest groups also for those groups, which have a kind of "stake" in the

company. Many renowned economists have been looking into the contextual meaning and creating a definition of company stakeholders. Already in 1965 Cohen and Cyret suggested that a company is a kind of coalition formed by individuals and groups with their own goals. They see company existence as a result of agreement among managers, employees, shareholders, customers and others having a stake in the company and may influence the company objectives in different extents. Further development in the given field is credited to Freeman in his work from the year 1984 – "Strategic Management: A Stakeholder Approach". He understands interest groups to be such groups or individuals, who either may influence or may be influenced by the company objectives. Clarkson, in 1994, implies a broader concept to define interest groups within a company. In his definition, interest groups are individuals or groups, which are voluntarily or involuntarily exposed to the risk linked to company activities. In 1995, Bowman made out another definition, where interest groups are considered to be individuals or groups, which have an economic interest in the company and are also the source of its success. According to Bowman, the task of the company management is to balance different interests of individual stakeholders with the ultimate company behavior (Dohnalová, 2004).

Even though a unified definition of company stakeholders has not yet been created, if we conclude all the above mentioned findings of the renowned economists, we can then formulate a widely accepted definition of the company interest groups: they are individuals of groups either influencing or being influenced by the company activities or are voluntarily or involuntarily exposed to the risks emerging from the company activities (Dohnalová, 2004).

Who actually are company stakeholders, then? According to the previously mentioned definition, they are all subjects and groups existing in the company inner or outer environment. It is typical for them to be influenced by the company activities and decisions and at the same time the stakeholders influence the company. If we apply the broader approach to the problems of company stakeholders, then the most common groups somehow linked to the company are: owners: shareholders, investors and company creditors; managers; employees; customers; suppliers; social and political groups.

What kind of stakeholders should a company deal with? Company stakeholders can be divided into two groups: internal and external. If we consider the specification of company inner environment, then such subjects and groups which operate with their own strength inside the company will be regarded as internal stakeholders. These are mainly:

- company owners: shareholders, investors and creditors;
- company managers,
- other employees (excluding managers).

Generally speaking, using the definition of company outer environment, as external groups may be considered those, whose functioning can potentially influence the company efficiency. These could be:

- suppliers,
- customers,
- social and political groups.

From the viewpoint of the listing of stakeholders, these are the groups of stakeholders which are currently the most widely accepted both in the academic world and practical management.

In the real world, other groups may be defined, which meet the criteria of the definition of stakeholders and are able to, in the short or long-term, influence company activities.

2. THE PROCESS OF RELATIONS MANAGEMENT OF COMPANY WITH STAKEHOLDERS

Generally it can be said that relations management of a company with stakeholders is of process character. Using suitable tools, strategically important stakeholders inside a company are revealed and identified, together with their aims and demands. Subsequently, the corresponding means are chosen for their analysis and management from the company's side. The aim of the whole process is to create positive relations to them and use them as a potential source of the company's success, to eliminate the occurrence of negative relations that might interfere with the company's economic activities. In principle, the process of relations management of the company with stakeholders can be specified by means of sub-steps which link to each other, as shown in the Figure 1 below.

1. **Identification of the company's stakeholders**
   - Who they are

2. **Analysis of the company's stakeholders**
   - Their influence upon the company
   - Revealing of their aims and demands
   - Time aspect of their existence

3. **Selection of strategy**
   - Possibilities of action upon stakeholders
   - Means of action
   - Tools of action

4. **Realization of action strategy**
   - Utilization of the selected means and tools in practice

5. **Evaluation**
   - Evaluation and formulation of conclusions and recommendations

Figure 1 Process of relations Management of Company with Stakeholders

Identification of a company's stakeholder means practical application of features characterising these groups. If we conclude all the above mentioned findings of the renowned economists, we can then formulate the basic elements of the company interest groups definition. These elements can also be perceived characteristic signs for the identification side:

- individuals or groups operating both inside and in the company surroundings, with different requirements and expectations;

- having influence on the ultimate company behavior;

- having a stake in the company;

- earnings (voluntarily or involuntarily) the risk linked to company activities.

Analysis of a stakeholder concentrates in principle on obtaining information from several spheres of its action upon the company. First, specification of its influence and role in relation to the company. From the point of view of estimating the stakeholder´s role, its relation to the decision-making processes can be observed, namely if it is a part of the decision-making processes or if it influences them in a certain way. Influence of the stakeholder upon the company can be direct and indirect. Direct influence means that the stakeholder is a source for the creation of the company's performance, and thus directly influences the aim or aims of the company. Indirect influence means that the stakeholder is not a source for the company's performance, but it can have an influence upon the company's sources and thus also upon the aim or aims of the company. Second, as a part of the analysis, time aspect has to be considered, or otherwise said the length of the stakeholder´s existence. The specified stakeholder can operate in the company for a long time, then the observance of its aims and demands is a part of the company's long-term strategy. However, there can also be groups which are formed only for a short time in the company. Having fulfilled their interest they disappear.

The selection of the strategy should include selection of means and tools for relations management with stakeholders as a task of the top management, and also competences and responsibilities should be specified.

Realisation of the selected means and tools is a step in which an important role is played by the middle management. From the point of view of its position it works as a mediator and a collector, and also a supplier of substantial information obtained from the stakeholders existing not only inside but also outside the company.

Evaluation. The last step in the process is, on the basis of the data obtained to evaluate the ways of implementation of the used means and tools and to formulate conclusions for the existing and future decision-making processes of the company, both for the sphere of relations management of the company and for the sphere of the target behaviour of the company.

3. OBJECTIVES OF STAKEHOLDERS: RESEARCH IN CZECH COMPANIES

An important task for the development of definition of stakeholders and its implementation into practice is to outline quantities, which would characterize objectives of strategically important company stakeholders. The concept of the theory of stakeholders with respect to company practice would thus become much more real and tangible. However, the selection of suitable parameters characterizing the aims of company stakeholders is a difficult task, which requires close cooperation of theory-makers with representatives of practice.

3.1. Research Methodology

In 2005, a research among Czech companies was carried out focusing on the conception of problems of stakeholders in Czech practice. Apart from opinion viewpoints on company stakeholders, the research was aimed to evaluate the chosen parameters characterizing possible objectives of selected company stakeholders. Basically, two fundamental aims of the research may be defined:

A1: Determine the opinion viewpoint on company stakeholders in Czech companies.

A2: Qualitative and quantitative view of practice on the parameters characterizing objectives of company stakeholders.

The research was carried out applying the methods of questionnaire survey. Out of the total of 150 questionnaires, 106 were used for further analysis. The empirical data were then processed using simple methods of statistical analysis such as arithmetic or weighted mean. In the following text only summary results shall be presented. Exclusion of partial steps of data processing should not affect the overall evidential ability.

Findings from company microeconomic theories were applied when determining parameters characterizing objectives of the groups of stakeholders. Parameters for the investigated groups of company stakeholders were set based on a detailed analysis of company neoclassical theory and company alternative theories. The questionnaire survey determined whether the parameters correspond with the practical needs. The qualitative evaluation was carried out by the method of marking. The respondents' task was to mark the parameters in the stakeholder's group according to its importance. Average marks of parameters were set when processing the data gained by calculation, i.e. by the methods of weighted mead following the formula:

$$\overline{x} = \frac{\sum_{i=1}^{k} x_i * n_i}{\sum_{i=1}^{k} n_i}$$

The frequencies n_1, $n_2, ..., n_k$ imply weight, i.e. importance attributed to individual variations of the symbol x_1, x_2, ..., x_k. When calculating the average marks, the symbols represent the marks rated by the respondents for individual objectives of the given interest group. Statistical file is divided into sub-files with respect to the legal form of business. Weight is a frequency of occurrence of the given symbol in a sub-file.

3.2. Results of Research

No specific criterion was set to select the respondents. 150 Czech companies were randomly selected and addressed to participate in the questionnaire survey. They were companies with different legal forms of business valid in the Czech Republic. The structure of the respondents from the viewpoint of legal forms can be seen in Table no. 1. These are forms of businesses set by the legislation of the Czech Republic, i.e. natural person (hereafter referred to as "NP"), Co-partnership, Limited Partnership, private limited company (further as "Ltd"), public limited company (Plc), Co-operative and State Enterprise.

Table 1 Number of Respondents from the Viewpoint of Legal Form of Business

Legal Form	Number of Companies (n)	Number of Companies (%)
NP	16	15
Co-partnership	1	1
Limited Partnership	1	1
Ltd	52	49
Plc	32	30
Co-operative	2	2
State Enterprise	2	2
Total	106	100

3.3. Concept of Stakeholders in Czech Companies

To monitor the state of the concept of stakeholders in Czech companies, the following hypothesis was formulated:

H1: Czech companies regard the existence of stakeholders as a real phenomenon, yet they deal with the relationships with them only to a limited extent.

The research findings revealed that 88 per cent of the respondents see the existence of company stakeholders and their influence on companies as a real phenomenon. The remaining 12 per cent did not deal with the given problems. The question whether the company management is familiar with the concept of theory of stakeholders was positively answered by 55 per cent of the respondents.

Based on the findings, it can be concluded that the existence of company stakeholders is perceived as a real phenomenon of today. The problem seems to be the absence of methods for effective implementation of the theory of stakeholders' concept into practice.

3.4. Interests of Groups of Stakeholders According to Czech Companies

To monitor the interests of the selected groups of stakeholders, the following hypothesis was defined:

H2: The interests of groups of company stakeholders may be identified using the parameters individually selected for each stakeholder group.

For the research were chosen those company stakeholders, who directly influence the company efficiency, i.e. owners, managers, employees (excluding managers), suppliers and customers. Generally, those, simply said, expecting some appreciation of capital invested into the company will be referred to as company owners. Ownership and power structure of a company may differ as far as the complexity is concerned. Such a group of stakeholders may be formed by an individual or a group of individuals. The complexity of ownership structure often depends on the legal form as well as company size. Typically, small and middle-sized businesses have a simpler ownership structure, where the owner is one or several persons. With large companies, especially public limited companies, owners as small or majority shareholders often present a numerous group. The common interest of all is ultimately long-term appreciation of the invested capital.

The survey findings concerning possible interests pursued by owners of Czech companies are mentioned in Table 2.

Table 2 Parameters for Interests of Company Owners

Interests of Company Owners	Final Mark	Rank
Maximal Earnings	3,12	2
Minimal Costs	3,40	3
Appreciation of Invested Capital	2,50	1
Preservation of Invested Capital	8,76	6
Financial Independence	3,64	4
Independence in Company Management	4,36	5

A manager is understood as an individual who, through his/her decisions, to a various extent influences the company activities. Subject, extent and character of managerial work differ in levels on which the manager works. This position is affected by other factors such as the company size, character of managerial work etc. Many economic theory-makers see top management as the most important group since it is the bearer of strategic decisions and thus is able to significantly influence long-term existence of the company. Top management also possesses important information. In practice, this managerial level is represented by a group of directors. As for the relation to the company, managers may be employed based on the principle of agency theory, i.e. manager as an agent of a renter, i.e. an owner or owners of the company. For the relationship agent – renter it is typical to delegate decision-making rights. The agent thus makes decisions on behalf of the renter and they mutually share the consequences. The decision-making usually takes place in conditions of uncertainty; therefore, the exact effect of agent's activities cannot be determined. There exists, however, asymmetric information – the agent tends to act in his/her own interest, aiming to maximize his/her own profit.

The survey findings concerning interests of managers in the addressed Czech companies with qualitative evaluation may be found in Table 3.

Table 3 Parameters for Interests of Company Managers and Their Evaluation

Interests of Company Managers	Final Mark	Rank
Extent of Responsibility	2,04	1
Influence on Decision-making	2,43	2
Realization of Own Aims	3,16	3
Pay	3,64	4
Fringe Benefits	5,30	6
Number of Subordinates	6,42	7
Financial Independence	4,36	5

Company staff (excluding managers) is the closest to production processes. It is expected that their relation with the company was created based on free choice and is governed by work contract. Lately, due to the start of information era, there has been a significant qualitative change in the relationship between employees and company. In the past, employees were hired not to think but to perform physical work. Today, routine work has been almost fully automated; computer-controlled production processes replace workers in many production operations. Nowadays, it is the staff that often generates new ideas and is one of the sources of company innovative processes. Pursuing their interests and implementation of the findings into company decision-making processes may significantly influence the company activities.

Parameters regarding the interests of company staff and their qualitative evaluation based on the situation in the Czech Republic are listed in Table 4.

Table 4 Final Marks for Objectives of Company Staff and Their Evaluation

Interests of Company Employees	Final Mark	Rank
Wages	1,24	1
Job Position	3,95	2
Length of Work Contract	3,97	3
Good Working Environment	4,33	4
Application of Achieved Qualification	4,89	7
Good Workplace Interpersonal Relations	4,37	5
Recognition of Work	4,77	6

Suppliers as an external group of company stakeholders possess different forms of inputs necessary to generate company efficiency. Their relations with the company are usually business-like. Their selection is subject to many factors such as a kind of products and services. A group of suppliers is often formed by more subjects. As for companies, suppliers are selected and assessed according to criteria which the company defined, as well as the extent of fulfillment of expectations, which the company hoped to gain from these relationships. A part of the selection process is to assess whether the supplier is able to keep to the contracted terms and meet agreed requirements. For the maintenance of positive relations between the company and suppliers, pursuing suppliers' interests as company stakeholders may have a significant influence on the company performance.

Parameters for interests of company suppliers and their qualitative evaluation resulting from Czech practice are to be found in Table 5.

Table 5 Final Marks for Aims of Company Suppliers and Their Evaluation

Interests of Company Suppliers	Final Mark	Rank
Stable Sales Opportunities	2,82	2
Advantageous Sales Conditions	3,29	3
Advantageous Payment Conditions	3,46	4
Trust and Reliability	2,63	1
Position of Main Supplier	4,24	5
Company Image	4,83	6

Customers represent an external group of company stakeholders. It is known that companies exist to satisfy the needs of their customers. Company customers absorb the company outputs. They are the source of reaching the financial objectives of the company. However, they also symbolize possible uncertainty for the company. Their needs may change in time. The extent of risk resulting from the relationship between customers and company may vary for different firms. Besides effort focusing on satisfying their customers' needs, company management also strives to balance their interests with company objectives. Businesses trying to be everything for everyone usually end up being nothing for nobody. Competitors often take such companies by surprise unless they quickly understand the needs of this group.

Table 6 shows parameters for interests of customers of Czech companies and their qualitative evaluation.

Table 6 Final Marks for Interests of Company Customers and Their Evaluation

Interests of Company Customers	Final Mark	Rank
Good Image of Producer	4,36	5
Guarantee Conditions	4,39	6
Service Conditions	4,32	4
Time of Debt Maturity	4,26	3
Price of Products and Services	1,87	2
Quality of Products and Services	1,81	1

Within the carried-out research, other groups of stakeholders, especially from the company external environment were not investigated. Due to the extensive demandingness these will be subject to further research.

The research findings suggest that the existence of company stakeholders is a real phenomenon also in companies in the Czech Republic. However, the fact is that in most companies the relationships with stakeholders are not dealt with.

The research results mentioned in Table no. 2-6 imply that to discover the interests of stakeholders several parameters can be used to more closely identify and determine their hierarchical organization in the given time.

4. CONCLUSION

Nowadays, economists consider the concept of company stakeholders as compatible with business. Economic reality of company practice shows that groups of company stakeholders may be important sources having the ability to influence the company performance. Value creation for long-term interested owners often runs concurrently with value creation for other interest groups.

The task for economists is to establish basic elements of comprehensive theory of interest groups in companies. Even though such a unified definition has not been created to this day, based on existing approaches it is possible to outline characteristic signs of stakeholders and use them for their identification in company practice. Identification of company stakeholders and interception of their interests is the basis to be able to establish long-term positive relationships between them and companies. These relationships may then become a source of lasting company success and can contribute to the benefit of all parties.

The objective of the development of the interest groups theory and its practical application is not to equalize the relationships of all concerned parties in companies. From the viewpoint of ownership rights this is barely possible. From the viewpoint of social development, however, interests of all concerned parties in companies cannot be ignored.

Key words: *Marketing communication, Commercial sponsorship*
Image, Sport, Brand

1. INTRODUCTION

The integration of sports sponsorship on marketing communication was something that barely existed in Europe at the end of the 1980s. Sports marketing communication was at that time reduced to sports sponsorship in its strictest sense: the placing – in return for money – of logos in those media that traditionally were tied strongly to sports (Lagae, 2005). Consequently, sports sponsorship has increased in popularity and sophistication. According to Kolah (2003), global sponsorship amounted to $26.2 billion in 2003, and Europe represented around one third of this worldwide sponsorship market, with 81% of that market involving sports sponsorship.

Marketing communication has reacted enthusiastically to the growth in scale and professionalism in the sports sector. Due to the proliferation of leisure events in today's society, the awareness and opportunity for commercial event sponsorship is at an all time high. Although attempts at measuring the return on the sponsorship investment have been made (e.g., total event attendance, exit polls, sales following the event, and number of media mentions), an understanding of how sponsorship "works" has yet to be developed (Catherwood and van Kirk, 1992; Javalgi et al., 1994; Meerabeau et al, 1991; Parker, 1991).

Gwinner (1997) proposed a model to explain the mechanisms by which brand image may be impacted through case study sponsorship activities. Specifically, drawing on the theory of meaning transfer from the celebrity endorsement literature, a model is presented which suggests the factors involved in creating an event's image and the subsequent transfer of that image to the sponsoring brand. The aim of this paper is to examine the impact of sport sponsorship on consumer association with sponsors' brands and to explore, within this context, the potential of events as communication vehicles. We also discuss the relations between different communication elements and sport sponsorship, and the effectiveness of sponsorship communications.

WTA Bank Koper Slovenia Open in Portorož is a professional tennis tournament with the prize fund of $145,000, a part of Sony Ericsson WTA tour. Tournament was organized for the second time in the 2006 on the hard court of the Sports Recreational Center Marina Portorož, from September 16th to 24th. Tournaments with similar prize fund there usually attract players

ranked from 20th to 120th place on the Sony WTA tour singles ranking. In the week of September 18th to 24th there are no tournaments in Europe, only in Beijing – China and Calcutta – India. Prize fund must be assured by the official sponsor of the tournament. Beijing offers $585,000 and Calcutta $170,000 of the prize fund. Organizers decided that the prize fund of Portorož is interesting enough to attract important tennis names of the world.

2. LITERATURE REVIEW

In the last decades sport continues to push back the boundaries of our usual understanding of it as something that unites people, calls forth the sport spirit and where financial side is not that important. Sport became extremely competitive, so that the importance of achieving results is sometimes fatal for individuals. Accordingly, the role of capital that supports sport rose sharply. Sponsorship became the main source of assets in sport and an excellent promotional activity for companies that sponsor, especially because more and more people are becoming enthusiastic about sport. In paper we describe a case study about an important sponsorship of WTA tennis tournament Bank Koper Slovenia Open.

After Meenaghan (1991) the definition of sponsorship is:

"Sponsorship is an investment, in cash or in kind, in an activity, person or event (sponsee), in return for access to the exploitable commercial potential associated with that activity, person or event by the investor (sponsor)".

2.1 Sponsorship and communication mix

Sponsorship is a communication mix element where a firm provides some financial support to an entity, which may be an individual (e.g. sports), an organization (e.g. a humane society) or a group (e.g. an orchestra), in order to allow this entity to pursue its activities (e.g. a cultural event) and, at the same time, benefit from this association in terms of global image and consumer awareness of the firm's market offerings (Abratt et al., 1987; Boisvert, 1987). Meenagahan (1991) reports that the practice of sponsorship is quite developed and have become a standard component of the marketing plan.

Surveys conducted among American and European companies have found that sponsorship investments generally pursue two main objectives: increasing consumer awareness and improving corporate image (Armstrong, 1988; Wolton, 1988). A study conducted by Phillips International, resulted in a greater perceived association between the company and the sport event as well as a significant improvement in corporate image (Otker and Hayes, 1987). Anne and Cheron (1991) have studied the impact of sponsorship on consumer awareness. They conclude that recall of the name of the sponsoring company depends on the sponsor's degree of involvement, the amount of prior consumer knowledge about the sponsor and consumer interest in the sponsored activity. In another study, Wright (1988) found that the association between the sponsor and the sponsored entity (and the activity or event) is long lasting, even when the sponsor withdraws.

After Farrelly et al., 2003) in the field of sport sponsorship, a strong market orientation appears to be positively associated with communication, commitment and trust. Hence, those sponsors able to raise their degree of market orientation may expect to derive the benefits

associated with these desirable relationship indicators. However, to raise the level of trust in the relationship will require more than mere communication processes. They suggest that commitment to the sponsorship relationship is positively related to market orientation.

Confusion may exist among the members of target audiences or publics about perceiving sponsorship as advertising even though there are distinctive differences. Although some forms of sponsorship might share similar goals to advertising, i.e. increasing brand or company awareness, and promoting of positive messages about the product or company, it is argued that sponsorship is a means of persuasion which is fundamentally different from traditional advertising (Abratt et al, 1987; Crimmins and Horn, 1996; Hastings, 1984; Wilmshurst, 1993).

The interaction between sponsorship and advertising can be regarded in the heightened marketing communications ambience of the late twentieth century as a strategic rather than uneasy alliance. Likewise, and from the same contextual perspective, the interactions form strategic symbiosis with sponsorship being an indirect, but powerful form of persuasion which potentially can overcome difficulties faced by advertising and other direct forms of persuasion activities, while simultaneously operating in conjunction with advertising and other marketing communications as the strengthening forces overarching the sponsorship communications. Strategic symbiosis is needed in order to get company messages across to consumers in meaningful and cost-effective ways (Erdogan and Kitchen, 1998).

2.2. Sponsorship evaluation

A usual assumption often made in relation to sponsorship is that its effectiveness can be measured in similar ways as advertising. This involves quantifying media overage or exposure of the sponsor, using clippings and column-centimetres in print in duration of exposure in broadcast media, as the unit of measurement (Sparks, 1995). One of shortcomings of this method is that such measures of exposure may or may not translate into a change in consumers' perception and consequently little is usually gained from using them fro performance evaluation purposes.

Another, and sometimes complementary method of evaluation, focuses on the number of impressions made – these are merely another form of opportunity to see measure in which audience characteristics are taken into consideration (Harris, 1993).

There has also been emphasised the importance of measuring sponsorship effects over long term (Armstrong, 1998; Wright, 1988). In particular, Parker (1991) pointed out that while spontaneous awareness of an event and sponsor may be very low initially, long-term effects could be prevalent even years after the sponsorship had ceased, once a meaningful association is developed.

Quester and Farrelly (1998) gathered and defined the factors affecting evaluation:

- emotion, awareness and recall;
- involvement, loyalty.

2.3. Image creation and image transfer

While both advertising and sponsorship can be used to achieve image objectives, sponsorship differs in the manner in which these are achieved. Essentially sponsorship allows the sponsored brand to live in the reflection of the sponsored activity. This reflective approach differs somewhat of more direct approach offered by traditional advertising, and enables sponsors to suggest associations for the brand which advertising can only convey in a more overt and clumsier fashion (Meenaghan and Shipley, 1999).

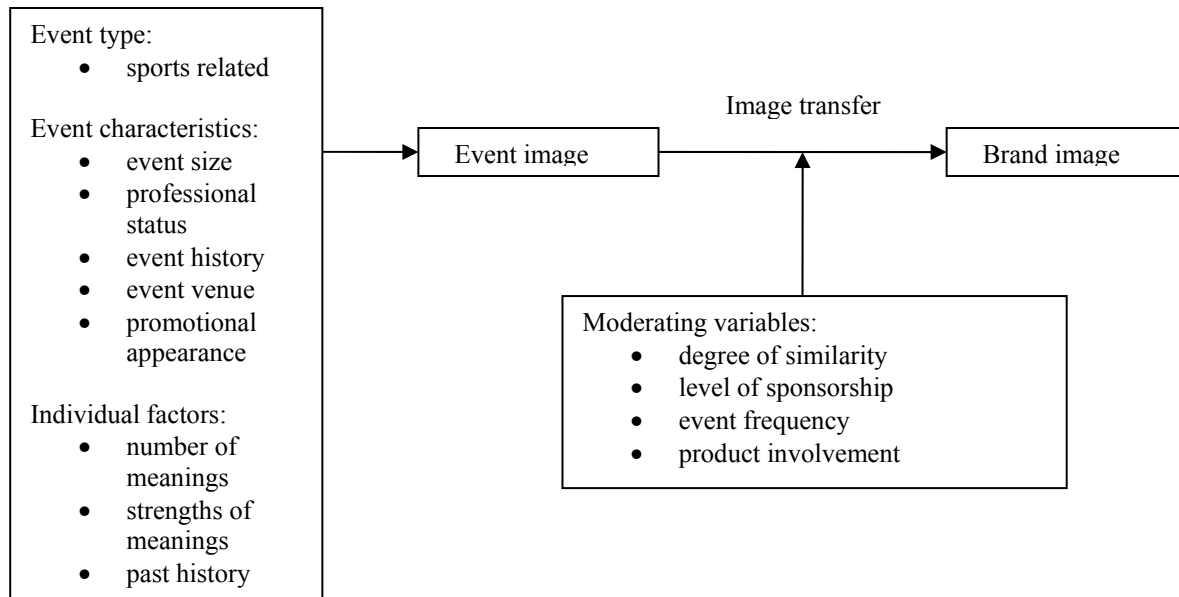
Keller (1993) has suggested that when a brand becomes associated with an event, some of the associations linked with the event (e.g. youthful, relaxing, enjoyable, disappointing, sophisticated, elite, etc.) may become linked in memory with the brand. The framework presented in Figure 1, adapted from Gwinner (1997) evolvement of McCracken's (1989) celebrity endorsement model, suggests the event image is formed from a number of external and internal factors. Through sponsorship, an event's image, which may be relatively distinct for different consumer groups, may be transferred through association to the sponsoring product.


Figure 1:A model of image creation and image transfer in event sponsorship (Source: adapted after Gwinner, 1997).

We are discussing these factors on the case study in the next chapter. Gwinner (1997) implies that a company should consider more than simply the number of potential customers their sponsorship signage and other identifiers will reach. It is important to consider the image of the event, as this image may become associated with the brand.

Given the potentially ambiguous and transitory nature of the event's image, qualitative methods in the form of depth interviews, focus groups, and projective techniques, are likely to provide the best of how consumers perceive/assess a given event. Regarding the sponsoring brand, the model suggests several aspects of sponsorship that should be considered when deciding on potential event affiliations. One aspect that should be considered, in light of image transfer benefits, is the degree of similarity between the event and the brand. Brand awareness benefits are likely to accrue regardless of similarity levels. Companies looking to

add sponsorship activities to their promotional mix should also consider the level of sponsorship and frequency of the event. Exclusive sponsorship in events occurring on a frequent basis will likely maximize the image transfer potential of sponsorship purchase. And finally, the company should consider whether image transfer benefits will actually have any influence on consumers' attitudes towards their brand and ultimately their purchase intention. The model suggests that, in terms of impacting a consumer's attitude towards a brand, low involvement products will be more effective in sponsorship promotions due to the peripheral nature of persuasion taking place (Gwinner, 1997).

3. CASE STUDY OF THE BANK KOPER SLOVENIA OPEN WTA TOURNAMENT

The study was designed as an exploratory study, as Bouma and Atkinson (1995) define it. The purpose of the study was to gain an insight into company's decisions, motivation and benefits of sponsoring certain sport event. We were interested in the sponsors perceptions and practices that are central to the concept of sponsoring. The study was guided by the following research questions:

- How does sponsor understand sponsorship of sport event?
- How does sponsor sees the role of sponsored sport?
- What is the influence of sponsorship activity on the image of sponsor?
- Do consumers associate an event's image with sponsors?
- If there is an image association between event and sponsor; is there a theoretical explanation that can be used to understand this link?

Data were gathered through individual in-depth interviews with marketing director of Bank and with tournament director. The study has some limitations, one of them being the generalization of findings.

Bank of Koper follows three basic motivations when deciding about the sponsorship projects. The strongest motive is certainly the business connection, which can be direct or indirect. Bank tries to help the submissions that come from the working area of bank. So the Bank of Koper funds fireman association, tourist association, ski club, basketball club, handball club, rowing club, tennis club …

Second motive is a communication motive; bank can expand its territorial business area. They sponsor important events in country that attract bigger media attention. Bank increases its recognisability and its image, when sponsoring: summer festival Lent Maribor; Theater gathering Borštnikovo srečanje in Ljubljana, Christmas concert in Auditorium Portorož.

Bank is also motivated to make donations for humanitarian purposes. In such cases they don't charge usual provision (Red Cross of Slovenia, Caritas …). Additional motives sponsorship brings are: realising the sponsor name, raise of image, media coverage, social events, communicating to targeted niche, product/service presentation, competition differentiation, opportunity to tie contacts, increase brand loyalty, sales promotion, etc.

3.1. Bank of Koper attitude to sponsorship

Bank of Koper has positive relation to sponsorship; they sponsor culture, art, sports and humanitarian events and organizations. Bank receives 1600-1700 different sponsorship submissions yearly. Because of limited funds, they can not answer positively to every one. However, 400-500 submissions are approved and this is still a fair percentage. In 2005 and 2006 they approved bigger sponsorship funding to: WTA tennis tournament Bank Koper Slovenia Open, Sailing Association of Slovenia, rally Ferrari race, Basket Club Koper, Handball Gold Club, etc. According to the approved financial contribution of Bank, its status as sponsor can be placed as: exclusive sponsor, main sponsor, and address sponsor, co-sponsor.

3.2. Principles of choosing sponsorship projects

Main principle to choose the sponsorship project is the conformity of sponsored project with the business strategy, goals and target segments of Bank of Koper; they want to be reached with sponsorship. Bank of Koper has produced a Sponsorship manual for this purpose, they address when choosing the right projects. They consider following factors:

- they sponsor organizations, institutions, associations, not individuals (from experience - sponsoring individuals brings to many problems with the delivery of agreement);
- image of sponsored organization (they sponsor organizations, institutions, associations with positive image);
- echo of the project (projects with good communication strategy allow to include and enable more communication forms, they are noticed in wider Slovene area, even if they are of local or regional character);
- timing and geographic harmonization with business activities of Bank, which go on through all year;
- sponsorship or joint sponsorship, when there is a smaller amount of funds, exclusive sponsorship when they sponsor an important event or project;
- exclusive activity (Bank decides for sponsorships that bring them an exclusive position in their activity – banking, as this is a way to build its image and the transparency of their public relations).

3.3. Project selection process

Selection rules are made by marketing department of Bank of Koper. They also collect and accept most of submissions, treat them and prepare the answers, prepare basis for deciding and give an opinion. Head of marketing department arranges received submissions and forwards them into further decision process. Submission has to be made in a written form and has to contain all the elements that allow the marketing department to decide, if they fit with business goals of Bank. These elements are:

- costs;

- time determination of project;

- promotional possibilities;

- structure of target audiences, reached by the project (age, geographic and status determination);

- structure of media, interested in covering the project subject;

- indication, why this project should serve the interests of Bank.

Marketing department also checks the project holder: if he is a Bank business partner; is his abilities are as stated in the submission; if he has at disposal personnel, able to provide promised services; what are his relations with media; has he a personnel in charge for publicity; check his references and the probability that the project will be delivered in the promised framework.

Responsible marketing team weights the appropriateness of project holders. They also decide on the funds amount. About 95 percent of submissions go through this kind of procedure. The remaining 5 percent, submissions exceeding 100,000 EUR are being treated in a different way. They are checked by the board, by president, and later on the collegiums decides its destiny.

3.4. Marketing activities

Marketing activities mix captures additional promotion of the tournament in media - electronic media (TV, internet portals, radio …) and printed media (newspapers, journals …), additional sponsor's promotion, and activities meant for wider public – visitors and popularization of tennis game among youngsters.

3.5. Reasons for participation as official sponsor at the Slovenia Open

Basic reasons for the Bank of Koper participation as the official sponsor at the Slovenia Open WTA Tournament were stated by the Bank President Vojko Čok on the press conference on March 15th 2006:

"First tournament Bank Koper Slovenia Open got very high mark from the organizational, competitive and promotional point of view. I can say that it fulfilled the Bank of Koper expectations, which entered as main sponsor and mark its 50th anniversary. That's why the Bank of Koper decided to repeat our sponsor activity this year, with equal or increased expectations, of course. I believe in the capability of tournament holders and organizers. They are not only one year older but also one year more experienced. Town of Portorož needs similar events and they are also in our interest, as they strengthen the town's recognisability and influence business activity of our business partners, indirectly the activity of Bank of Koper. Bank of Koper will organize the tournament's visit of 700-800 youngsters from all parts of Slovenia, as we spread our banking net through all territory. They will be chosen at the local business units".

3.6. Measurement of sponsorship effects

We can not measure the exact sponsorship effects but we can assess them approximately. Sponsorship effects can be measured with a survey between participants directly after the event or with public opinion pools, in which the interviewed connect the bank with singular direction, strategy or values.

When we talk about direct support to sales, sponsorship shows in the selling effects. We could empirically prove as well, how much contributed the appearance of singular person or team to the sell of certain service.

3.7. Media response

One of the most important sponsorship effects are media publications. There were 60 accredited journalists on the tennis tournament Bank Koper Slovenia Open 2005, from electronic (TV, radio, internet) and printed media. A $140,000 tournament fits in the IV. category of women tennis tournaments of WTA series was very well covered from the media, nationally as much as regionally. In the time of 2005 tournament, September 17th to 25th, TV Slovenia daily transferred one tennis match from the Central court and reported about the tournament in the sport news (after the Evening news and after the Latest news), in the Sport show and some others. Besides TV Slovenia, other televisions reported about the tournament: POP TV, TV Koper Capodistria and Info TV. Live coverage has been produced from three radio journalists of Radio Slovenia. In nine days there were printed more than 80 reports, interviews and tournament articles in all major daily newspapers (Delo, Večer, Dnevnik, Primorske novice, Ekipa, etc.).

In Tournament Press Center it was well provided for good information coverage, from September 19th to 25th, there were organized press conferences with all Slovene players (Katarina Srebotnik, Andreja Klepač, and Maša Zec Peškirič) and with main favorites (Farina Elia, Eleni Danilidou, Medina Garrigues, Klara Koukalova) in front of the big board with all the sponsors logotypes. An official bulletin was issued daily in 200 copies, with all the information about the daily activities on and off the court. Around 300 people read the bulletin in printed version and a few hundred more in electronic version on the official tournament web site www.sloveniaopen.si.

Tennis matches in the time of tournament were visited from 9,000 to 10,000 people. Illustrative information about the power of the tournament: Katarina Srebotnik, Slovene finalist in single and in doubles, was pronounced as the Slovene sports person of the year 2005.

4. DISCUSSION

Commercial sponsorship of sports and other events is in the first place about the improvement of brand equity through raising awareness and/or improving brand image. As sponsorship strategic role in the marketing mix continuous to increase, we should consider its potential to generate a sustainable competitive advantage in the marketplace. In particular, there should be considered two levels of competitive advantage: the competitive advantage of the sponsorship and competitive advantage in the market (Fahy et al., 2004). A sponsor's brand equity is influential in consumers' perceptions of sponsor-event congruence (Roy and Cornwell, 2003). The exposure to a brand's other sponsorships develops an interactive effect which exerts impact on evaluations of current sponsor-event associations; congruence between sponsorships will moderate the interactive effect, thus enhancing or impeding the sponsor-event image association (Chien et al., 2005).

Sponsorship supplements classical marketing communication – marcom elements (advertising, public relations, personal selling, promotional selling, and direct selling). It is true that company chooses sponsorship as an alternative marcom element to achieve wanted strategic goals, mainly economic nature, but sponsorship gains on importance in comparison with other elements. Advertising becomes expensive, its effectiveness decreases, because the target audience is saturated and accepts the messages in a more selective way. Sponsorship allows achieving other communication goals as company builds its image and recognisability in public, credibility, enhances business relationship with target audience, increases the brand awareness, increases sales etc. Commercial sponsorship prevails in the sports related event types. Sponsoring goals are in principle met on a long term.

Regarding our research questions, the study resulted in the following conclusions, mostly descriptive, limited for 'the case' only. Bank Koper Slovenia Open tennis tournament is for sure an event of elegant and prestigious nature. Bank Koper does not sell a typical FMCG product that would need more intense advertising for people to buy it. When sponsoring a sport, which is not a mass sport, it leaves good vibrations in people. They connect and transfer the positive image of the tennis tournament with the Bank of Koper business. The Bank is satisfied with the brand exposure in media and decided to continue with the sponsorship activity. Privileged position of Official sponsor must be seen and felt; it gives a certain competition advantage.

Three basic motivations Bank follows when deciding about the sponsorship projects are: direct or indirect business connection, a communication motive, and making donations for humanitarian purposes. They sponsor culture, art, sports and humanitarian events and organizations. When choosing a sponsorship project, it must be in conformity with the Banks business strategy, goals and target segments, they consider several factors: they sponsor organizations, institutions, associations, and no individuals; image of sponsored organization; echo of the project; timing and geographic harmonization with business activities of Bank; sponsorship or joint sponsorship, when there is a smaller amount of funds, exclusive sponsorship when they sponsor an important event or project; exclusive activity. Elements to be considered through the project selection process are: costs; time determination of project; promotional possibilities; structure of target audiences, reached by the project; structure of media, interested in covering the project subject; indication, why this project should serve the interests of Bank. Marketing activities mix captures additional promotion of the tournament in electronic and printed media, additional sponsor's promotion, and activities meant for wider public. Encouraged by the success of the first tournament, Bank decided to remain sponsor of this event, sponsorship effects were assessed as satisfactory and media response was adequate.

Additional questions for research arise from examination of an event's image transfer to the sponsor, of the sponsor's equity and its impact on sponsorship response. Also, examination of event's property equity on perceptions on consumers' sponsor-event congruence is needed. As a result of its growing importance and lack of attention, more research in the area of event marketing, and specifically the image transfer process is needed (Gwinner, 1997). An exhaustive study (Grimmes and Meenaghan, 1998) of the Bank of Ireland employees' perception of the bank's sponsorship programmes provides a number of additional insights. It seems that the different categories of employees (management, staff) perceived the image transfer of human resources values in different ways. Employees felt that there was more than just its sponsorship projects that made the bank the desirable employer or 'winner' (Lagae, 2005).

A VIRTUE-MATRIX APPROACH TO
MEASURING CORPORATE SOCIAL RESPONSIBILITY IN LITHUANIA

Jade Holmgren
Lithuania Christian College
Kretingos g. 36, Klaipeda, LT-92307, Lithuania
Phone: 370+46+310745;
E-mail: jholmgren@lcc.lt

Key words: *Corporate social responsibility (CSR), stakeholder, virtue matrix,*
                  Lithuania, Partners for Financial Stability (PFS), World Bank,
                  United Nations Global Compact, European Union

1. INTRODUCTION: BEYOND SHAREHOLDERS TOWARD STAKEHOLDERS

Since Milton Friedman published his provocative title, "The Social Responsibility of Business is to Increase its Profits," the debate of corporate social responsibility (CSR) has focused upon the purpose of corporation and to whom it should be held accountable. While arguing that the sole purpose of a corporation should be to maximize its profits and the corporate managers should be held solely accountable to its shareholders, Friedman, however, did not negate the corporation's responsibility to conform to "the basic rules of the society" embodied in law and ethical custom." (Friedman, 1970)

The concept of stakeholders was introduced by CSR advocates to contest the shareholder view of corporate accountability. Instead of taking a multi-fiduciary stakeholder view, Kenneth E. Goodpaster argued that "the conscience of the corporation is a logical and moral extension of the conscience of its principals," thus providing a philosophical underpinning for the differentiated accountability of corporations to their multi-stakeholders. (Goodpaster, 1999)

With the advent of the new millennium, CSR is gaining increasing momentum, thanks to globalization, while the profit-maximizing notion of corporate responsibility is increasingly becoming part of the problems that trail behind globalization than a solution. The Millennium Poll on CSR conducted by Environics International Ltd. in 1999 reveals that two thirds of citizens interviewed worldwide want companies to go beyond their historical role of making profits, paying taxes, employing people and obeying laws. They want companies to contribute to broader societal goals as well.[1] (Environics, 1999)

In order to fulfill the vision of a more sustainable and inclusive society, United Nations Global Compact[2] was launched in 2000 as a voluntary international initiative to advance the ten principles in the areas of human rights, labor, environment, and anti-corruption. Organization for Economic Cooperation and Development's (OECD) Guidelines for Multinational Enterprises (2000) proffers a set of recommendations to multinational

enterprises covering broader ethical concerns, including employment and industrial relations, human rights, environment, information disclosure, combating bribery, consumer interests, science and technology, competition, and taxation.[3] European Union also set itself a new strategic goal in 2000 to become the most competitive and dynamic knowledge-based economy in the world for the next decade, making Europe a pole of excellence on CSR.[4]

2. VIRTUE MATRIX

To help corporations manage their CSR activities, Roger L. Martin proposed a virtue-matrix model to evaluate the returns on corporate responsibility. (Martin, 2002) Martin's virtue matrix consists of two dimensions: the civil foundation at the bottom and the intrinsic frontier above. Two quadrants of the civil foundation are choice on the left and compliance on the right. The intrinsic frontier also comprises two quadrants: strategic on the left and structural on the right.
Figure 1 – The Virtue Matrix (Martin, 2002)

According to Martin, civil foundation consists of norms, customs and laws which corporations either choose to observe (choice) or are required by law to comply (compliance). In consistence with the conventional view of corporate role and Friedman's notion of conforming to the rules of the society, a majority of supply of CSR practices comes from this dimension.

The intrinsic frontier is where responsible corporate behavior takes place for its own sake. When such behavior per chance advances corporation's strategy and increases overall supply of CSR practices through peer encouragement, it resides in the strategic quadrant. Structural quadrant is where social change is not possible without collective efforts from various fronts.

Martin recognizes that the line between civil foundation and the intrinsic frontier is not a fixed one, nor is the line between choice quadrant and compliance quadrant, or between strategic frontier and structural frontier. The civil foundation of a society can be deepened

[4] The political milestones of CSR at the EU level,
http://ec.europa.eu/employment_social/soc-dial/csr/csr_commissionsact.htm

when the socially responsible behaviors in the strategic quadrant are increasingly imitated by peers and thus become norm or those residing in the structural quadrant are later mandated by law. Likewise, norm and custom can also be coded by law and migrate to the compliance quadrant, and vice versa.

Since nations differ in their general levels of civil foundation, anxiety is bound to occur when corporations cross borders. Martin also suggests that supply for CSR has to come from the intrinsic frontier if the supply is to gain any public credit.

In order to understand how the virtue matrix applies in Lithuania, the next section first surveys the legal foundation of the country in support of CSR. This is necessary in order to identify from the two international surveys the practices and attitudes that should belong to the compliant quadrant in the later section.

3. THE INSTITUTION OF LAW IN SUPPORT OF CSR IN LITHUANIA

In October 1992, Lithuania adopted by referendum a new Constitution, establishing a parliamentary democracy and the rule of law. Since then, Lithuanian administration has made great strides in achieving compatible standards with EU and other international bodies. The legal framework is described in four areas of concerns consistent with those of the UN Global Compact.

In the area of human rights, all the basic human rights are established in the Constitution of Lithuania and any international treaty ratified by the Lithuanian Parliament forms an integral part of Lithuanian law. As of July 2006, Lithuania ratified the European Convention for the Protection of Human Rights in 1995 and the majority of all international human rights treaties.[5] Under the assistance of United Nations Development Programme (UNDP), the Lithuanian Parliament also approved a National Action Plan for the Promotion and Protection of Human Rights in 2002.[6]

In the area of labor, the Lithuanian Parliament passed the new Labor Code[7] in 2002 in alignment with the key provisions of the EU, International Labor Organization (ILO) and the European Social Charter. The new Labor Code is the most important law regulating the employment relationship between employers and employees in Lithuania.

In terms of environment, Lithuanian government adopted a National Strategy for Sustainable Development in 2003, which is consistent with UN Rio Declaration on Environment and Development and its action program Agenda 21.[8] The National Strategy recognizes sustainable development as a compromise among environmental, economic, and social objectives of the society.

In 2002, the Lithuanian Parliament approved a National Anti-Corruption Programme.[9] The government also ratifies the United Nations Convention against Corruption (UNCAC) in

December 2006. In a most recent review of Lithuania's compliance with UNCAC, Lithuania was commended for its comprehensive legal and institutional framework to fight corruption. Lithuania also has in place the operational independent apparatus both in preventing and suppressing corruption and was lauded as examples of good practice to be followed by other countries. (Klemencic, 2006)

Being a new member state of the European Union, Lithuania has undertaken the task to contribute to the European strategy on CSR through the EU CSR High-Level Group Work programs.[10] In addition, UNDP has been working with Lithuania since 1992 for the promotion of sustainable human development and other development issues that are closely related to CSR. In 2005, the National Network of Socially Responsible Business in Lithuania was established to improve business strategies for the promotion of the UNGC Ten Principles.[11]

The legal survey above indicates that the legal framework in Lithuania consistent with international CSR standards is already in place. The next section will explore how the two international surveys on CSR in Lithuania reflect on the matrix.

4. MAPPING THE MATRIX

In 2005 the World Bank surveyed business leaders from 243 companies in the Baltic states (80 companies in Lithuania) across different economic sectors, ownership types and sizes to identify private sector views of CSR and the ways in which these views are put into practice.[12]

Partners for Financial Stability Program (PFS) has surveyed CSR reporting of 110 largest listed companies in eleven Central and Eastern European (CEE) countries, including the three Baltic states, Poland, Czech Republic, Slovakia, Hungary, Slovenia, Croatia, Bulgaria, and Romania, since 2003.[13] As of September 30, 2006, seven surveys have been conducted by the PFS.

The PFS survey focuses entirely on English information disclosure in the annual reports on corporate governance, environmental policies and social policies. Only ten largest listed companies, representing 35% of total market capitalization were surveyed. The survey's representation of overall CSR practices of Lithuanian companies is but symbolic. Nevertheless, the survey may give us a glimpse of how transparent the largest companies are in Lithuania.

   – ethical conduct (65%)
   – transparency in operations (60%)
   – addressing stakeholders concern (40%)
   – environmental protection (30%)
   – public relations (< 20%)
o Company role
   – listening to stakeholders (73%)
   – contributing to charities (> 60%)
	o CSR activities
	   – social inequality correction (10%)
	   – stakeholder partnership (< 10%)

CIVIL FOUNDATION – CHOICE	**CIVIL FOUNDATION – COMPLIANCE**

o Company's role
   – making a profit (> 90%)
   – ensuring job securities (88%)
   – protecting employees' health (85%)
   – never using child labor (> 80%)
   – protecting environment (> 80%)
   – creating jobs (80%)
	o CSR activities
	   – compliance with regulations (40%)
	   – environmental protection (30%)
	o Company's role
	   – paying taxes (96%)
	   – complying with regulations (91%)

Three categories in the World Bank survey reveal Lithuanian business leaders' general perception of CSR: their understanding of stakeholders, CSR activities, and the company's role in society. Although perception does not equate actual performance, a high level of understanding is more likely to lead to conformity of corporate behavior.

For the sake of mapping, if a perception receives over 75% of responses, the perception is placed in the choice quadrant. If a perception has to do with legal compliance, that perception is placed in the compliance quadrant. Some perceptions may not produce economic benefits if acted upon alone. Hence, they are placed in the structural frontier. The rest of the perceptions are placed in the strategic frontier.

In the civil foundation, other than the conventional company roles of making a profit, paying taxes, complying with regulations, and creating jobs, there is a high degree of consensus among Lithuania business leaders that the main roles of company should also include protecting employees' health, never using child labor, and protecting environment. In contrast, relatively low percentages of respondents consider complying with regulations and protecting the environment as part of CSR activities. This may be due to different interpretations among Lithuanian business leaders of the two terms.

As many as 65% of respondents consider ethical conduct to be socially responsible activities, followed by transparency in operations (60%), addressing stakeholders concern (40%),

environmental protection (30%), and public relations (less than 20%). These perceptions are placed in the strategic frontier.

It is not surprising that shareholders receive the most responses as the main stakeholder. However, judging by the convention view of business, it is curious that the percentage is not higher (only 71%). Other than the shareholders, the next two stakeholders receiving the most responses are employees (51%) and customers (36%). Since no stakeholder breaks the 75% threshold, stakeholder concern remains a strategic consideration in CSR management.

Only 10% of respondents consider social inequality correction CSR activities. Since the social inequality cannot be addressed by one company alone and since it may lack economic incentives for other company to follow suit, this perception is placed in the structural frontier.

A closer look at the perception mapping seems to reveal an inconsistent picture. While there is a high degree of consensus among Lithuanian business leaders about non-conventional roles of company, including protecting employees' health, and protecting the environment, their perceptions of employees and local communities as main stakeholders do not match up. And only 30% of respondents consider protecting the environment a socially responsible activity. One possible explanation is that such terms as stakeholders and CSR are still foreign to most Lithuanian business leaders. This may result in a certain degree of bias in their responses.

4.2.   Employee Projects

Table 2 – Virtue Matrix Mapping of Employee Projects

STRATEGIC FRONTIER	STRUCTURAL FRONTIER

o Annual Report Disclosure (PFS)
    – Employment Policy (4/10)
    – Employee Development/Benefits Policies (7/10)
    – Health and Safety Policy (2/10)
    – Labor standards compliance reporting (1/10)
	o [Annual Report Disclosure] (PFS)

CIVIL FOUNDATION – CHOICE	CIVIL FOUNDATION – COMPLIANCE
o <u>Anti-discrimination policies</u> (norm) o <u>Employee training</u> (nearly all) o Code of conduct (80%, half written, half verbal) o Employee health protection plan (majority, not norm)	o ILO standards (41% implementation rate).

Contrary to the weak perception which regards employees as a key stakeholder (50%) and social inequality correction as CSR activities (10%), anti-discrimination policies and employee training programs are the norm among Lithuanian companies. In addition, a great majority of Lithuanian companies have employee health protection plans and either written or verbal codes of conduct for the perceived benefit of improving employee relations.

Although the new Lithuanian Labor Code aligned with ILO standards has entered into force since 2003, only 41% of Lithuanian companies actually implement it and as many as 38% of them are not aware of the standards. Filling this awareness gap should effectively improve the law compliance rate and enrich the civil foundation for ethical employee relations.

According to the PFS survey, publicly traded companies in Lithuania may choose to disclose their employment practices in their annual reports for strategic reasons. The most reported practices are their employee development and benefit policies. Four out of the ten largest listed companies disclosed their employment policies on the annual report, while only two reported health and safety policy and one reported their compliance status with the labor standards. These companies are likely to have more prominent CSR practices than others so as to put them in the strategic frontier. To create a level playing field and enrich the civil foundation, mandatory reporting will be necessary.

4.3.   Social Projects

Table 3 – Virtue Matrix Mapping of Social Projects

STRATEGIC FRONTIER	STRUCTURAL FRONTIER
o Social projects (55%) – Health (>50%) – Education (>50%) – Community development (<50%) – Technical training (<30%) – Support to ethnic minorities (<10%) – Housing (<10%) – Other (> 30%) o Annual Report Disclosure on Social policies – Social performance (28%) – Community patronage/sponsorship (3/10)	o [Annual Report Disclosure on Social policies]
CIVIL FOUNDATION – CHOICE	**CIVIL FOUNDATION – COMPLIANCE**
o [Social projects] (55%)	

A majority of Lithuanian companies (55%) are increasingly engaged in social projects for perceived benefits such as better reputation, better local community relations, survival of business in the long term, and enhanced shareholder value. Again, the concern for local community relations should suggest that local community be a key stakeholder. On the contrary, only 5% of respondents agree. Those who are engaged in social projects are most likely to collaborate with civil society organizations (CSOs), followed by municipal institutions, other businesses, and governmental institutions. The three most popular social project areas that Lithuanian companies are engaged in are health, education, and community development. Their involvement in social projects may fall into the strategic frontier if the economic incentives are strong enough to invite other companies to follow suit. Considering the high percentage of Lithuanian companies involved in social projects, more awareness, recognition and peer pressure may significant improve CSR supply in this quadrant.

Reporting social involvement in the annual reports is not a widely accepted practice in Lithuania. Only a strategic few disclose their social performance and community involvement in the annual reports, according to the PFS survey. Since social performance reporting is not necessarily aligned with economic incentive (structural frontier), collective pressure may be needed to increase its supply.

4.4.   **Environmental Projects**

Table 4 – Virtue Matrix Mapping of Environmental Projects

STRATEGIC FRONTIER	STRUCTURAL FRONTIER

o Environmental projects (68%)
o Environmental education to employees (33%)
o Environmental certification (29%)
o Annual Report Disclosure on Environment
  – Environmental performance (31%)
  – Compliance with environmental standards (3/10)
  – Report on water and energy use (1/10)
  – Disclosure of responsible parties (0/10)
  – Supply chain management policy (0/10)
	o Collaboration of environmental projects (majority)
	o Supply chain management
	o [Annual Report Disclosure on Environment]

CIVIL FOUNDATION – CHOICE	CIVIL FOUNDATION – COMPLIANCE
o [Environmental projects] (68%)	o Recycling programs (50%) o Environmental Impact Assessment (EIA) (59%)

Consistent with the understanding that environmental protection is one of company's main role in society, over 68% of Lithuanian companies engaged in environmental projects during the past three years and they are most likely to collaborate with municipal institutions, government institutions, and other businesses (strategic frontier or choice civil foundation). Currently only 29% of Lithuanian companies have an environmental certification, which is more important for large companies engaging in international business (strategic frontier). Considering that both recycling and environmental impact assessment are mandated by law (compliance quadrant of the civil foundation), it is not surprising that they are widely practiced among Lithuanian companies.

Only 31% of Lithuanian companies voluntarily disclose their environmental performance in the annual reports and only three out of ten largest listed companies in Lithuania disclose their compliance status with the environmental standards in the annual report. (Strategic frontier) One company reports its water and energy use. No company discloses who or which department is in charge of environmental affairs inside the company and how the company integrates its environmental policy with supply chain management. Transparency of environmental practices is still in short supply. (Strategic frontier)

A noticeable absence in the reporting by the ten largest listed companies is their supply chain management policy. Environmental standards create a level playing field, allowing companies to compete on the same ethical standards. However, there is little economic incentives for companies to push their suppliers to adopt the same standard. To ensure that the environmental standards are not compromised throughout the supply chain, external pressure for collective actions, either voluntarily or involuntarily would be critical for its delivery.

4.5.   Governance and Anti-corruption

Table 5 – Virtue Matrix Mapping of Governance and Anti-corruption

STRATEGIC FRONTIER	STRUCTURAL FRONTIER

o Anti-corruption policies (24%)
o Annual Report Disclosure on Governance
  – Governance Structure (7/10)
  – compliance with corp. governance code (0/10)
  – shareholder's rights (0/10)
  – code of business conduct (0/10)
o Annual reports (68%)
	o Policies for financing public candidates (13%)
	o [Annual Report Disclosure on Governance]

CIVIL FOUNDATION – CHOICE	CIVIL FOUNDATION – COMPLIANCE
o Stakeholder consultation (79%)	o Annual Report Disclosure (PFS) – Audit relation information (only public companies) o Corporate governance code (2007)

It is noteworthy in the World Bank Survey concerning the level of transparency among respondent companies. Only a minority of companies have adopted anti-corruption policies (24%) and policies on financing candidates for public offices (13%). The percentage of companies planning to have an anti-corruption policy is expected to increase to 30% while the percentage of companies with policies for financing candidates is expected to decline to 8%. This declining trend of the latter may imply limited or no economic benefit of doing so, making them structural quadrant activities whereas the former may be a strategic frontier behavior, driven by enlightened self-interest. Further investigation is nevertheless needed to identify the motivation behind the divergent trends of the two practices.

Regarding annual report disclosure, the Vilnius Stock Exchange of the OMX Group requires that its members disseminate information including annual reports, to the investors via the exchange's website in both Lithuanian and English.[14] Not surprisingly, all ten companies have published English annual reports, which are also accessible on the internet. Out of the five corporate governance disclosure items, all ten Lithuanian companies surveyed have included the audit relation information in their annual reports (compliance quadrant) while only 7 of them have disclosed their governance structure in their English annual reports (strategic frontier). Starting 2007, all companies listed in the Vilnius Stock Exchange is required to report to the Exchange their compliance status with the Corporate Governance Code and explain their non-compliance.[15] (Compliance quadrant)

The Corporate Governance Code approved by the management board of the Exchange in 2004 and revised in 2006 covers relationships between bodies of corporate management and supervision, the company's shareholders and stakeholders. As a result of this new requirement, it is expected that the corporate governance compliance by listed companies in Lithuania should see significant improvement in year 2007. As for non-listed companies, their voluntary compliance with the corporate governance code is likely to remain in the strategic frontier.

---

[14] Source: http://www.baltic.omxgroup.com/index.php?id=2805
[15] Source: http://www.baltic.omxgroup.com/index.php?id=2700

According to the World Bank Survey, 79% of Lithuanian companies regularly consult their stakeholders, thus qualifying the practice a choice quadrant activity. Considering their perception of stakeholders, this means that they most often consult shareholders, employees and customers on a regular basis.

5. BARRIERS FOR CSR SUPPLY AND FORCES TO INCREASE ITS SUPPLY

Roger Martin identified two major barriers to increasing socially responsible behaviors of corporations: a dearth of vision from corporate leaders and the lack of economic incentives. The first concerns the strategic frontier while the second the structural frontier.

5.1.   The Strategic Frontier

A dearth of vision implies that corporate leaders are unable to see the potential benefits of CSR behaviors and therefore unwilling to take the risk of engaging in the CSR activities that fall into the strategic quadrant. Fortunately, the case of Lithuania is not a pessimistic one. The World Bank Survey shows that only 9% of Lithuanian business leaders do not see any internal benefit from adopting CSR practices and only 1% do not see external benefits. This explains the increasing supply of CSR activities in the strategic frontier in Lithuania. The high awareness of perceived benefits by no means guarantees their engagement in such activities. More concerted effort may still be needed.

Two forces are specifically related to the increase of CSR supply in the strategic frontier: consumer agitation and peer encouragement. (Martin, 2002) In a developed country with a high level of concern for the common good, consumer agitation may create an ample demand for socially responsible products and services. As soon as business leaders are able to identify the unfulfilled demand for CSR, the economic incentive should become self-evident and the risk minimized for providing them. Like other post-Soviet societies in the CEE region, Lithuania is only in its nascent stage of developing a civil society. The exercise of consumer power is just awakening while caveat emptor predominates the marketplace. To break the dominance will require a continuous consumer education and legal protection to tip the balance of the scale.

Success stories and best practices of CSR in the strategic frontier can often beget more success stories and innovation by other companies. The establishment of the national network of socially responsible businesses in Lithuania serves as a congenial platform for sharing CSR experiences among businesses. Publicizing the best practices helps lower the perceived risks of CSR engagement and encourages virtuous competition among peers for best practices. The World Bank Survey shows an increasing trend of CSR supply in Lithuania within the next five years in the areas of anti-corruption policies (from 24% to 30%), disclosing environmental performance in the annual reports (31% to 38%), disclosing social performance in the annual reports (28% to 39%), and engagement in social projects (55% to 60%). These numbers imply a catalyzing effect among Lithuanian companies for the supply of CSR practices in the strategic frontier, where the public expectation has not been well formed and corporate supply of CSR is most likely to receive public praise and thus engender goodwill. The increasing supply of CSR practices in the strategic quadrant will eventually migrate to the civil foundation, advancing the norm and custom of the society.

5.2.   The Structural Frontier

The lack of economic incentive often leads to corporate inertia to CSR innovation. This creates the most problem for the supply of ethical conduct in the structural frontier. Martin suggests that the most effective tool to tackle the corporate inertia is through collective action from government regulators, non-governmental organizations (NGOs), or the corporate leaders themselves.

The government's role is two-pronged: administering sticks (regulation), and/or offering carrots (economic incentive). In the case where economic incentives are missing, direct regulation provides a level playing field in which no individual company is disadvantaged for engaging in CSR activities. Alternatively, governments may use public policy to offer economic incentives to motivate businesses to engage in CSR innovation.

A few downward trends were noted in the World Bank Survey: a few large companies plan to stop publishing the annual reports; the percentage of companies having a policy of financing public campaign is expected to decline; fewer companies plan to consult their stakeholders on a regular basis. Further investigation on the motivations behind these trends may help identify proper public policy tools to use to effectively increase CSR supply.

According to the World Bank Survey, the greatest barrier to CSR practices is the lack of appropriate regulation, followed by the cost concern, no link to financial success, lack of visible results, no government involvement, changeable government policy and others. The greatest perceived risk in adopting CSR practices is the increased operating cost, followed by adverse impact on profitability and increased regulation. A great majority of Lithuanian companies believe that tax incentives can best assist them in improving CSR practices. The top ranking barriers and perceived risks are essentially a direct result of a lack of economic incentives in pursuing CSR activities, hence demanding a government intervention either in the form of regulation or creating incentives.

As regulators, governments will always face the challenge of designing effective public policies to achieve its ends. Despite what the Lithuanian government has done to integrate internationally harmonized CSR standards to the Lithuanian laws and regulations, about two thirds of Lithuanian business leaders perceive that government policies do not encourage CSR investments, 24% do not know, and only 11% believes that government policies encourage CSR investments. This perception begs for an answer. The first and the most straightforward answer would be weak law enforcement mechanism as it relates to stick administering and/or insufficient supply of carrots. It may also be possible that the perception is skewed. Lithuanians often say that laws are needed just to break them, revealing a tenacious Soviet legacy of a deep distrust in the rule of law. (Vasiljeviene, & Vasiljevas, 2006) It is curious how much the Lithuanian perception of government policies is still influenced by such a Soviet legacy.

As the survey shows, nearly one quarter of Lithuanian business leaders are not aware of the impact of government policies upon CSR investments. Another statistics show that only 41% of the Lithuanian companies implement the core labor standards adopted by the ILO, which has been integrated into the Lithuanian Labor Code effective since 2003. This leads to a third possible explanation: low awareness.

Lithuania's transition from the Soviet polity to the rule of law was largely accomplished by importing laws and standards from the developed countries and the international societies where the observed norms and customs are higher than those observed in Lithuania. This approach creates great tension between the two quadrants of the civil foundation because the imported laws and standards are not rooted in the norms and customs of the Lithuanian society. This also creates a public impression of changeable government policy. Combined with the Soviet legacy of public distrust in the rule of law, the observance of these laws and standards is undermined.

One possible solution for this is increasing dialog between the government and its stakeholders both during the process of making law/policy for consultation and awareness raising, and after for compliance assurance and policy evaluation. The survey confirms that more than 60% of Lithuanian business leaders agreed that more dialog with stakeholders and government would make CSR practices more relevant.

In addition, 42% of non-financial service companies in Lithuania (more than other subgroups) identified the lack of government involvement a high barrier. Since the service sector represents 59%[16] of Lithuania's gross domestic product and has been one of the key drivers for growth, this finding may imply a significant structural barrier for CSR engagement. Further investigation can help identify the types of government involvement needed in the non-finance service industry.

Another cause of public distrust could be the slow public sector reform, particularly relating to anti-corruption. Since government is an important stakeholder of businesses not only as a regulator but also as public service provider, a tarnished government image would no doubt greatly damage the government's desire to promote CSR.

Aside from the government, Martin suggests that the most effective pressure for collective actions would be that from corporate leaders themselves. The intention is clear: to avoid the onerous one-size-fits-all government regulations. Such initiatives require visions from among corporate leaders driven by enlightened self-interest for the common good. Despite its popularity among many developed countries, the World Bank Survey has no indication of concerted effort made by Lithuania companies to increase CSR supply.

Perhaps a more effective instrument than collective actions is mandatory disclosure of CSR practices. The mandatory disclosure of compliance status with the Corporate Governance Code by all listed companies in Lithuania starting 2007 is a good example. The mandatory disclosure can produce two effects: 1) increasing transparency without heavily increasing regulatory cost, thus relying upon the market to reward and discipline corporate behaviors; 2) encouraging peer competition for better practices. Many EU member states have adopted mandatory disclosure to encourage CSR practices, most prominently in the areas of environment, social impact, and socially responsible investing.

---

[16] World Bank Survey, p.92.

6. CONCLUSION

From a transition economy to a new EU member state, Lithuania has adopted a top-down approach for CSR development by importing western norms and standards to Lithuania to enhance its civil foundation. Despite the widespread public complaint upon the government, the burden of CSR development largely rests upon the government, at least in the initial phase, due to the lack of an active civil society and perhaps the inured public proclivity to rely upon the government to provide for the common good, another Soviet legacy.

Against this background, the Lithuanian government has an indispensable role to play in the promotion of CSR. This research finds that mandatory reporting on CSR activities can be a very effective tool to increase CSR practices falling in the structural frontier. Government should also take an active role in promoting CSR awareness among the public and the businesses, thus stimulating corporate visions and consumer agitation.

This research finds that business awareness on ethical employee relations is the highest of all areas researched in this paper. When most, if not all, Lithuanian companies have an anti-discrimination policy and provides employee training, those who don't are likely to pressured to follow to avoid market discipline. However, their conformity to the norm may gain little or no credit for the companies.

Considering the significant numbers of companies voluntarily involved in social and environmental projects, the awareness level among Lithuanian companies is by no means negligible. More companies are likely to be motivated to follow the trend for perceived economic benefits. The establishment of the national network of socially responsible businesses in Lithuania thus serves as a congenial platform for sharing CSR experiences among businesses. Despite the peer encouragement, the disincentive for non-conformity may not be strong enough to overcome corporate inertia. Public policy may help provide incentives to increase CSR supplies in these areas.

Another effective tool to counter corporate inertia where economic incentives are absent or awareness level is immaterial is mandatory reporting. This tool has been effective in increasing accounting reporting transparency in the past while its effect on Lithuanian companies' compliance with the corporate governance code remains to be seen. The greatest challenge to Lithuanian policy makers may be to maintain an open dialog with their stakeholders for the assurance of higher transparency and compliance, and to speed up public sector reform to break down the deeply ingrained public distrust. A strong political volition is required to see significant improvement.

CSR promotion requires active participation from both the public and the private sectors. The virtue matrix is meant for helping corporations to manage their CSR activities strategically on the ground of enlightened self interest, and to increase their shareholder value. It can also help policy makers identify effective policy tools to facilitate corporate supply of CSR practices in different quadrant. With concerted efforts from both sectors, Lithuania should see its civil foundation greatly enhanced in the years to come, reaching the pole of excellence on CSR.

1. INTRODUCTION

An important determinant of the Croatian economy development lies in the development of small and medium enterprises, which is not based only on the number of start-ups but also on the positive change of infrastructure as pre-condition of such development.

As infrastructure significantly determines not only economic but also social behaviour of business subjects, this work aims to investigate the interrelation of small business development, entrepreneurial infrastructure, and social responsibility of companies. The basic hypothesis of this paper is: **The concept of corporate social responsibility provides means for development of entrepreneurial infrastructure, and consequently the SME sector.**

 The aim of research is to determine the extent to which business subjects are socially responsible and to which extent this responsibility is determined by legal regulations on one side, and by understanding of the role each business subject plays in a particular society on the other side. Right because of that the concept of social responsibility is the focal point of this research.

Responsible Entreprenuership, Responsible Business Practice, and *Corporate Social Responsibility* are not the areas of responsibility only for big companies. Disregarding their size (in terms of employees, turnover or assets) or ownership structure, companies voluntarily integrate their business activities into the social framework within which they operate, taking into consideration the issues of environment protection and interaction with the main factors in their surrounding (*European Commission's Green Paper*).

In a wider sense, the concept of social responsibility is linked to the *Triple Bottom Line approach*, or the idea that sustainability of any organisation (consequently also of any company) is conditioned by financial security, by minimization of the negative impact on the environment and harmonisation of activities in terms of social expectations.[1]

The SME sector[2] is nowadays a significant factor of economic development in many countries. Small and medium sized enterprises make more than 90% of global operations and employ between 50 and 60% of global workforce. It is estimated that in 2003 in the EU there were more than 20 million small and medium enterprises, which provided employment for more than 80 million employees. During the last decade, small and medium enterprises in Croatia have recorded an increasing number of organisational forms: sole traders, limited companies, cooperatives. The SME sector in Croatia accounts for 99% of all registered entities. It employs 55% of the total number of employees, accounts for the growth of 44% GDP and 60% of the total exports.[3] As they represent an important economic power and have a key role in the national economic development strategy,[4] any research into small and medium sized companies and their relation to the concept of social responsibility will have a wider economic and social significance.

Assuming that social responsibility of small and medium enterprises is determined by general and specific features of the SME sector, the main features of small and medium sized enterprises in Croatia will be presented pointing to those which can have a significant influence on comprehension and implementation of the social responsibility concept.

Also, the development level of entrepreneurial infrastructure will be analyzed considering the forms and spread of support to small and medium entrepreneurs in Croatia, with a special highlight on the concept of social responsibility of SMEs.

This work consists of five parts. The introductory section defines the research problem, hypothesis and work structure. The second section describes the main features of the SME sector in Croatia based on the results of research carried out in 2003, 2004, and 2005. Also, entrepreneurial support (infrastructure) is analyzed in terms of contents, coverage and variety of support segments.

The third section deals with the basic elements of the social responsibility concept especially highlighting the relation between CSR and the SME sector. The fourth section presents the entrepreneurs' attitudes to ways, motives and level of inclusion of the CSR in Croatia,

---

[1] According to: *Observatory of European SMEs 2002/No 4: European SMEs and social and environmental responsibility.*
[2] The SME concept is defined in different ways in different economies. The usual definition considers the number of employees and the value of assets. In the EU, SME are enterprises with less than 250 employees.
[3] According to: Ministry of industry, labour and entrepreneurship, September 2006; www.mingorp.hr; 25.10.2006.
[4] *Program razvoja malog gospodarstva*, Vlada RH, 2001.

pointing out obstacles and opportunities to define activities and support measures in implementation of the concept of social responsibility in the SME sector.

The concluding section determines the basic directions and activities of the CSR implementation in Croatia.

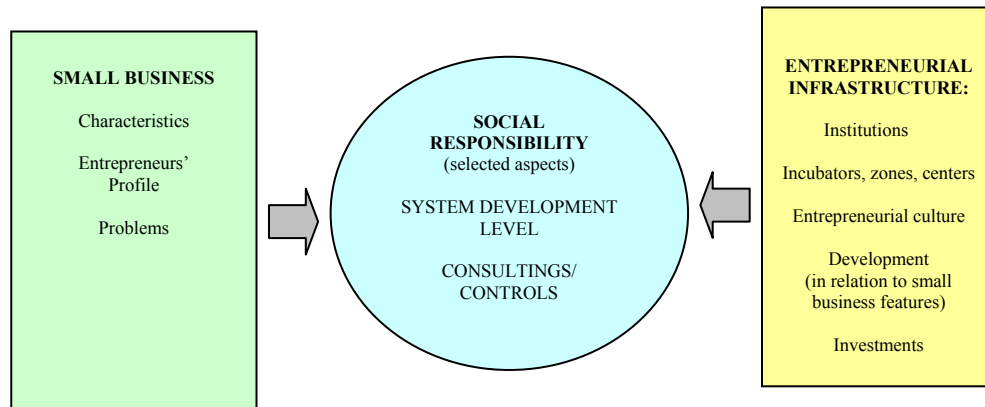
The *Figure 1* shows the model of interrelation of small business, entrepreneurial infrastructure and social responsibility.


Figure 1. Model of research into social responsibility of the SME sector

2. ENTREPRENEURSHIP IN CROATIA

2.1. Basic characteristics of the small business sector

Compared to big companies, small and medium enterprises have different characteristics in terms of structuring and procedures, organizational culture and behavior, treatment of human resources, and relation to market and customers.[5]

Organizational structure of SME is usually shallow with few management levels, limited range of delegation of authority and responsibility, low level of specialization, and vague distribution of activities, but very flexible with relatively short information flows.

In this sector, formal rules and internal operation procedures are generally not developed. The level of procedure standardization and formalization is low. Planning and control system is simple, including the usual existence of informal evaluation, control and reporting procedures. In compliance with organization, operational processes are flexible and adaptable.

Work and behavior of employees is predominantly influenced by owner-managers, their sets of values and behavior patterns. As a rule, procedures and behavior are result oriented, and personal authority and responsibility of the owner-manager are unquestionable. General

---

[5] According to: *SMEs characteristics, strengths and weaknesses versus large organisations; in: Rabbe, S.S; Welge., A.; Martin, K.; (2006); Sustainable management in the global economy - An innovative approach to improve small and medium sized enterprises SME); www.ctw-congress. De/ifsam/download/track_20; 25.11.2006.*

knowledge and ability to manage a variety of business activities are required. Creativity and innovation are encouraged.

In terms of markets, SMEs are mainly oriented to the local markets, less frequently to the national or international markets. In most cases they have a small number of customers, with whom they are personally acquainted, and a limited number of external contracts.

The main weaknesses of SMEs are generally related to a higher or lower degree of accessibility to the main resources: finance, technology, knowledge. On one hand, financial limitations often result from the owner-manager's unwillingness to diversify the ownership structure. On the other hand, access to the international financial market is limited due to informational asymmetry, lack of security and reputation.

SMEs also have limited access to knowledge, whether they want to attract and maintain people with special talents, develop their own educational or training systems, or have their human resources specialize within the existing organizational structure. Double capacity for individual positions is rarely provided, formal differentiation of functions are rare, and thus also specialization in specific knowledge and skills.

During the fifteen years of intensive development of the SMEs in Croatia, the main characteristics of this business sector have become obvious. This work will highlight those that can have a significant effect on defining and implementation of the social responsibility concept in the Croatian SMEs.

It is to be noted that coherent empirical research in entrepreneurial activities is rare in Croatia. Also, statistical data follow-up, similar to that carried out in the EU[6], is not defined, and therefore the possibility of strategic influence on development and encouragement of small business is questionable.

According to the results of available research,[7] the Croatian small business is predominantly led by the male population aged 40 to 50 (54%).[8] Namely, among entrepreneurs more than two thirds are men. Considering the stimulation system for target entrepreneurial groups (women, young population), it is realistic to assume that the share of women entrepreneurs is less than one third. Namely, there is no empirical research to support the thesis that it is only nominal proprietorship and engagement of women in entrepreneurship without their real activities in management or responsible positions in small business.

Lack of knowledge, considering the demands of environment and business, even when operating in the local market, can be a serious problem of small business in Croatia nowadays. This refers both to formal education and to business experience in general. Namely, 48% of entrepreneurs have secondary education, and 21% of them college or university education.

---

[6]E.g.: *Observatoty of European SMEs*, European Commission
[7]This refers to the research results obtained in the project: Leburić, A., Krneta, M., *Profil poduzetnika – Socio-ekonomsko istraživanje 2003.,* Naklada Bošković, Split, 2004.
[8] Entrepreneur profile research was carried out on the representative pattern of 642 entrepreneurs (8% of the entire set of 8.028 entrepreneurs) who had used the loans of the Croatian Bank for Restructuring and Development in the period up to 2003.

Research results also show that secondary education or only elementary education is the predominant education level in the families of entrepreneurs (in 43% of entrepreneurs father has secondary education and in 28% mother has secondary education).

Most entrepreneurs (83%) do not have any preliminary entrepreneurial experience either in establishing or managing some form of business.

The population of women-entrepreneurs, nominal or real, is on average more educated in comparion to men: 57% of them have obtained higher formal education, but they also rarely have preliminary entrepreneurial experience (16%).

More than half of entrepreneurs can speak a foreign language, but about one fifth of them can speak only their mother tongue. As most entrepreneurs are oriented on the local market (50%), in competition that majority of them (51%) describe as strong and sharp, it can be assumed that their available knowledge and experience have to a large extent affected their start and formulation of business activity as well as their current operation.

The fact is that almost 70% of entrepreneurs started up in the activity in which they had been previously employed, which allows the assumption that they are at least generally informed about the way of operation.

2.2. Motives and intensity of entrepreneurial activity

The results of the *GEM research for Croatia in 2005* show that the *TEA necessity index*[9] increased in 2005 to 3.09 (in comparison to 0.85 in 2002). For the same period, the *TEA opportunity index* for the population of Croatian entrepreneurs was 2.92 in 2005 in comparison to 2.18 u 2002. The TEA index in Croatia increased from 3.62 in 2002 to 6.11 in 2005, which meant moving from the 32nd to the 19th position among countries included in the GEM project.[10]

The research results suggest that in the segment of SME development Croatia is faced with a sudden increase of entrepreneurial activity (at the level of setting up new sole proprietorships and companies). Entrepreneurial activity is for the most part motivated by existence of some other way of earning one's living, e.g. working for someone else in the SME sector, because the already set up businesses operating for more than 42 months are developing and increasing their workforce, or obtaining a job in large enterprises that are in the breakthrough stage.

If in the current entrepreneurial population knowledge is the limiting factor of an efficient operation and expansion to markets beyond the local market, it is realistically assumed that the new entrepreneurs will be faced with the same problem and that the available knowledge and experience will have a decisive effect on the rate of survival of start-ups in the near future. It is also obvious that acquiring the lacking knowledge and obtaining the needed

---

[9] *TEA index – Total Entrepreneurial Activity* index expresses the number of people in 100 adults 8population aged between 18 and 64) trying to set up their own business or being owners/managers in some active enterprise operating not longer than 42 months. *Necessity –based entrepreneurs* are entrepreneurs because they did not have an alternative choice. They are compared to *opportunity-based entrepreneurs* who are entrepreneurs because they took up an opportunity. – *Global Entrepreneurship Monitor Hrvatska 2002*, p. 16;

[10] *GEM project* included about 40 countries (in 2005, 35 carried out this research using the same methodology). It is estimated that the countries included in the *GEM project* make 65% of the world population and 92% of the world GDP.

experience represents the crucial factor of influence on the survival of the SME sector in Croatia.

In the SME sector in Croatia, micro enterprises are predominant (72%).[11] Their developmental orientation is relatively limited. One quarter of all entrepreneurs are thinking about developmental breakthrough. Most of them think either that long-term development planning is pointless (18%) or that their current position is good (24%) or they are aware of the need to plan and implement long-term development of their business, but do not have the possibility to control that segment (23%).

The predominant size of small and medium enterprises in Croatia in addition to lacking (often inadequate) knowledge and experience, and economic strength to use the available knowledge[12] affect the limited capacity of small and medium enterprises in terms of strategic planning. This most frequently results in untimely noticing of business opportunities or in blindness to developmental possibilities. Small and medium enterprises neither have strategic management nor awareness of the need for strategic development.[13]

However, the research results[14] suggest that entrepreneurs are mostly aware of the limitations related to available knowledge and experience. Namely, more than half of them estimate their developmental prospects (53%) and technological equipment (59%) as moderate. Just under half of them (49%) are also critical towards the available intellectual capital (in terms of their own education and education of their employees, availability of opportunity to acquire new skills and knowledge) and possibility to computerize their operations (47%). Still, most entrepreneurs (63%) estimate that the possibility to ensure the needed funds is moderate, or that finance is the main lacking resource.

Most significant for their business are considered the economic factors, including the problem of financing (40%) and knowledge of legal framework (25%). Less decisive factors in their opinion are provision of professional skills (14%) and favorable political conditions (13%).

Consequently, when defining the profile of the Croatian SME sector in general, the results of the comparatively rare empirical researches suggest that:

- Entrepreneurial activity is increasingly selected as the way to earn one's living (most frequently as solution to the current status of unemployment, unregistered work with or without compensation),

---

[11] Meaning an enterprise with up to 10 employees.

[12] Referring to the development level of the professional knowledge markets available to entrepreneurs in the form of consulting services. In principle, it can be said that such market is comparatively undeveloped – in the stage of professional formation and establishment and dependent on influence factors beyond the entrepreneurial requirements and needs. For instance, any form of entrepreneurial proposal elaboration (such as business plan or investment study) are demanded only because without such documentation entrepreneurs are not allowed to apply for loans or start negotiation with potential investors (creditors). There is demand for professional services of lawyers and accountants, but to the extent to which it is prescribed by the legal framework for business operation.

[13] The literature on the SMEs sector identifies the general *awareness problem SME* (*Maskell i dr.; 1998*) the lack of *strategic awareness (Gibb, Scott; 1985)*, or correlation between the kind and volume of planning and performance of SMEs (*Matthews, Scott, 1995*).

[14] *Leburić, A., Krneta, M.,op. cit.*

- Knowledge and experience necessary to set up a successful business and ensure a socially satisfactory survival rate are often inadequate.

<li type="arrow">SMEs (at least those of them that recognize the importance of knowledge and skills) have no sufficient economic strength to obtain the necessary knowledge and skills on the market.

<li type="arrow">SMEs are oriented to a short-term comprehension of their operation, because they lack the necessary knowledge, skills, information and awareness of development strategy.

2.3. Development level of entrepreneurial infrastructure

Entrepreneurial infrastructure in Croatia is being developed concurrently with the development of the SMEs sector. As a whole it is an area of national interest on the level of the central government and the local government units. Entrepreneurial infrastructure in Croatia generally comprises:

- Provision of material preconditions for setting up an autonomous business by establishment of entrepreneurial zones,[15] incubators, and entrepreneurial centres;

<li type="arrow">Grants for development of entrepreneurship in target groups (youth, women, war veterans), development of cooperatives, financing of marketing activities, introduction of new technologies, new products, business networking;

<li type="arrow">Provision of financial resources for set up of businesses, or investment in development by subsidizing interest rate based on the trilateral contract,[16] and

<li type="arrow">Training of entrepreneurs, mostly by entrepreneurial centers, in the stage of preparation for establishment of the new business (start-up entrepreneurs).[17]

The value of total investment into development of entrepreneurial infrastructure in Croatia in 2005 was 161.6 million kunas. In 2006 it reached 202.8 million kunas or on average about 3 thousand kunas per each small or medium enterprise, excluding sole traders and cooperatives. Investment in terms of individual items of entrepreneurial infrastructure development is shown in the Table 1.[18]

---

[15] According to the data of Ministry for business, labor and entrepreneurship, financial support has been given to establishment of 270 entrepreneurial zones, on the area of 3810 ha, in which 1663 businesses operate employing more than 16.7 thousand of employees (www.mingorp.hr; 25.10.2006).

[16] This refers to the contracts between the Ministry of business, labor and entrepreneurship, local government units (counties, towns) and commercial banks (project called *LOCAL ENTREPRENEUR OF DEVELOPMENT).*

[17] Croatian Bank for Restructuring and Development is also involved in the processes of education and training as the government developmental and export bank by financing training of those entrepreneurs who apply for loans intended for start-ups as a special target grou

[18] *Ministry for business, labor and entrepreneurship; www.mingorp.hr; 25.10.2006.*

Table 1. Investment value and dynamics into entrepreneurial infrastructure development in Croatia (2005-2006) – in million kn

Item/year	2005.	2006.	Share (2006)
Training and education	42,9	39,8	20%
Subsidies & guarantees & grants	27,5	54,6	27%
Entrepreneurial zones	89,9	97,1	48%
Other	1,4	11,4	6%
Total	**161,7**	**202,9**	**100%**

In the total value of investments, the relative share of investment into organization and arrangement of entrepreneurial zones is 48%. Subsidizing of interest rates,[19] government guarantees and grants as forms of financial support to SMEs participate with more than one quarter of the total investment value.

Since 2001, total investments have been constantly increasing, which is shown in the Figure 2.[20]
Figure 2. Value and dynamics of investment into entrepreneurial zones

As shown in the Figure 2, in the period of 2001-2005, the value of total investments into entrepreneurial zones was increased by more than three times.

The value of investment in entrepreneurial zones in terms of individual counties shows that almost a quarter of total investments (70.9 million kunas of the total 297.4 million) refer to the investment in three counties: Varaždin, Osijek-Baranja and Međimurje. These counties have the most developed SME sector in comparson to other local government units in Croatia.

The predominant way of distribution of incentives for entrepreneurial infrastructure development is by public competition. Selection criteria are determined on the local government unit level, most frequently neglecting developmental documentation (strategy)

---

[19] Subsidizing of interest rates refers to provision of more favorable financial resources to credit capital assets and working assets in the SME sector in comparison to crediting offered by commercial banks.
[20] *www.mingorp.hr; 25.10.2006.*

which is either lacking or exists only formally without mechanisms to control development strategy implementation and performance.

In the current conditions it is very hard to determine the development level of entrepreneurial infrastructure in Croatia, particularly in terms of its harmonization with the development level of the SME sector, both in volume and form variety, including the segment referring to stimulation of socially responsible behavior of small and medium enterprises.[21] Such valuation is possible only if based on coherent empirical research of both the Croatian SME sector development level (taking into account not variety of entrepreneurial forms but their characteristics) and entrepreneurial infrastructure development level.

Finally, it is to be noted that investment into development of entrepreneurial infrastructure, even in the form of incentives, does not mean support to small business as social category. Establishment and development of autonomous business operation is based on the principles of business performance in relation to operational efficiency, increase of output volume, market, employment, export, etc.

3. CONCEPT OF CORPORATE SOCIAL RESPONSIBILITY

3.1. Concept and development

The concept of *Corporate Social Responsibility (CSR)*, as already stated, refers to the social responsibility of companies. It can be said that the concept implies company commitment to ethical behavior and contribution to economic development, demonstrating respect towards people, communities, societies and environment.[22] According to the European Commission[23] CSR is the way in which companies decide to contribute voluntarily to a better society and cleaner environment.

Social responsibility of business, which is another name for CSR, started to develop in the late Middle Ages,[24] when the growth of commerce enabled rich merchants to raise funds for orphanages, hospitals and schools.

In the mid 19th century, when companies became the moving force of development, first trusts were founded. They were especially important in American economy in the first half of the 20th century as they allowed solving of numerous social and developmental problems.

The Second World War brought economic advantage to the USA, and in American society community volunteering was developed as well as donation of non-monetary contributions for common purposes. What makes the essential difference between the American and European economy is the fact that in the American practice the non-profit sector is recognized

---

[21] For instance, according to the available data for the SME sector in the EU, about 8% of SMEs enjoy some form of government support (tax relieves, subsidies, free access to information, etc) if they participate in activities directed to social responsibility outside of the company. *European SMEs and social and environmental responsibility,* European Commission, p. 7.
[22] Korporativna društvena i socijalna odgovornost: Pitanje uzimanja ili davanja?, www.meritormedia.hr
[23] European Commission, (2001), Promoting a European framework for corporate social responsibility, Green Paper, Industrial relations and industrial change, Employment &social affairs, str. 5.
[24] Bežovan, G., (2002), Socijalna odgovornost gospodarstva i iskustva u Hrvatskoj, Revija za sociologiju, Hrvatsko sociološko društvo, Zagreb, No. 1-2.

as a substitute for the public sector, which makes government social welfare costs comparatively low. In European countries the tradition of government responsibility is deeply rooted, and social welfare costs are covered by tax revenues.

The globalization process during the eighties and the nineties of the 20th century brought about stimulation of social responsibility strategy in individual business entities. Thus it is estimated that in the mid-nineties the American business entities contributed $ 7 billion for public welfare purposes, in Japan such contribution amounted to $ 1.5 billion, while in Europe it was between $ 1.8 and 2 billion. Most of these funds were intended for education, and then some for social services, art and culture, housing, environment protection, and recreation.

The beginning of the 21st century shows an obvious trend of increasing social demand for a greater corporate social responsibility and environmental credibility. In this sense, companies are required to take an active part in improvement of not only communities in which they operate, but also global society and life quality. In these terms, the practice responsibility for employees, shareholders, owners, customers, suppliers, and communities in which they operate can have different names. In the USA such practice is called *corporate philanthropy*, in the British tradition it is described by the concept of *corporate citizenship*, because companies have the status of citizens and therefore must accept certain obligations for the community in which they operate, while in other European countries this is called *corporate social responsibility*.[25]

3.2. Importance of corporate social responsibility

Corporate behavior in compliance with the concept of social responsibility provides important benefits for the companies and for the wider social community. According to some researches the benefits from implementation of the social responsibility concept can be seen in:[26]

- Significant increase in sales,

- Increased ability to attract new customers or users,

- Reduction of operational costs,

- Motivated and committed workforce,

- Increased ability to attract talents,

- Increased productivity,

- Improved product or service quality.

---

[25] Bežovan, G., op. cit.
[26] Korporativna društvena i socijalna odgovornost: Pitanje uzimanja ili davanja?, www.meritormedia.hr

In order to obtain benefits for the company,[27] managers have to:[28]

🔸 Be sensitive to issues affecting the lives of people with whom they live and work,

🔸 Show understanding of social conditions which they could affect positively,

🔸 Consider the social effect of their financial and business decisions on a wide range of society members, shareholders, and environment,

🔸 Be aware not only of what their company produces but also in what way.

Nowadays it is obvious that financially more powerful companies are guided by the principle of strategic social investment into community infrastructure, therefore they invest in schools, childcare institutions, medical institutions, financing of additional healthcare, educational and social welfare projects. Doing that, company managers want to be included in such investment as it enhances their interest in the outcome of such venture. In principle, most companies have moved from social responsibility to corporate social innovation. They see needs of community as an opportunity to develop ideas and display new technologies, find new markets, and solve long-term business problems.

Besides the above mentioned economic dimension, social responsibility also has another facet related to the global operation of companies. Namely, the problems resulting from pollution, child labor, whole-day women labor, and unfairly low wages in paid for work carried out undeveloped countries have raised the public awareness in developed countries of the need to make multinational companies change the ways of their operation. Therefore multinationals are pressured to be ethical in their operation. The negative influence of multinational companies oriented to maximization of their profits and not to social responsibility was pointed out by Naomi Klein in her book *No logo*.[29]

3.3. Social responsibility in EU and Croatia

According to the European Commission Programme,[30] Europe continues to focus on the company social responsibility, but in the way which will provide society based on knowledge, sustainable economic growth, and stronger social cohesion. Such definition of company social responsibilities is affected by the following factors:[31]

🔸 New concerns and expectations of citizens, consumers, public institutions and investors in the context of globalization and great changes in industry,

🔸 Social criteria which increasingly affect investment decisions made by institutions and individuals both as consumers and investors.

---

[27] USA researches show that in selecting products of the same price and quality 78% of respondents decide to buy products of the corporations which donate for medical research, education, or similar projects. Consumers form their attitudes under public influence and buy more from those who contribute to public welfare. According to Brežovan, G., op. cit.

[28] Korporativna društvena i socijalna odgovornost: Pitanje uzimanja ili davanja?, www.meritormedia.hr

[29] Klein, N., (2002.), No logo, bez prostora, bez izbora, bez posla, bez logotipa, V.B.Z., Zagreb

[30] European Commission, (2001), op. cit., p. 4.

[31] Ibid, p. 5.

⊕ Rise of anxiety over business activities detrimental to environment,

⊕ Achievement of transparency of business activities through media and modern information and communication technologies.

In Croatia, which is a European country by its historical, geographical and cultural characteristics, there are unfortunately no significant researches on corporate social responsibility. Research into corporate social responsibility was carried out by Bežovan,[32] with a hypothesis that in Croatia there are significant donation potentials, financial and human, which in developed partner relationship with civil society organizations and government can be mobilized for public benefits.

Also, the author's working hypothesis was that in Croatian economy social responsibility for community problems, through donation and sponsorship, is not normally part of the corporate business policy. Furthermore, reasons for donation are not conscious, and donation procedure is not transparent. Companies do not know what they will obtain or what they could obtain in return if they developed a transparent donation procedure.

Dealing with corporate social responsibility this research was based on empirically untested fact on selective influence of politics on donation and sponsorship in the past decade. The conclusions of this research showed that economic and political instability in the last ten years did not favor promotion of corporate social responsibility in Croatia. In the privatization process of socially owned enterprises the concept of corporate social responsibility was marginal. Tax regulations were often changed regardless of evaluation of corporate responsibility to contribute to solutions of social problems, and donation for public welfare was not stimulated by these regulations.

The type of social state that is being developed in Croatia does not stimulate development of socially responsible business. Businesses pay high taxes and contributions for social and public needs and thus cannot strive to solve problems in society or community.

The government cannot help "suggesting" directly or indirectly where corporate donations should go, sometimes even exposing businesses to political pressure. It is really difficult for the government to recognize socially responsible companies as equal and reliable partners.

The research has shown that a comparatively small number of business entities is about to build socially responsible relationships in communities in which they operate. They cannot see what they can get in return for such investment and by how much their value can be increased by such practice.

The culture of corporate social responsibility in Croatia can be improved by globalization processes – by entrance of foreign companies and privatization of public services.

---

[32] Bežovan, G., op. cit.

4. SOME ASPECTS OF IMPLEMENTATION OF THE SOCIAL RESPONSIBILITY CONCEPT IN CROATIAN SMALL AND MEDIUM ENTERPRISES

The SME sector in Croatia, although increasing in number of businesses, is predominantly in the start-up stage of businesses, and mostly established as necessity-based entrepreneurship.

This entrepreneurship is based on the limited access to important resources, either in terms of knowledge and skills or finance. In such conditions small and medium enterprises often do not have any formulated conception of social responsibility either with reference to their own operation or to their environment. Expanding within the limits of micro-enterprise, small business in Croatia predominantly reflects the personal attitude of owner/managers not only in terms of its operation and environment but also in terms of social responsibility. Predominant short-term dimension of business operation and lack of long-term strategic development planning most frequently results in lack of rules and procedures within the enterprise and in relation to its environment, unless it is explicitly demanded by the legal framework of operation.

Development of entrepreneurial culture, the public image of SMEs and their inclusion into social activities (participation in the local community projects, donations, sponsorship, participation in sport activities and cultural events of the community, etc.) are developed to the extent to which SMEs primarily achieve satisfactory financial results.

The SME policy in relation to its environment is predominantly of *receptive* character. SMEs expect and demand support (relieves) from their environment (the state) as the crucial factor of operation, or survival. According to research results,[33] they deem their functioning poor or inefficient in the following areas:

- Safety at work (60%),

- Compliance with technical standards and regulations (55%),

- Customer protection (53%), and

- Environment protection (52%).

The first three attitudes can be identified as elements of internal dimension of social responsibility in SMEs. The fourth attitude refers to the external dimension of social responsibility. Responding to the direct question about their environment most entrepreneurs (66%), describe it as *clean and healthy*. About 23% of entrepreneurs describe it as *polluted* while 11% of them is not at all interested in environment. Since there is general correlation of personal attitudes and scale of values of owner/manager and the enterprise, it can be assumed that, in terms of environment protection, the owner's opinion is predominant, and not the attitude of enterprise.

Small and medium entrepreneurs are very skeptical with reference to development of entrepreneurial ulture in Croatia. Almost one third of them (29%) think that entrepreneurial culture in Croatia is nonexistent. Some of them (28%) believe that entrepreneurial culture will

---

[33]

be developed concurrently with the inclusion of Croatia in Euro-Atlantic integration and normative harmonization of the SME sector.

The predominantly *receptive* character of development policy in the SMEs is also shown in responses of entrepreneurs with reference to the development strategy of the SME sector. More than 40% of suggested changes refer to the tax system (especially tax relieves), financial system (lower price of capital), control system (reduction of unregistered work). About one quarter of entrepreneurs think that legal regulations related to the SME sector is insufficient, therefore they suggest: strengthening the rule-of-law, new legislation related to SMEs, introduction of efficient state administration, development of consulting function for the SME sector.

The attitudes of entrepreneurs suggest predominant short-term approach to the SME development, or solving of the problems which they routinely face in their operation. They also hint at the unordered condition of the entire economic system in which SMEs are expected to function orderly. On the other hand, entrepreneurs feel that unordered system and frequent changes present a threat to their survival. Consequently, it is difficult to expect long-term development planning of SMEs in such conditions.

5. CONCLUDING REMARKS

The SME sector in Croatia has been developing during the last fifteen years under very unstable social and political circumstances. Nowadays the sector accounts for an increasing number of business activities, a great influence on the GDP, employment and exports.

In spite of inadequate statistical references to small business (which would be at least partly similar to those in the EU) and few empirical researches in this sector, it is obvious that entrepreneurial population is for the most part in the start-up stage.

Knowledge and experience are most frequently recognized as a limiting resource, although entrepreneurs are more apt to declare financial means as such.

Small business is oriented to short-term operation. Lack of strategic planning skill is most frequently obvious.

The social responsibility concept in the SME sector is not formally defined either with reference to the internal operation segments or with reference to the environment. Social responsibility can be measured by the financial strength of the small and medium enterprise, but it mainly takes form of company presentation in its direct environment (sponsoring sport events and cultural events, participating in the local community projects, etc.). The fact is that donation and sponsorship are not part of entrepreneurs' business policy, and that there are no conscious reasons for donation. This can be said both for big and small entreprenurs, especially for the latter who most frequently demand government support. Big entrepreneurs generally donate funds for humanitarian purposes. In such cases they do not consider donation as an investment and do not follow it up as they would an investment. As in Croatia corporate social responsibility is still not seen as social investment, the starting hypothesis of this research that the concept of corporate social responsibility provides means for development of entrepreneurial infrastructure cannot be accepted. Namely, development of entrepreneurial

infrastructure is the government concern. This development takes place concurrently with the development of the SME sector and from year to year it is gaining importance.

Regardless of the increasing investment into entrepreneurial infrastructure, it is hard to associate its development level with the predominant profile of the small business sector and answer the question on the harmonization of their development level. It can only be pointed to the need for a coherent empirical research of the Croatian SME sector and of the entrepreneurial infrastructure development level.

In general, from the aspect of social responsibility of SMEs, it is considered important to develop awareness of the need for strategic planning, which will allow comprehension of business operation as a long-term, balanced and constantly growing activity. In that way preconditions will be created for inclusion of all the aspects of internal and external social responsibility in SMEs beyond the legal framework aimed at achievement of more efficient operation and a recognizable position of SMEs within the community.

In development of entrepreneurial infrastructure guided by the intention and contents of the *EU Green Paper,* it is important to use measures and activities enticing the socially responsible behavior in SMEs which will lead to recognition of direct and long-term effects of such behavior. Support measures can be implemented in education to raise awareness of social responsibility in SMEs, and also as tax relieves which can have a positive effect on responsible behavior of SMEs.

THEORIES OF THE FIRM RECONSIDERED – SURVEY OF GOALS OF THE FIRM IN COMPARATIVE CORPORATE GOVERNANCE SYSTEMS

Mirjana Kuljak, PhD
University of Montenegro, Faculty of Economics
J. Tomaševića 37, Podgorica, Montenegro
Phone: ++ 381 81 241 138; Fax: ++ 381 81 241 757
E-mail: mira@cg.yu

Key words: *Goals, Firm, Comparative governance systems,*
Theories of the firm

1. GOAL OF THE SURVEY

Since the aim of the survey[1] is to test various theories of the firm from the perspective of the goals of the firm in comparative corporate governance systems, we have tried to present a review of economic goals of the most successful companies in Great Britain, Germany and European Union. The emphasis of the survey is on testing different hypotheses and competing theories of the firm by empirical evidences collected through the answers of business people on the questions on their own behavior.

Although in defining the goals of the firm various theories of the firm take a hypothetical motivation of managers, the method of hypothetical motivation has a similar shortcoming to the method of questionnaire or interview, since the hypothetical motivation could be as unreliable as the expressed motivation. Nevertheless, it is more realistic to assume that motivation expressed in questionnaire is closer to the goals of the firm than the performance measures as defined by the law and practice of performance, depending on the requirements of macroeconomic policy, competition, industry structure, education and motivation of management and employees.

Comparing Mayer's (Deakin, Hughes, 1997, p. 152) argument that "actually, the roots of the long-lasting debate on the governance could be … attributed to the associations of this kind" (that performances of the firm in large depend on the kind of corporate governance), with the opposite argument of Shleifer and Vishny (1997) that institutional differences do not determine the definition of company goals, but the degree of the law protection of large shareholders stake, the goal of this empirical research is, first, to determine whether there are considerable differences between goals of the firms in Great Britain, Germany and European Union, second, to show possible explanation of the results of the survey – are they due to the institutional differences in corporate systems or there prevail general institutional similarities, and third, what would be the implications of the results to the two main differing concepts in

---

[1] The paper refers to the empirical part of the doctoral research, An *Analysis of Goals of the Firm in Comparative Corporate Governance Systems*, Kuljak, M., (2005), University of Montenegro, Faculty of Economics, Podgorica.

theories of the firm – the concept of bounded and the concept of unbounded rationality. In case that results show significant differences exist, that would mean, according to the Mayer's argument, that is due to the institutional differences between the two corporate systems and that different theories are appropriate for different systems, which further means that they could not be considered as general. On the contrary, if results show that no significant differences exist, an explanation should be search for in a wider variety of institutional characteristics (as Shleifer and Vishny explain), what would lead to the more universal character of the theories of the firm which are not refuted.

2. METHODOLOGY OF THE SURVEY

In order to compare the goals of the firm in comparative systems of corporate governance and to test the validity of theories of the firm from that perspective, this survey compares 300 most successful companies in Great Britain, Germany and European Union, a 100 per country. Companies from Great Britain and Germany are taken as ranked by *EU 15000 Largest Companies, 1998*, and EU registered most successful companies not belonging to any particular country were taken out from *The Times 1000,* 1998. 32 companies, out of 300, responded to questionnaires, which present a low response rate (10.66%). Survey had been pursued from January to March, 1999.

An instrument for data collection was structured questionnaire sent by post mail to the addresses of board of directors of selected firms (with the approval by Windham B. Hornby, who used the same questionnaire in a similar research in Scotland in 1993). In order to enable comparison with previous empirical works in the area, the questionnaire encompasses a number of questions from recent researches. As Hornby says (1995), use of post mail questionnaire has a long tradition in research on firm behaviour, beginning from Hall and Hitch in 1930, through Skinner, Shipley, Jobber and Hooley. Answers are statistically processed firstly in each sample group separately (Pearson coefficient - x^2), and then between the groups, by testing null hypotheses (ANOVA, *F - ratio*).

3. ANALYSIS OF THE RESULTS

3.1. Sample

Having in mind the research question, goal and research environment (the need to determine a sample in a very short period of time, in conditions when there is no control over the sample, and when there is no intention to determine a representative sample, with determined resources for research), the most suitable technique for the sample selection was 'sample as defined by researcher', particularly the type of sample which is 'suitable' for the research, meaning that there is no rule, since the selection depends on the research question and goal.

The research question of the work is defined as follows – what is validity of particular theories of the firm from the perspective of the goals of the firm in comparative corporate governance systems? Goals of the research are to test the validity of various theories of the firm from the perspective of the goals of the firm in comparative corporate governance systems.

Validity and understanding of data in such a research environment depend more on way data were collected and the analyzing skills i.e. on the logic behind the sample selection, than on the size of the sample. As far as this particular research is concerned, basic logic behind the sample selection is that there is very small variation among population under research, since we assume that the causes of the patterns of firms' behavior stem from the characteristics of particular systems of corporate governance.

Table 1 presents a sector distribution of the sample.

Table1. Sector distribution of the sample

Sector	Great Britain		Germany		EU	
	Number	Percentage	Number	Percentage	Number	Percentage
Services	4	36.4	2	28.5	7	50.0
Production	5	45.5	3	43.0	2	14.3
Extraction	0	0	0	0	1	7.1
No answer	2	18.2	2	28.5	4	28.6
Total	**11**	**100.0 %**	**7**	**100.0 %**	**14**	**100.0 %**

Sector distributions of samples are very similar in Great Britain and Germany (43-45% of firms operates in production sector); in Great Britain 36% of firms are in service sector and in Germany that percentage is 28.5%. Among EU registered firms 50% responses were received from firms in service sector. 'No answer' answer represent 18.2% of the firms from Great Britain, and approximately 28% of firms from Germany and EU, each.

Tables 2 and 3 show size of firms and degree of competition (market structure) under which they operate.

Table 2. Size of firms

Answer	Great Britain		Germany		EU	
	Number	Percentage	Number	Percentage	Number	Percentage
Less than 50	0	0.0	0	0.0	0	0.0
51 to 200	0	0.0	0	0.0	0	0.0
201 to 1000	1	9.1	0	0.0	1	7.1
1001 to 5000	0	0.0	0	0.0	2	14.3
More than 5000	10	90.9	7	100.0	11	78.6
Total	**11**	**100.0 %**	**7**	**100.0 %**	**14**	**100.0 %**

In each sample received responses come from the firms with more than 5000 employees, which makes the results more reliable, since the large firms are intersections of prevailing typical characteristics of corporate governance in particular systems.

Table 3. Degree of competition

Answer	Category	Great Britain		Germany		EU	
		Number	Percentage	Number	Percentage	Number	Percentage
1 to 4	Monopoly	0	0.0	0	0.0	2	14.3
5 to 10	Oligopoly	2	18.2	1	14.3	3	21.4
11 to 25	Monopolistic competition	1	9.1	0	0.0	1	7.1
More than 25	Competitive	8	72.7	6	85.7	8	57.1
Total		**11**	**100.0 %**	**7**	**100.0 %**	**14**	**100.0 %**

Degree of competition, or market structure of selected samples show that considerable greater number of firms in Great Britain and Germany (72-85%) operates in competitive environment, while this percentage in the European sample is 57%, with considerable percentage of firms operating under oligopoly conditions (21.4%), the same as in Great Britain (18.2%) and Germany (14.3%). Pure monopolistic market has been registered in 14.3% of European firms, while in Britain and Germany there are no such firms in the sample. Under monopolistic competition operates 9.1% of British and 7.1% of European firms, and in Germany the number in the sample is zero.

3.2. Goals of the firm

Tables 4.a and *4.b* show the results of analysis of goals of the firms (rank and average result of ranking). Respondents were asked to rank offered goals (1 = the most important goal, 8 = the least important goal), in short and long run (*Table 4.a*), and in economic recession and boom (*Table 4.b*).

Table 4.a. Short-term and long-term goals

	Great Britain				**Germany**				**EU**			
	Rank	Short -run	Rank	Long -run	Rank	Short -run	Rank	Long -run	Rank	Short -run	Rank	Long -run
Maximization of prospective profit	2	2.40	2	2.22	4	2.57	2	2.83	4	3.30	3	2.36
Maximization of sales revenues	5	4.00	6	4.56	6	3.57	7	4.67	6	4.67	6	4.40
Growth in company size and dominance	6	4.11	5	3.67	6	3.57	5	4.17	8	5.40	8	5.36
Target return on assets	3	2.89	4	3.13	2	2.29	3	3.50	3	2.50	4	2.82
Target market share	7	5.22	7	4.78	5	3.14	5	4.17	5	4.11	5	4.27
Keeping prices similar to those of competition	8	5.38	8	6.25	1	2.00	4	3.67	7	5.30	7	5.20
Table 4.a. Contd.												
Increase company value (share price)	4	3.00	3	2.33	3	2.43	1	2.67	2	2.27	2	2.17
Other	1	1.67	1	1.33	8	5.00	8	8.00	1	1.50	1	2.00

Taking into account that the answers under 'other' are not precisely defined, and that the respondents in British and EU samples don't accept any goal as the most important, we can rationalize that behaviour of firms in those samples indicate the emergence of goals not recognized as typical in the literature so far, representing no specific category. This means that there is an open area for future descriptive research, indicating what kind of goals some companies are pursuing.

It is obvious that German sample shows completely the opposite situation – the same category of goals, 'other', is at the last position when the importance of goals is concerned, what should logically mean that in German institutional environment there is no signs of existence of the same phenomena. In the sense, it can be assumed that between British and EU systems of corporate governance, from the one side, and German, from the other, there is a difference.

Further, comparing the other categories of goals, the results show that between British and EU systems there are similarities in the sense that between long-run and short-run ranking of goals there are very small differences, while in German sample this difference is more emphasized, but still asymmetrically distributed. In the same time, profit maximization is the most important goal in British system, both in short and long-run followed by increase of company value (share price) and targeted return on assets. In German system, keeping prices similar to the level of competition is the most important goal in a short-run, followed by targeted return on assets, and in the long-run these are increase of company value and maximization of prospective profit, respectively. In the European system the most important goal is increase of company value, both in short and long-run, followed by maximization of profit and targeted return on assets.

The results presented so far give reason to assume that differences between comparative systems are slight, giving no clear advantage to the neoclassical, nor to the managerial theories of the firm.

Table 4.b. Goals in recession and boom

	Great Britain				**Germany**				**EU**			
	Rank	Recession	Rank	Boom	Rank	Recession	Rank	Boom	Rank	Recession	Rank	Boom
Maximization of prospective profit	2	2.33	2	2.25	6	3.80	1	2.33	4	3.20	4	3.00
Maximization of sales revenues	3	3.13	4	3.25	7	4.00	4	3.40	6	5.00	6	4.44

Table 4.b. Contd.

Growth in company size and dominance	6	3.57	7	4.29	3	3.00	4	3.40	6	5.00	7	4.67
Target return on assets	5	3.29	5	3.71	2	2.57	7	3.67	2	2.33	3	2.00
Target market share	7	4.00	6	4.14	5	3.60	6	3.50	5	4.00	5	3.89
Keeping prices similar to those of competition	8	4.71	8	5.86	1	2.40	3	3.00	8	5.33	8	5.20
Increase company value (share price)	3	3.13	3	3.00	4	3.33	2	2.50	3	2.40	2	1.89
Other	1	1.50	1	1.50	8	8.00	8	8.00	1	1.00	1	1.00

When it comes to the ranking of goals in periods of recession and economic boom, the same difference is evident under category 'other' as in the previous case. Profit maximization is the most important in British system, in both recession and boom times, and in Germany only in economic boom. These results don't support the theory that in recession times firms are inclined toward profit maximization, as a survival condition, performing other goals in boom. Differences between goals of firms are more obvious in a German corporate system – in a recession priority is given to the keeping price levels similar to those of competition, while in boom, as we saw, it is profit maximization. There is one interesting similarity between the two systems – almost equal and relatively high ranking of share prices in both periods, indicating the similar importance of capital markets.

Table 5. Single most important goal

	Great Britain		Germany		EU	
	Number	**Percentage**	**Number**	**Percentage**	**Number**	**Percentage**
Maximization of sales revenues of company value (share price)	4	36.4	1	14.3	3	21.4
Maximization of sales revenues	1	9.1	0	0.0	0	0.0
Profit maximization	2	18.2	0	0.0	2	14.2
Target rate of return on asset	0	0.0	0	0.0	3	21.3
Target market share	0	0.0	0	0.0	1	7.1
Other	1	9.1	1	14.3	2	14.2
Multiple goals	3	27.3	5	71.4	3	21.4
Total	**11**	**100.0 %**	**7**	**100.0 %**	**14**	**100.0 %**

Further examination of a single importance of each goal (particularly profit maximization and share price) led to results shown in the *Table 5*. There is extreme similarity between British and European systems, where the increase in share price is recognized as a single most important goal (multiple goals having the same importance in European case, 21.4%), next to it are multiple goals, while in German system no single goal is of overriding importance (71.4% of companies assigned the same importance to multiple goals, simultaneously). These results are in a significant accordance with results in *Tables 4.a* and *4.b*, confirming the validity of neoclassical theory of the firm, but still in favour of managerial theories, contrary to the results of Shipley's research on British economy (1981 and 1983) and Hornby's on Scotland economy (1995).

As Hornby (1995) states, for the firm to be categorised as one maximising profit two criteria have to be met - (1) profit maximization should be on the top and (2) profit maximization should be a single most important goal. This survey has revealed no such a conditions in either of comparative corporate systems, showing they are similar in terms of managerial theories of the firm.

There is permanent discussion in a literature whether firms aim at maximizing or satisfying profits. *Tables 6 (a, b, c)* shows goals for each sample. While in a British sample 64% of firms claim their goal is profit maximization, in Germany and Europe satisfying profit (57% and 64%, respectively) is prevailing. The results support the argument that in a British corporate governance system ('outsider' system) profit maximization is of overriding importance, while in German system ('insider' system) firms are more inclined toward satisfying profits. Further, EU harmonizing system shows traits of 'insider' corporate system, similar to German one.

The results are similar to those of Hornby's research (1995, p. 37) on Scotland firms (51.9% being profit maximizing) and Shipley's on British firms (where 52.3% are profit maximizing).

Regarding theories of the firm, it means that for the 'outsider' corporate system more relevant are those theories which assume profit maximization, while for the 'insider' corporate system more relevant are theories assuming satisfying profit. But still, differences are not so obvious to eliminate other theories as irrelevant.

Table 6.a. Maximizing profit and company size – Great Britain

Profit	Size										Total	
	< 50		51-200		201-1000		1001-5000		> 5000

Total	-	-	-	-	1	100	1	100	12	100	14	100

Regarding relation stated in hypothesis 1 (*H1*), statistical test for each sample (*Pearson x^2* coefficient calculated: *p = 0.995; p = 0.900 and p = 0.995,* respectively) shows that there is no significant negative relation between company size and profit maximization, i.e. there is no evidence that profit is considerably less important as firm grows. This result contradicts to managerial theories of the firm, which state that profit maximization is less important as firm grows. Thus results are in line with the results of Hornby's research.

In order to test more explicitly the relation between ownership and control, from the one side, and profit maximization, from the other, in hypothesis 2 (*H2*) it is supposed that owner

controlled firms are more inclined toward profit maximization than managerial firms. Data for testing this relation are shown in *Tables 7 (a, b, c)*.

Since there is no consent in the literature on the definitions of owner and management controlled firms, and to enable a comparison of results, in this survey we use classification Hornby used in his research – a firm is regarded as managerially controlled if there is no single shareholder, or group of shareholders, who controls more than 20% of shares.

Table 7.a. Maximizing profit and ownership and control of most successful companies – Great Britain

	0-5		6-10		11-20		21-50		> 50		Unknown		Total

Other	8	66	1	100	-		-		-		-		9	65
Total	12	100	1	100	-		-		1	100	-		14	100

Results of the survey show that firms in each sample are very close to or completely belong to managerial type of control i.e. no single shareholder, or group of shareholders, controls more than 20% of company shares. This is different from the Hornby's results on Scotland firms, where 57,1% firms are under management control and 42.9% firms are owner controlled. As Hornby cites, Gammie showed, using definition given by Radice and Kamerschen, on the sample of 30 Scotish companies, that share of owner controlled companies is significantly over 50%. In addition, Hornby cited that the percentage of owner controlled firms in Britain is lower than in Scotland. The same is confirmed by the results of this survey, too.

Statistical test of th relation between owner controlled firms and profit maximization in each sample has not confirmed that owner controlled firms are more inclined toward profit maximization (*p = 0.995,* for each sample), which is quite logical in this survey, as managerially controlled firms are dominating. Further, within managerially controlled firms in each sample it is perpetually confirmed that profit maximization is not given a priority. Although these relations exist, the results are not statistically significant. Hornby came to the similar statistically insignificant results.

Hypothesis 3 (*H3*) concerns the relation between the type of control, on the one hand, and minimum profit constraint, on the other, meaning that it is more probable that managerially controlled firms operates under minimum profit constraint than owner controlled firms.

Results within each group are shown separately in *Tables 8.a., b.* and *c*.

Table 8.a. Ownership and control and minimum profit constraint – Great Britain

Minimum profit constraint	0-5		6-10		11-20		21-50		> 50		Unknown		Total	
	n	%	n	%	n	%	n	%	n	%	n	%	n	%

Table 8.c. Ownership and control and minimum profit constraint – Europe

Minimum profit constraint	0-5		6-10		11-20		21-50		>50		Unknown		Total	
	n	%	n	%	n	%	n	%	n	%	n	%	n	%
Exists	4	64	1	100	-		-		1	100	-	-	6	43
Not exists	7	36	-		-		-		-	-	1	100	8	57
Total	11	100	1	100	-		-		1	100	1	100	14	100

Since managerially controlled firms are dominating in each group, it makes sense to follow the stated relation only in its relation to managerially controlled firms. Despite there is no clear inclination of these firms toward minimum profit constraint, results show that there is neither statistically significant relation (*p = 0.995*, for each group) between managerially controlled firms and minimum profit constraints, too. Hornby's results show that owner controlled firms are more in line with minimum profit constraint than managerially controlled firms. Results of this survey are open to that possibility.

Finally, the aim of this survey has been to test three relations (given in related hypotheses *H4a*, *H4b* and *H4c*). First, that majority of firms ought not to take into account market

Company size
Figure 1. Relation between firms' size and full costs pricing

conditions, i.e. to determine prices on the basis of full costs. Second, in case of small firms, it is supposed that they mostly use less sophisticated pricing techniques ('cost-plus'), in a great degree ignoring demand factors. And thirdly, when it comes to the monopolistic firms, it is supposed that they significantly ignore demand factors and use 'cost-plus' pricing formula.

The data collected by this research didn't make it possible to statistically test above stated relations, the results are presented graphically in *Figures 1*. and *2*., for each group. According to size, firms are classified in three groups – small (less than 50 employees), medium (from 51 to1000 employees) and large (more than 1000 employees). The degree of competition has taken into account a number of competing firms in a basic industry – monopoly (no competing firms), oligopoly (from 1 to 4 competing firms), not competitive (from 5 to 25 firms) and competitive (more than 25 competitive firms).

When talking about percentage of firms that use full cost pricing (*Figure 1*.), it can be observed that in Great Britain that percentage is 18-20%, in large firms and in total number,

leading to the conclusion that other firms in the sample take into account market conditions, contrary to the relation supposed in hypothesis *H4a*. In a German sample there is evidence of supposed relation (71% of firms use method of full cost pricing). Similar behaviour show firms in the European sample, but in a slightly lesser degree, as do British firms (21-23% of firms don't use full costs method). In other words, this sample shows no supposed relation, too.

Degree of competition
Figure 2. Relation between degree of competition and full costs pricing

Relations stated in hypotheses *H4b* and *H4c* were not possible to test on the basis of collected data in samples, since there were no small firms, neither monopoly. But still, as it is presented in a *Figure 2.*, it can be observed that full costs pricing is less in use by British firms (18%, 14% and 25%, by total number of firms, competitive and uncompetitive conditions, respectively) and European firms (21% of total number of firms and 38% of firms in competitive conditions, 0 being for uncompetitive conditions).

4. TESTING HYPOTHESES

Hypotheses are defined as null hypotheses, since the aim of the work is to test various theories of the firm from the perspective of differences in firm behavior (goals of the firms) in comparative corporate governance systems. Within each sample hypotheses are relational, which is presented in a previous section where goals of the firm are discussed

Data for testing hypotheses *1*, *2* and *3* are given respectively in *Tables 6 (a, b, c)*, *7 (a, b, c)* and *8 (a, b, c)*, under previous heading of the work; for statistical calculation of variance, ANOVA, *F-ratio,* see Kuljak (2005, appendices). If probabilities are less or equal to *p = 0,05*,

that means that between surveyed groups exist considerable differences in behavior. Variances for hypotheses *H4a, H4b* and *H4c* were not possible to calculate on the basis of existing data, so the conclusions concerning these hypotheses are based on graphical presentation of results in *Figures 1* and *2*.

Hypothesis 1 is formulated as follows:

H1: Between comparative systems of corporate governance there is no difference in terms of goals of firms – profit maximization and size of firm are in negative relation. In other words, as firm grows in size it could be expected higher degree of separation between ownership and control, and inclination of managers to prefer more satisfying than maximizing behavior.

Statistical test found that there is no significant difference (*p = 0.524*), between surveyed groups, in terms of negative relation between profit maximization and size of firms, i.e. from *Tables 6* (*a, b, c*) it can be seen that satisfactory behavior is significantly important with firm size. Hypothesis 1 has not been refuted.

Hypothesis 2 defines behaviour of firms in following terms:

H2: Between comparative systems of corporate governance there is no difference in terms of goals of firms – firms that are owner controlled are more inclined toward profit maximization than managerially controlled firms.

Variance analysis showed the probability *p = 0.919*, meaning that there is no significant difference in firm behavior between surveyed samples, i.e. it is not confirmed that owner controlled firms are more inclined toward profit maximization, in each sample. Hypothesis 2 has not been refuted.

Hypothesis 3 defines behavior of firms as follows:

H3: Between comparative systems of corporate governance there is no difference in terms of goals of firms – it is more probable that minimum profit constraint is respected by managerially controlled than owner controlled firms.

Statistical test showed that there is no significant difference (*p = 0.726*) in firms behavior between surveyed groups, i.e. minimum profit constraint is more in use in managerially controlled firms. Hypothesis 3 has not been refuted.

In related hypotheses *H4a, H4b* and *H4c*, following relations are defined:

H4a: Between comparative systems of corporate governance there is no difference in terms of pricing – majority of firms pursue full cost pricing.

H4b: Between comparative systems of corporate governance there is no difference in terms of pricing techniques small firms pursue – small firms use less sophisticated pricing techniques.

H4c: Between comparative systems of corporate governance there is no difference in terms of pricing policy pursued by monopolies – monopolies tend more to use 'cost-plus' pricing formula, significantly ignoring demand factors.

Since collected data didn't make possible to perform variance analysis, *Figure 1* enable to see that relation stated in hypothesis *H4a* is considerably present in German sample, while it is not the case in British and European samples. Relation stated in hypotheses *H4b* and *H4c* were not possible to see from existing data, as *Figures 1* and *2* show. Therefore, hypotheses *H4 (a, b, c)* were not possible to test, though there are some indications that *H4a* could be refuted, i.e. that between surveyed groups could exist significant differences.

5. CONCLUSION

Results of the empirical survey show the following:

Ad H1: Between comparative systems of corporate governance there is no difference in terms of goals of firms – profit maximisation and size of firms are in negative relation, i.e. managers don't significantly prefer profit maximisation with firm size.

Ad H2: Between comparative systems of corporate governance there is no difference in terms of goals of firms – managerially controlled firms are less inclined toward profit maximization.

Ad H3: Between comparative systems of corporate governance there is no difference in terms of goals of managerially controlled firms – minimum profit constraint is more in use in managerially controlled firms.

Ad H4a, H4b and *H4c:* On the basis of collected data it was not possible to make statistical test of these hypotheses; but, as to the relation *H4a* it is evident from the graphic presentation that German firms considerably pursue full costs pricing, while it was not the case in Great Britain and Europe.

In sum, the survey showed that there were no significant differences between firm behaviour in comparative systems of corporate governance of Great Britain, Germany and Europe Union, supporting the arguments of managerial and behavioural theories of the firm.

Further, it appeared that managers were not extremely inclined toward profit maximisation, what additionally supports managerial and behavioural theories of the firm.

However, it should be kept in mind that large and managerially controlled firms dominate in the samples (as representative for contemporary corporate systems), and that the survey introduced constraints for the firm to be recognized as profit maximizing, they should simultaneously match two criteria – (1) profit maximisation to be its first priority, and (2) profit maximisation to be its single most important goal.

1. INTRODUCTION

"It's not hard to make decisions when you know what your values are."
(Roy Disney, Film writer, Producer)

Values are strategic lessons which are learned through the course of life and tend to be maintained and remain stable over time. The term "lessons" refers to the realization that one way of acting is better than its opposite in order to achieve the desired outcome. Throughout history values have sparkled interest of many researchers in various sciences. With staggering growth of companies, management researchers became interested in this topic as well. They came to realization that values have a profound effect on people's performance. Therefore, they started researching values and similar topics of high ranking people in enterprises, namely top managers. Over the last decade, a substantial number of surveys regarding values in society were carried out. However, studying values in the business context in Slovenia has been severely neglected. This study fills the gap by providing empirical findings. The priority in this paper is therefore given to the presentation of empirical results.

The purpose of this paper is to shed light on values and to provide results of an empirical study on values. We identify the contemporary personal values among currently leading managers of enterprises in Slovenia and students majoring in management with a goal to become managers some time in the future. Based on the review of the literature which shows the influence of values on managerial behavior and subsequently its impact on the success of enterprises the results of an empirical study carried out in Slovenia are presented. Personal values are evaluated on two samples: 1) on a sample of managers in the top positions in Slovenia's large and medium-sized enterprises as well as 2) on a sample of students. The paper contributes to the realization of the values that are typical of Slovene managers and their younger potential counterparts.

The structure of the paper follows its purpose. In the second chapter a definition of the main concepts is be provided, followed by the presentation of some conclusions of the studies on values in management. In the third chapter research problem and research questions are presented and subsequently the methodological part of the research is explained. In the fourth part of the paper, the characteristics of the two study samples are presented, followed by the presentation of the most important and least important values. Finally, differences between contemporary and potential future managers are assessed.

2. LITERATURE REVIEW

Managers are expected to accomplish the goals of enterprises which are set by owners. They create the conditions and environment that enables enterprises to survive. A crucial aspect of managing is recognizing the role and importance of others. Managers are well aware of the fact that the only way for results to be delivered and goals accomplished is with the help of people, employees of the company. They carry out organizational goals in an effective and efficient manner through four management functions (Daft, Marcic, 2004). In the process of planning, they select goals and discuss and decide upon ways to attain them. The second phase is organizing, where the tasks to be accomplished are distributed among employees. Responsibility for task accomplishment is assigned to each employee. In the third (crucial) phase of leading, manager must use influence and other sources of power so that employees start performing tasks. Managers or leaders must sparkle desire for accomplishment in employees and most importantly, they must guide an employee's motivation in direction of reaching the goal. It is important that they control for the intensity and direction of the employee's motivation (Lipičnik, 2004). Within the last function of the management process, i.e. controlling, manager must monitor activities and make corrections. Feed-forward instead of feedback control is called for in this last phase.

Values can be distinguished by different levels at which they operate. When people start working in an enterprise, they operate according to their personal values. These values play a crucial role in private life as well and guide the individual's behavior in different situations. Values are formed from past experience and interaction with others. However, personal values are also influenced by cultural values, i.e. the dominant beliefs common for a collective society (McShane, von Glinow, 2003).

Alas (et al, 2006) believes that if people believe in a company's purpose, they will change their individual behavior to serve that purpose. If they do not, they most probably suffer from cognitive dissonance. However, as values are a fixed concept and do not change rapidly, it is believed that employees who's values are not aligned with the company's values, will leave that particular company on their own, rather than assimilate in the sense of values. Terry Broderick, former president and CEO of Royal & SunAlliance USA, also believes that corporations need to be straightforward about what their values are and that potential employees have to adhere to them. If they however choose not to, they are not the right candidates for that particular company (Henle, 2006).

Values are acquired, not learned, through the processes of socialisation, that is in interaction with family and friends and also in organizations people either work in or belong to (Alas et al, 2006). Values which are internalized are assumed to be fairly fixed over time. A value system an individual has developed presents what is hoped for and expected, what is

forbidden and what required. Values are seen as a list of criteria by which behaviour is judged and consequences called upon (Oyserman, 2001). Human values are defined as characteristics of individuals that vary in importance and serve as guiding principles in the life of a person or a group (Kluckhohn, 1951). As "beliefs about desirable end states or behaviours that transcend specific situations, guide selection or evaluation of behaviour and events, and are ordered by relative importance", values are believed to play a crucial role in a manager's decision process. (Schwartz, Bilsky, 1987). Schwartz and Bilsky combined the views of various theorists to incorporate into the definition the five formal features of values most often written about. Therefore, values are concepts or beliefs, which pertain to desirable end states or behaviors, transcend specific situations, guide one's selection and evaluation of behavior and events, and are ordered by relative importance (Schwartz, 1992).

2.1. Values research among university students

Examining values of students in management is particularly interesting as their values give the information about behavior in school as well as serve as a possible predictor of behavior in the workplace after finishing their studies. Depending on values, some speculations can be made as to how a school can shape its programmes and courses so that consequently students will be keen on learning and motivated for individual as well as teamwork.

Student values have become of interest to various researchers particularly in the recent years. Aygun and Imamoglu (2002) for example studied values of students from different departments of one university and compared them to the values of adults. International comparisons of values of the same generation of students are also of interest among researchers, even though the number of existing studies is low. Rickman and Houston (2003) studied students' values in USA and United Kingdom and found some differences. Students in USA assigned greater importance to values of achievement, hedonism, self-direction, and stimulation in comparison with British students. Gender differences also appeared. Women from both countries assigned greater value priorities to values of benevolence, universalism, security, and subordination of self to others. They tend to be more collectivist oriented. Women and men did not differ on the more individualistic values, and, in fact, women placed greater importance on achievement than men did.

The exploratory study of values among students from Estonia and Finnland showed that students have different value priorities which in authors' view is due to different stages of institutional development the states are in. the study examines the dynamics of values in order to work out proposals for influencing the values of business students during their vocational adaptation stage at university (Alas et al, 2006). When compared to Estonians, the analysis showed that to Finns ethical, cultural and leadership values are more important. Nevertheless, they put less importance to personal and business values. At the time of the second study (in 2005), ten years after the first study, Estonian and Finnish students were much closer in what they valued.

Myyry and Halkema (2001) studied values of 138 students of three universities in Finland. They compared business, social science and technology students. The analysis showed that business students stood out on achievement values whereas social science students on universalism, benevolence and spirituality. Technology students most valued security. To business students, both male and female and male technology students power was, as expected, very important. However, technology females and social science females and males scored low on this value. It was expected that business students would show greater gender

differences than other groups for values of achievement and work. It turns out that this hypothesis is only true for the latter value.

Contrary to the above, a study of 139 graduates with different fields of study (i.e. business, art, social work and political science, divinity and chemistry of physics) carried out in the USA did not show major differences in value based on different study programmes (Kopelman, 2004). It has to be pointed out that in this research respondents (mainly Deans) gave their opinion as to what values possess master's students. They did not evaluate their own values however they did assess the values of another group through their own lenses and based on their own perception of the environment. The reason for relatively homogeneous answers in our view lies in the fact that the median age of the respondents was 54 years, which leads to the belief that value systems through the course of life tend to be shaped by gained experience and wisdom. It is however logical that undergraduate students, who are much younger are still in the process of consolidating their values.

The content of this paper focuses on students majoring in management. It is namely particularly interesting to find out what is that these students, which as a group are probably relatively homogeneous, value. In needs to be pointed out that even though values are a stable category it is to be expected that values of students will to certain extent differ from values of managers. The reasons for existing differences are to be found in factors such as age, knowledge, experience, wisdom, different environmental influences, possible changes in culture, etc.

This paper, however, tries to make a link between generations and compares values of managers on one hand and students with aspirations of becoming managers. Since similar studies have not been carried out in Slovenia (as there are also no articles in the available databases) comparisons are not possible. Therefore this is an exploratory study.

2.2. Values research in business

Whereas values were once considered by managers as being too soft to be included in the company's philosophy, they have now become a central part of organizational strategy (Dolan et al, 2006). More and more companies are putting in place a framework that they are a values-based organization. Top managers are becoming interested in examination of their own values as well as the identification of company's values. Managing therefore is about the processes, credibility and about a set of values that the managers hold everybody in the company accountable for. The manager of Citygroup, one of the largest public companies in the world, believes that values is going to be a key focus going forward and that he is going to devote more time to talking about values (Henle, 2006).

England (1967) argues that it is of crucial importance to study managers' values for the various reasons. Values affect managers' perception of situations they find themselves in and the way they define problems. Values influence managers' decision-making process and the solutions to the problems. Next, values have a significant effect on how managers perceive other individuals and groups of people they work with. Therefore, we can say that they impact the process of building and sustaining interpersonal relationships. From the point of view of an enterprise, values influence managers' perception of individual and organizational success. Consequently, values also play an important role in the process of achieving the selected goals and the methods chosen to fulfill them. It needs to be stressed that values are crucial also in determining what is and what is not considered to be ethical behavior. Values are seen

as the foundation of ethical behavior. Finally, personal values also affect the extent to which a manager will accept or withstand pressures and different goals within the enterprise.

Empirical studies have confirmed the connection between managers' values and success (Conner, Becker, 1975). More successful managers value dynamism and constant activity, whereas less successful managers express passive and static values (Hodgetts, 1994). The connection between values and the process of decision-making has been shown by Ryan, Watson, Williams (1981) and Conner, Becker (1975). We believe that values of top managers not only influence their own behavior and decision-making, they also have a strong impact on the behaving principles of their subordinates. By signalling their own values, managers play a vital part in shaping the organizational culture.

Managers of enterprises which are vitally important for any society are individuals whose values are of particular interest. Personal value systems are said to be a very important factor in understanding managerial behaviour (England, 1967). Sarros and Santora (2001) stress that personal values influence managerial actions and subsequently strongly impact the overall success of the company.

Rokeach and Ball-Rokeach (1989) argue that it is of extreme value to compare value systems between individuals, as well as groups and society. England (1967) has come to a conclusion that there is a general value pattern which is characteristic of American managers however there is a great deal of variation in value systems from one individual to another. England asserts that personal values operate at the level of corporate strategy and also at the level of day-to-day work. Personal value systems are said to influence the organization in direct as well as indirect manner. This process however works in both ways implying that personal value systems are influenced by organization life.

3. FRAME OF THE RESEARCH

In order to provide answers to questions concerning the values that managers and students possess, an empirical approach to the problem was needed. Due to lack of studies in the field of management information about managers' values in Slovenia is scarce and for this reason we want to fill this gap. The empirical research presented in this paper forms a part of a larger study. The aim of the paper is to highlight the importance of studying values. We examine personal values among top managers in large and medium-sized companies and university students in Slovenia. The main therefore research question refers to identification of values of Slovene managers and of business students. The reason behind choosing personal values is the fact that these values represent the foundation for understanding an individual's behavior. Also, the information on values of a population as specific as the one of business students is scarce. Second research question thus concerns the perceived differences between managers and students. Thereby, some information as to how homogeneous or heterogeneous both populations are will be provided. In the paper, we test the null hypothesis which says that there are no mean differences among the two studied groups.

The research approach in the empirical part is quantitative in its nature. The decision for such approach is founded on several reasons. Firstly, this study is primarily explorative and it seeks basic characteristics of managers' and students' values which can be measured in a questionnaire and subsequently analyzed statistically. Secondly, due to its characteristics, one

of the samples chosen is quite specific as far as empirical studying is concerned. Namely, managers rarely decide to participate in research and the response rate is extremely low in questionnaires sent by post let alone in structured interviews. Data were gathered by means of a questionnaire. Last but not least, the majority of academics researching this field tend to choose quantitative approach, which can, with the use of an identical instrument, ease comparisons. Qualitative approach on the other hand has its advantages. It gives the researcher a broader and deeper insight into values therefore it would be extremely useful to somehow manage to combine both methods.

3.1 Sampling and collection of data

The two samples together include 248 respondents. The decision for the samples is in accordance with the purpose of the paper. In the first sample both large and medium-sized enterprises are included as only those managers that lead relatively large corporations were of interest to us. Besides that, people that are in charge of small companies, entrepreneurs, are in fact very different than managers of larger companies and have different ambitions, vision and strategic objective. Their personal characteristics therefore tend to be quite different than those of managers. We used stratified sampling as we wanted to explore the potential existence of differences in value priorities among enterprises of different size. Within the two strata, we randomly chose 230 large and 270 medium-sized enterprises. The size of firms in Slovenia is statutorily defined and is based on three criteria.[1] It was suspected that there would be more interest for participating in the research in medium-sized enterprises. In selecting the firms, Chambers of Commerce (2005) database was used. Distribution of questionnaires began in November 2005. They were sent by post. This was done with the aim of getting as many respondents as possible. By mid January managers from 130 Slovene enterprises satisfactorily completed the questionnaire. Some of the questionnaires were excluded from further analysis, because they were either not completely filled in or they exhibited zero variance (for example selecting only 6s, 5s or 4s for all items).

The response rate is 26% which is a typical rate for surveys in which the questionnaires are sent via ordinary mail. However, this was a surprisingly good response rate regarding the position the respondents hold. Namely, a staggering 65% of respondents are CEOs (a presentation of the characteristics of the sample follows in the next chapter) therefore we can assess the response rate as good.

The second sample comprises students of the Faculty of Economics at the University of Ljubljana. It was decided that only students, specializing in business would be included. At the same time, only those students who attended to the course on Leadership were included in the survey. Students filled in a questionnaire while attending a lecture. Altogether we got 118 responses, accounting to approximately 70% of the students enrolled in the course. Both, students and managers were given the same questionnaire with the aim of comparing their value systems. The research itself was carried out in the period from February to April 2006 on the premises of the faculty.

---

[1] Small firms are those that meet at least two of the following three criteria: (a) average number of employees in the last year does not exceed 50; (b) sales in the last year do not exceed EUR 4.25 m; and (c) average assets in the last year do not exceed EUR 2.13 m. Medium-sized firms are those that are not small and meet at least two of the following three conditions: (a) average number of employees in the last year does not exceed 250; (b) sales in the last year do not exceed EUR 17 m; and (c) average assets in the last year do not exceed EUR 8.5 m. Firms that cannot be defined as small or medium-sized are large firms (Uradni list RS, 2001).

3.2 Measuring device

For the purpose of testing research hypothesis a questionnaire consisting of two parts was designed. With regard to demographic characteristics in the first part, respondents gave information about educational attainment, years of managerial experience, work experience and monthly payment. Characteristics of enterprises such as size, industry, capital structure, business success were also obtained. The second part of the questionnaire included a list of values regarding one's personal life. We used Musek Value Survey which consists of 55 items (i.e. values) which refer to different aspects of life. The value scale has been used in several studies in the last decade and has good psychometric characteristics. The value of Cronbach alpha coefficient for the scale is 0.95. We excluded some of the values from the original list as they are not of interest in our study of managers, and added new ones which were relevant to the study. The final list included 36 values from the original study and 20 newly added values, summing up to 56 values altogether. Examples of values we included are politeness, looking for a purpose in life, self-discipline, winning, risk-taking, sense for people. On the other hand, examples of excluded values concerned with private, intimate life are enjoying beauty, good sex life, good relation with partner, equality among nations.

Values in the questionnaire required that respondents rate the importance of a particular value in their life. Respondents were asked to choose between six answers (a six-point Likert scale was used), whereby the measurement scale varied from 1 (not important at all in my life) to 6 (extremely important in my life). Respondents were asked to state their own opinion about particular values so the view was, as in all value studies, subjective.

The null hypothesis assumes the equality of sample means, while the alternative hypothesis states that means are not equal. The hypothesis was tested using Independent Samples T-Test procedure in order to assess the differences between groups within the samples. When testing the hypothesis a significance level of $\alpha=0.05$ was taken into consideration.

4. RESULTS

4.1 Samples' characteristics

4.1.1. Managers' characteristics

There were 68% of males and 32% females participating in the study. Such proportion (i.e. a higher number of male respondents) was expected, since in Slovenia as well as in some other EU countries positions of the highest rank are generally occupied by men. The largest subgroup of respondents, or 38%, is aged between 40 and 49. Almost 60% of managers hold a university degree, which shows the importance of education in order to occupy the most responsible posts in the company. It is important to note the position held by the managers that decided to participate in the study. The majority of the respondents, a staggering 65%, were CEOs, almost 20% were members of the board, and 11% of respondents were managers of business units or sectors. This structure can be evaluated as very good. Usually highest ranked managers do not have time to fill questionnaires and tend to delegate this task to the lower levels of management. With this structure of the sample, we will be able to discuss the values of CEOs. 40% of managers had been occupying the present position for less than five years and altogether 505 between 5 and 15 years. Managers were asked to give an average

number of working hours per week. More than 60% of managers spent between 46 and 60 hours a week in the office.

As far as the characteristics of the enterprises are concerned, about 60% of the enterprises are large and the rest are medium-sized. This proportion can be evaluated as good, since it was expected that fewer large companies would participate due to lack of interest in qualitative studies. With regard to the industry, most enterprises perform in sales (i.e. 38%) and manufacturing (i.e. 36%). It stems from this, that the results can to some extent be generalized for the situation in Slovenia. Based on the ROE criteria, the results show that in 38% of the enterprises ROE falls between 0 and 5%, 25% of enterprises between 5% and 10%.

4.1.2. Students' characteristics

The sample of business students altogether comprises 118 respondents, of which approximately 30% are male and 70% are female. This ratio reflects the situation typical of business and social-science faculties. The majority of enrolled students are female, which is similar to data on enrollment in other EU countries. 35% of the students are 21 years old, 35% are 22 and 17% are 23 years of age. The remaining students' age ranges from 24 to 31. As the course on Leadership takes place in the third year of undergraduate studies, one would expect the majority of the students to be aged 21, however, the length of studies completion is usually longer due to extra curricular activities students have (the majority of their time is taken by working). Almost 70% of students have completed a 4-year high school (i.e. gimnasium), whereas the remaining 30% completed other secondary school programmes. 75% of students have aspirations to pursue graduate studies at some time in their future. Obviously, such a high percentage shows, that implementation of Bologna guidelines is suitable for the Faculty of economics as the demand is high. 40% of the students are currently working and studying. Nevertheless, a relatively high number, 60% of students, are at the point of the survey not working

Figure 1. Demographic characteristics of respondents

4.2 Presentation of results

4.2.1   Most important values for managers and students

Personal values have a strong influence on all walks of an individual's life. They strongly influence the way a person behaves not only in private life but also (and for this article even more important) at work. As Henle points out: "You have to have a set of values, and those values are personal. You cannot have one set of values in your personal life and another set in your business life. That just does not work" (Henle, 2006, p. 349).

Table 1 presents values with highest ranks for managers as one group as well as separately for males and females. Values are ranked according to descending means. Slovene managers perceive health as most important in their life. Managers obviously realize that there is a high probability of illnesses in this occupation, what has been proved by various studies. Second place is occupied by family happiness, which is rather surprising although it confirms past findings in Slovenia. It is difficult to maintain a balance between work and family life and managers have to make one of them, usually work, a priority. Slovene managers perceive work as extremely important, since the results show that the majority of managers spend between 45 and 60 hours a week at work.

Honesty is ranked as third most important value which is comparable to views of managers from other countries (for example Kouzes, Posner 2002). In order to be successful and to be able to lead people, a manager has demonstrate honesty. If honesty is characteristic of one's personality, then this person is honest in every aspect or field of life, be it family and friends or work and colleagues. This fact again points to the realization that Kouzes and Posner stress the importance of vision in life (both private and professional) and the Slovene example shows that vision is important. Specially, male managers believe that being visionary is crucial, therefore they give it the highest rank. As managers are perceived as people who do not want to be given orders, this explains why freedom is given substantial importance.

Table 1. Ten highest ranked values of Slovene managers

Rank	Group values	Mean	Male values	Mean	Female values	Mean
1	Health	5.15	Vision	5.22	Family happiness	5.21
2	Family happiness	5.12	Health	5.20	Knowing oneself	5.12
3	Honesty	5.09	Honesty	5.15	Health	5.05
4	Vision	5.06	Family happiness	5.07	Wisdom	5.00
5	Freedom	4.95	Freedom	5.02	Hope in the future	4.95
6	Wisdom	4.92	Continuous education	4.98	Honesty	4.93
7	Continuous education	4.92	Morality	4.94	Raising children	4.83
8	Knowing oneself	4.88	Wisdom	4.89	Fairness	4.83
9	Raising children	4.85	Professional success	4.88	Continuous education	4.81
10	Fairness	4.85	Raising children	4.86	Freedom	4.81

Source: Research data

As far as gender differences are concerned, as it stems from the table, there are four values by which managers differ substantially. Male managers put vision in the first place, whereas female managers do not perceive it as important. Vision for females is not among first ten values. Morality or ethical behavior in life in general as well as professional is a priority for male managers. Female managers on the other hand do not believe it is very important.

Another difference exists regarding success in occupation. It appears that women are not as interested in success in chosen profession as men are. Desire for professional success is expressed by men. It seems that men are in this regard more ambitious and are prepared to invest more time to achieve results at the workplace. Another value expressed more by women than by men is hope in the future. Women put this value in the fifth position, whereas men in the fifteenth position.

In their studies, American researchers documented that age, education, type of employment and socioeconomic status influence value preferences (Oyserman, 2001). It stems from this that value preferences within groups are relatively homogeneous. However, differences exist between groups of people having different demographic characteristics. The above research findings lead to the supposition that values of students will be somewhat different from values that are most important to managers. This would predominantly be due to age differences. Nevertheless, both groups could indeed show similarities as to what they value. The reason for such results could be, that students are influenced by the curriculum and contents learned in various courses. It is in those courses namely, that one learns the best practices, decision-making styles and even values typical of managers in Slovenia as well as abroad. The latter would imply that cultural differences influence values of managers in different countries.

Table 2 therefore shows what is valued in life by business students. The values shown below are valid only for business students and cannot be generalized without further investigation. We suppose that, as was previously shown by other studies (i.e. explained in the review of literature). For students the most important thing currently in their lives is friendship. This situation is typical for younger people. At the same time, another value with highest estimate is "knowing oneself". People in their early twenties tend to be in a period of self-searching in their life. They are at a point where important decisions are being made, particularly as far as their beginning of the career and identifying occupation that suits their capabilities, is concerned. Third place in values ranking is occupied by health. The importance of health for students is to a certain extent surprising as students usually do not talk of health and quite a few tend not to enjoy the fitness classes that are obligatory in the undergraduate studies. However some of them do engage in various types of physical activities in order to improve their stamina. In the fourth place among most important values is freedom. Freedom as one of the universal values is something younger people particularly strive for. The positioning of this particular value is therefore not surprising. Honesty and fairness also seem to be universal values as they are both highly recognized by students as well as managers. Social life is also very important for students, thus receiving relatively high estimates. This value is also closely connected with having good friends and constantly investing in and thus nurturing the relationships.

Table 2. Ten highest ranked values of Slovene students

Rank	Group values	Mean	Male values	Mean	Female values	Mean
1	Good friends	5.31	Knowing oneself	5.16	Good friends	5.38
2	Knowing oneself	5.31	Good friends	5.16	Knowing oneself	5.37
3	Health	5.19	Social life	5.14	Health	5.30
4	Freedom	5.08	Continuous education	4.97	Freedom	5.14
5	Loyalty	4.95	Freedom	4.95	Family happiness	5.09
6	Family happiness	4.92	Health	4.95	Free time	5.00
7	Honesty	4.92	Honesty	4.86	Loyalty	4.99
8	Social life	4.91	Loyalty	4.86	Honesty	4.95
9	Fairness	4.81	Morality	4.78	Professional success	4.88
10	Continuous education	4.81	Fairness	4.76	Fairness	4.84

Source: Research data

As far as gender differences in the students group are concerned it can be said, that social life is more important to male students. Perhaps this can be due to their greater engagement in networking and thereby gaining the much needed social capital. Continuous education is also perceived as more important to male students, as well as morality. Perhaps male students have engaged more in the process of life-long learning in order to maintain their competitiveness by improving their competences. Female students on the other hand value higher the happiness in family. Contrary to this value, important for personal life, women also put emphasis on professional life and success. More information regarding gender differences among business students is provided in one of the following subchapters.

4.2.2 Least important values for managers and students

The question, that still needs to be answered, is connected with the least important values among all given values. Table 3 presents values of managers. The lowest ranked value is political success. It was expected that managers would not rate it as important. Slovenia is currently in a period where society at large does not have respect for and confidence in politics (Rus, Toš, 2005). In the present study, where managers expressed their opinions about value, they frequently said that politics and politicians should not interfere with the business practice. They speak in favor of privatization of state-owned companies. The interesting result is the low importance managers assign to fame, admiration, and exceeding others. Managers are considered to be people who are motivated by achievements, who have a desire to exceed others, to climb the hierarchical level and compete with others. The results presented here seem to be the contrary.

Another thing worth consideration is individuality. Researches around Europe (European Value Survey) have shown, that today, when everyone is talking about importance of team work, people are actually becoming more and more individualistically oriented (Nordström, Ridderstråle, 2001, 2003). They have no trust in others, only in themselves. Slovenia similarly shows this pattern in the last decade. Slovenes are people who mainly rely on themselves. They are among the least trusting nationalities in EU (Malnar, Svetlik, 2004).

Table 3. Ten lowest ranked values of Slovene managers

Rank	Group values	Mean	Male values	Mean	Female values	Mean
47	Comfortable life	3.87	Patriotism	3.83	Authority	3.79
48	Modesty	3.80	Social life	3.81	Eminence in society	3.71
49	Patriotism	3.78	Enjoying art	3.80	Patriotism	3.67
50	Good food and drink	3.75	Comfortable life	3.73	Exceeding others	3.67
51	Equality	3.75	Equality	3.73	Risk-taking	3.64
52	Social life	3.68	Good food and drink	3.70	Modesty	3.60
53	Exceeding others	3.64	Exceeding others	3.63	Individuality	3.50
54	Individuality	3.38	Individuality	3.32	Social life	3.40
55	Fame and admiration	2.54	Fame and admiration	2.69	Fame and admiration	2.21
56	Political success	2.25	Political success	2.26	Political success	2.21

Source: Research data

From observing the data, it can be concluded that there are few differences between male and female managers. Men put less emphasis to art and culture and other hedonistic areas of life.

Women seem to be more risk-averse as they assign much less importance to authority, and eminence in society. They also perceive modesty as less important than do men.

As far as students are concerned, the lowest ranked values tend to be somewhat different from the managers' values. The values are presented in Table 4. The lowest ranked value is political success. This particular value was least important for managers as well. Students at this point in their life are absolutely not interested in politics. Many of them do not regularly follow the political situation in Slovenia and abroad. Fame and admiration is also of least importance to them, this being slightly in contrast with higher valuing of social life and friends. Love towards the state is also not important for students however it is much more important for managers. Hard work, order and discipline are values in which managers and students differ as well. As far as gender differences are concerned eminence in society and modesty are less important to men, whereas women put less importance to modesty, discipline and winning.

Table 4. Ten lowest ranked values of Slovene students

Rank	Group values	Mean	Male values	Mean	Female values	Mean
47	Good food and drink	3,86	Hard work	3.76	Risk-taking	3.89
48	Risk-taking	3,85	Risk-taking	3.76	Winning	3.88
49	Modesty	3,81	Eminence in society	3.73	Modesty	3.80
50	Order and discipline	3,65	Exceeding others	3.65	Order and discipline	3.60
51	Exceeding others	3,55	Individuality	3.62	Exceeding others	3.51
52	Hard work	3,49	Good food and drink	3.59	Love towards the state	3.38
53	Love towards the state	3,41	Love towards the state	3.46	Hard work	3.37
54	Enjoying art	3,27	Enjoying art	3.16	Enjoying art	3.32
55	Fame and admiration	2,75	Political success	2.57	Fame and admiration	2.85
56	Political success	2,62	Fame and admiration	2.51	Political success	2.64

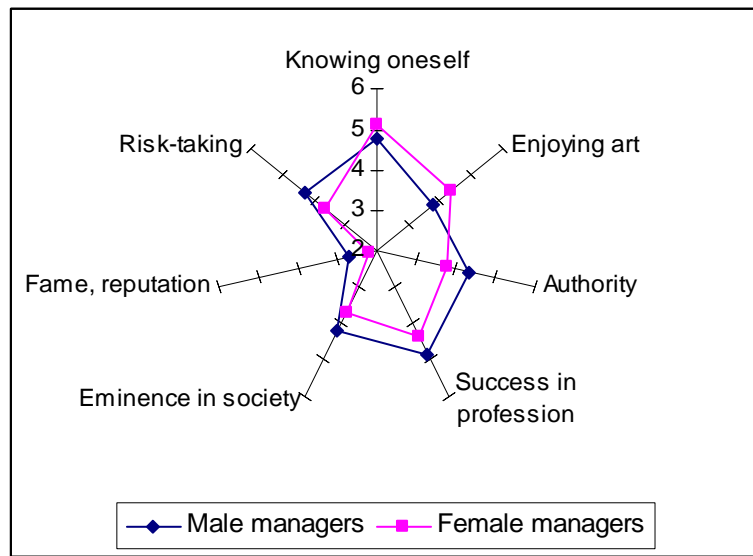
4.2.3. Assessment of differences within samples

The literature is still not united as to whether gender differences exist or not. Some empirical studies have come to conclusion that there are no differences, whereas other state that differences do exist (Prince-Gibson, Schwartz, 1998). Schwartz for example found that there were differences in all 47 national samples in his wide value project. According to his results men have higher priority for power and achievement values in comparison with, women whereas women perceive benevolence as more important than men.

Gender differences between male and female managers, as seen in Figure 2 are significant in seven cases. In other words, it can be concluded that male and female managers have relatively similar general values. Women perceive as more important values knowing oneself (p=.028), and enjoying art (p=.006), whereas men put more emphasis on authority (p=.002), success in profession (p=.009), eminence in society (p=.035), fame and reputation (p=.029). Men are also risk-takers (p=.008).


Source: Research data

Figure 2. Assessment of gender differences among managers

Gender differences are also significant among male and female business students, as seen in Figure 3. In other words, it can be concluded that male and female managers have relatively similar general values. 5 out of 6 values are perceived to be more important for female students. Women perceive as more important values free time (p=.002), family happiness (p=.029), cohabitation among people (p=.036), security (p=.017) and rest (p=.005). However, creative achievements are more value by men (p=.029).

Figure 3. Assessment of gender differences among students

4.2.4. Perceived differences between contemporary and future managers

This subchapter provides answers to the last research question which refers to the examination of differences between managers and students. The rankings of values presented in previous subchapters have already shown that there are differences in rankings of values between managers and students. Other studies which have been carried out in the past have shown that age does have a great influence on values. Younger people tend to put more emphasis on social life, acquaintances and friends. They are also more attracted to hedonistic areas of life, such as enjoyment, rest, etc. Figure 4 presents the differences in perceived importance of values between managers and students. Only those values are presented where a statistically significant difference has been proved. There are some other values where significance level is slightly above the permitted p value. With a greater sample perhaps these values would also statistically divide the samples.

Students in the present study perceive free time and friends as more important. This gives them the opportunity to get to know themselves better. Social life is to students also more important. It is interesting however that managers, who are said to be people oriented, and in fact need to be extrovert in order to lead others, do not see social life as important in their life. Students on the other hand, do get information about the importance of networking almost on a daily basis on the faculty. Managers, who live "the new economy" do not seem to care about it as much. Comfortable life and constant entertainment is also highly valued by students in comparison with managers. Being different, innovative and not conformed with rules at times is also more valued by students. This result probably reflects the fact that creativity and non-conformism are characteristics that are sought by companies' HR managers in job advertisements as well as interviews. Even though it received a mean value above three there are still more important values for both, managers and students. Surprisingly, loyalty is of more value to students than managers. If loyalty is an individual's value, than decisions in private as well as in professional life are made in accordance with it. Finally, students are keen on equality among people, which to a certain extent is not in coherence with individuality.

To managers, hard work, order and discipline are of premium importance, a situation that has been proved by past studies. Hard work is a value typical of middle-aged and old managers. Vision is a value that managers, if they want to be successful, need to demonstrate on a daily basis. In Slovenian case, vision is among most important values. Students however at this point in their life live other values. Obeying laws is also very important and this value has been given great attention particularly in the last years, after the emergence of many corporate scandals. Wisdom and the enjoyment of art as well as love towards the state are the representatives of universal values typical of people with a substantial quantity of experience. Finally, managers value the upbringing of children and sharing with them their own experience.

5. CONCLUDING REMARKS

Values are not actions, they are codes which underlie the sanctions or punishments for some choices of behavior and rewards for other. They have been extensively studied in various disciplines. Research of values in management began several decades ago and through the years its outcomes have become relevant not only to the academics but also to the business practitioners. Specifically in times of corporate scandals, downsizing practices, unethical decision making, which have all been filling newspaper pages during the last few years, the society becomes interested in the personality dimensions of CEOs. Specifically, people wonder what values are fundamental for those who lead companies, managers. Managerial values have a profound impact on individual work practices, relationships at work, shaping of the organizational culture, relationships with the exterior environment (business partners, suppliers, customers, government, society at large). It can be deduced that managers own a specific set of values.

The reasons for studying values on two samples in Slovenia are multifold. It has often been stressed in the public, that values in the Slovene society are changing and that they show a severe crisis. What is particularly interesting in the studying of values is their dynamic component. Even though a value represents a relatively stable category which tends to change over a longer period of time it is still subject to change. One example of this process is surely the different value orientations and priorities between generations.

The presented study included 130 male and female managers from companies operating in various industries in Slovenia as well as 118 business students. The nature of the study was exploratory, as it aimed to discover the values of managers. The subject of exploration was narrowed down to personal values related to various aspects of life. The statistical analysis shows that managers highly value health, family happiness, honesty, freedom and wisdom. This result seems to call for a balance between family and work life as managers devote a lot of time to work. Honesty is the third most important value and is as a personal characteristic a basis for good relations either at work or at home. Managers emphasize their professional life and strive for continuous education in order to be employable and competitive, wisdom, knowledge and hard work. They are self-disciplined and value achievements. Male managers above all emphasize the importance of vision, whereas women put the importance of family happiness above all. It can be concluded that managers in Slovenia are a rather homogeneous group and possess similar values. Among least valued areas of life are fame and admiration, political success, individuality and modesty. With the exception of political success, the results are rather surprising and some even contradictory. Therefore, further analysis will be needed to get a broader perspective of values.

The second sample, the sample of business students with the aspiration of becoming managers in the future, shows to an extent different results. Analysis on students' values shows that the most important values are good friends, knowing oneself, health, freedom, loyalty and family happiness. What students least value is political success, fame and admiration, enjoying art, love towards the state, hard work and exceeding others.

THE CHOICE OF THE CORPORATE GOVERNANCE MODEL AND ITS IMPLICATIONS FOR THE CORPORATE SOCIAL RESPONSIBILITY

Danijel Pučko

E-mail: danijel.pucko@ef.uni-lj.si

Key words: *corporate governance, governance model,
corporate social responsibility, one-tier corporate governance model,
two-tier corporate governance model*

1. INTRODUCTION

The Company Law that was passed in Slovenia in 1993 as an independent state introduced a corporate governance model that was quite similar to the model which was applied in (Western) Germany for a long time. Slovene companies used the enacted governance model afterwards for more than a decade. The results were not enthusiastic. T. Subotić assessed them with the following words: » … corporate governanance in many our companies do not achieve the governance level of the comparative companies in the European Union. Especially the profit and return on capital are far under the average level if compared with the companies in the developed members of the European Union« (Subotič, 5). One might speculate that they were among the main reasons for changes in the Slovenian Company Law in 2006 that opened up the possibility of choosing either Anglo-American or German corporate governance model in Slovenian corporate practice. The truth is that relevant changes in the legal system were made first of all because of the recommendations (requirements) accepted in Brussels.

The mentioned change in the legal framework confronted the owners of the companies with the question: »Should we substitute the existing corporate governance model, applied in our company, with the variant of the Anglo-American one or should we persist with the old (according to its characteristics mostly German governance) model?« An answer to the posed question is not at all simple. It cannot be generic, meaning that it cannot be obviously the same for all companies. Therefore it is worthwile to identify and analyse the factors that may have influence on the rational choice of the corporate governance model in each company. This is the subject matter of my research in this paper.

The chosen topic is analytically approached by using a comparative critical analysis of the two quite well known corporate governance models. A historical method of analysis is also used to identify the development of the corporate governance function as one of the most important organisational functions. After the definition of the research question, research purpose and cognitive goals, the overall research method and the structure of the paper are explained. In the second part the diversity of views on the essence of corporate governance is presented and the characteristics of the two main known corporate governance models described. Later on an analysis of the factors that support the choice of Anglo-American

model is carried out as well as a similar analysis of the supportive factors that are linked with the German model. How the concept of the corporate social responsibility could be implemented within each of the two models is the issue that is discussed in the fourth part of the paper. The conclusion summarizes the analytical findings and suggests the most probable developments in the corporate governance models in our environment.

2. DEVELOPMENT OF AND CONTEMPORARY CORPORATE GOVERNANCE MODELS

2.1. Historical development of the corporate governance function

The first enterprises in the human history were small economic units that were governed by individual owner. Their efficiency and effectiveness were dependent on the owner's rational decision-making. Enterprises were forced to grow if they wished to achieve a higher economic efficiency. Their size became in time too large for an individual owner to perform alone efficiently the governing and managing function in such enterprises. The decision-making process, because of its complexity, demanded capabilities that surpassed those of an individual. The business firm's owner was forced to employ professional leaders, who are called managers today and who were hired to assist the owner in managing the enterprise (Rozman, p.100). The originally uniform enterprise governing function was slowly divided into two organisational functions, namely governance and management. The enterprise's owner kept in his hands the competencies (rights) for making all those decisions that were important to promote his interests. Managers took over the management function, meaning the right and obligation to co-ordinate the enterprises's business process in the most efficient way with the purpose to assist the owner in achieving the objectives established by him. Managers became in this way owner's agents (trustees). They entered into a specific relationships with the owner which were the basis from which they derived their power for decision-making in an enterprise. Such a development opened the possibility that managers did not behave in the way which was the most prefered by the owner. The problem how much authonomy should the owner delegate to his managers became real. Economic theory knows this problem as the agent problem nowadays.

The further economic development drivers demanded such a size of enterprises that it was no more possible for an individual to provide all the needed capital. The solution was to pool the capital of more owners together. This innovation changed the governance function radically. Instead of one owner holding alone the governing function in his hands this function was allocated to more owners. The enterprise transformed itself into a partnership organisation and later into companies. A further dispersion of ownership shares in companies resulted in companies on shares with a very dispersed ownership. These changes contributed to an evolution of the governance function in enterprises. This function does not mean anymore a simple relationship between one owner and his managers. It became a complex set of relationships between many owners and their managers. Because of the complexity of those sets of relationships, they can be establish in many different ways. Here we find the ground for eraction of many different corporate governing models.

In spite of the (theoretical and practical) possibility that numerous different corporate governance models appear, it is fair to acknowledge that we know two main types of relationships in the field of corporate governance function. They are the Anglo-American and the German (Continental European) model. Each of the two (conceptual) models solves somehow differently the problem of power allocation (power for decision-making), decision-making efficiency and designing the corporate governing and managing function in an organisation.

As companies grew further, they became extremly large and complex organisations. The number of the owners of such organisations increased tremendously, too. Because of these developments individual owners were loosing their strong impact (power) on decision-making. The owners' dispersed ownership enabled the managers to gain additional decision-making power and concentrate in their hands the power that enabled them to neglect to a significant degree the owners' interests while managing the company. It would be wrong not to mention that the developments in external and internal companies' environment created the growing power of other stakeholders' groups in the companies too. The employees' co-determination phenomena in Europe very clearly indicates this fact.

2.2. Contemporary views on the essence of the corporate governing function

The theory of corporate governance as we call the phenomena of the governing of the companies today is not very well developed. Many different interpretations of its essence can be found (Turnbull, p. 181). Shleifer and Vishny define governance as the way in which suppliers of finance to companies assure themselves of getting a return on their investment (Shleifer & Vishny, p. 2). The definition is not comprehensive enough to include many companies' stakeholders. Collin and Cesljas define corporate governance as a system by which companies are directed and controlled (Collin & Cesljas, p. 164). Their definition is very general and not enough precise description of the phenomena. It does not emphasise the essential issues linked to solving the conflict of interest between two groups of actors, i. e. owners and managers, and the importance of the solution for efficiency of the company. The corporate governance, defined by OECD (Gregorič and Zajc, p. 263), as a set of mechanisms that regulate mutual relationships between those who dispose with the company's resources and those who actually contribute financial and non-financial means, seems to be more comprehensive and therefore better.

From the historical viewpoint the corporate governing function was developed as an organisational function (determined generally always by individual socio-economic system) that was a source of all the power in the enterprise and that, from the dynamic aspect, represents a process of establishing objectives and business policy as well as making all other important decisions which take care of the enterprise owners' interest (Lipovec, p. 52). Such a definition clearly suggests that this function encompasses socio-economic relationships that are of research interest for economics as a science and (internal) organisational relationships that are of research interest for organisational science. All those relationships can be created in many ways. It is difficult to say, that they could be formulated in an optimal way. The lawmaker has no possibility to define them as an optimal corporate governance system (Gregorič and Zajc, p. 267). It is pretty clear that the issue of a better or worse corporate governance model can be solved only (of course by taking into account the existing legal framework) for an individual company.

Corporate governance systems change in time and in individual countries. The corporate governance function did not carry its appropriate role in the developed corporate world in the last 30 years (Mac Avoy & Millstein, p. 9). The increasing number of individual owners, increasing share of institutional owners, decreasing power of individual investors, growing role of multinational companies, strategic alliances, networks, virtual organisations and enterprise clusters have contributed to such development. The stories of Enron, World Com, Vivendi, Parmalat and many others vividly show the problem.

Privatised previous state (social) enterprise in the European transitional countries experienced with many weaknesses of their corporate governance models too.The state and 'para-state' institutions, private investment funds, and internal owners dominate in many companies, while external investors do not have enough voting power to control the companies (Gregorič, et al., p. 184). The underdeveloped capital markets do nor provide a needed inflow of fresh capital into companies nor do their liquidity level offer an indirect owners' control over the behavior of management boards. The management boards mostly do not look for new fresh capital. They prefer to take care of maintaining the existing ownership's structure.

If we may talk about a corporate governance crisis today, then the relevant question is how one can come out of it.. The company has strived historically in its development to achieve one basic objective, i. e. performing in such a way that its profit and returns for the shareholders will be improved (Mac Avoy & Millstein, p. 11). More recent developments created the beliefs that also other company's stakeholders should participate in corporate governance together with the owners and control managers' decision-making as well as take part in making decisions regarding the profit allocation. The Continental Europe accepted this kind of beliefs more enthusiastically than the Anglo-American part of the world. In this regard we can say that so called stakeholders' concept linked to the corporate governance issue are getting support because of many reasons and recent developments. Will the way out of the corporate governance crisis be finally in the implementation of the stakeholders' concept? The answer to this question is not quite clear today. Many oppose to such a prediction by arguing that Anglo-American part of the world is achieving better overall economic results nowadays practicing a different corporate governance model. It could not be completely unbelievable that the corporate governance systems in the future will be more as some kind of the convergence of contemporary known systems.

2.3.   Two main corporate governance models in the world and their characteristics

We can find two extreme views on corporate governance systems today (Kuznetsov & Kuznetsov, p. 256). The neoclassical school considers that the company's owners (shareholders) are the sole group governing the company. On the other hand the corporate social responsibility school suggests to consider the company not exclusively as an entity that creates value for the shareholders, but as a coalition of primary stakeholders that should satisfy their interests. It means that today there are basically two different conceptual models of the corporate governance. These two models can be find under other names as well. Many authors speak about outsider and insider model of corporate governance. The major supporters of the first model can be found in USA and UK. The main supporters of the insiders model can be meet in Germany and other parts of Continental Europe as well as in Japan (Gregorič et al., 2000, p. 186). The first model appears also under the name Anglo- American or one-tier model, the second as a German or two-tiers model.

Both main corporate governance models include governing and management bodies or better to say sets of relationships between these to organisational functions (Poročilo o upravljanju javnih delniških družb 2006, p. 5). The shareholders' assembly and the board of directors are the governing bodies within the one-tier model. Members of the board of directors are external (i. e. persons that are not employed in the company) and internal. Internal members are executive directors – i. e. top managers of the company. The competencies and obligations of the board of directors are basically defined by the law in the relevant model, but the law does not forbid the board to delegate some of its competencies and obligations to executive directors. If the chief executive officer takes over at the same time the role of the chairman of the board of directors, then a very serious question appears whether the board of directors in this case can be still considered as a governing body or it is trasformed really in the main management board of the company. One-tier corporate governance model does not include any employees' participation in corporate governing function. Conflicts of interests between owners and managers might appear within this model very easily when executive directors concetrate too much power in their hands. The insider model is typical for the UK and USA, but later it was put into practice also in some other European countries (France, Swizerland, Italy, Sweden etc.). Macedonia introduced this model in its legal framework among the first European transitional countries (Drakuleski, p. 1133).

The basic characteristic of the two-tiers model are the stakeholders' assembly and the supervisory board as two governing bodies of the company. The law usually defines precisely the competencies and obligations of the supervisory board and forbids any transfer of these to the management bodies or individual managers. The highest managerial body in this model is the managing board which might consist of one or more managing directors. The supervisory board cof exclusively external members. The exemption to this rule are representatives of employees who are members of the supervisory boards in larger companies. The supervisors are elected by the shareholders. The employees' representative/s in the supervisory board is/are elected by the employees. The governing and the management function are clearly separated within the two-tiers corporate governance model. Some complexity and »multidirectional subordination« arise within the relationships because of the employees representative/s in the supervisory board. As supervisor/s he/they are supposed to control the managers, but as employee/s is/are suborninated to the managers. The two-tiers model is applied in Germany, Austria and Netherland. It was built into the legal systems of nearly all European transitional countries (for example Czech Republik, Estonia, Croatia, Latvia, Litvania, Hungary, Poland, Slovakia, Slovenia) at the beggining of their transition.

3. ANALYSIS OF FACTORS INFLUENCING THE CHOICE OF THE CORPORATE GOVERNANCE MODEL

Each one of the two main described corporate governance modelS has evolved on the ground of specific conditions in the companies' external environment. It could be said that each model is based on a set of assumptions which must be present in its environment. If the assumptions are not realistic, the model will not be efficient as expected. Its use will point out its different weaknesses. Let us therefore analyse both models from these two angles, i.e. their assumptions and potential weaknesses.

3.1. Factors supporting the choice of one-tier corporate governance model

The Anglo-American corporate governance model was developed on the classical theoretical economic assumptions: The company is governed directly by its owners or indirectly by the their chosen representatives. The governance fuction holds absolute power in the company. The company's purpose is creating a profit. The owners are the sole interest group in the company exposed to the risk of loss, therefore they are entitled to the whole profit created (after an appropriate tax on profit is paid). Other company's stakeholders do not take any risk of loss and therefore they can claim only payments in accordance with their productive contributions. Their services must be paid according to the contract. Because of this they can not require their participation in profit sharing. These assumptions are still valid in spite of the fact that the model was being trasformed in the companies with ever increasing dispersion of the ownership structure througout the twentieth century in the direction that means constantly higher integration of corporate governance and management function (Mac Avoy/ Millstein, p. 2).

In the one-tier corporate governance model the board of directors performs a control function, but it makes many (strategic) managerial decisions too. Executive directors, that are members of the board, hold in their hands the management function, at the same time they are supposed, in their role of being the members of the board of directors, to control the company's management. The outside members of the board of directors' relationship with the company's owners is much more simple and therefore clear. The inside members of the board relationships are on one hand supporting the company's owners who elected them as members of the board, but on the other hand their critical relationships are established and maintained with the board of directors as a collegial body which should supervise them in their role of company's managers. These two sets of relationships can be clearly distinquished here. The existence of such sets of relationships potentially offers the possibility that inside members of the board will not behave and act in best interest of the company's owners. The governance function as a process of protecting and promoting the company's owners interest has lost because of that at least partly its efficiency. Managers who are at the same time members of the board of directors might easily trasform their relationship of being owners' trustees into a relationship that wil not be based on the owners' interest in the forefront.

If the country's legal system at the same time allows that the Chief executive officer is a boards of directors chairman, then the danger that the managers's role of being the owners' trustee will be changed to something completely different is quite real. Such potential deformation in the relationship between owners and managers becomes still more probable if the legal system in a country allows the proxy mechanism to be used by managers regarding decision-making at the shareholders assembly.

The competencies of the board of directors in the one-tier corporate governance model are regularly larger if compared with those of the supervisory board in the two-tiers model. This fact diminishes a danger for deformations to appear in the relationship between the insider members of the board and the company's owners.

The competencies of the supervisory board are regularly precisely defined by the law. They encompass the choice of the managing board and the control of the company's financial performance as well as firing of the managing board's members. All other

businees decisions are in the hands of the company's managers. The top managers might consult the supervisory board but this is not obligatory.

In the one-tier model, apart from all the competencies mentioned for the supervisory board in the two-tier model, the board of directors as a body is also competent to make strategic decisions, while the operating decisions are expected to be made by executive directors only. This division of competencies between the board of directors and the company's management means a certain security device built in the model that protects the company's owners and does not allow executive directors to make any strategic decisions by themselves that would neglect the interests of the company's owners.

The described relationships between management and both governing bodies within the one-tier corporate governance model leave many possibilities for the conflict of interests to appear between two most powerful interest groups in the company. The danger of making decisions which are not in best interests of the company's owners is increasing if the level of integration of a governing and management function within the board of directors is higher.

Let us analyse the assumptions on which the one-tier corporate governance model is built and its potencial efficiency exepcted!

One –tier model has been developed for:

- a large independent corporation with a dispersed ownership structure,

- a well developed legal system that discourages ownership of banks and other financial organisations and protects well small shareholder,

- corporations situated in environments characterised by strong financial markets and small government intervention,

- an environment with the domination of competitive culture,

- the board of directors that is quite independent regarding its shareholders and stakeholders.

Existence of large independent companies with a dispersed ownership structure means that there aren't just a few big companies' groups in the economy with a wide network of subsidiaries whose business policies would be well coordinated from the parents' centers and consequently centainly diminish the competition. A high level of competition on the market forces the management teams to constantly strive for business performance improvements and company's growth.

If a dispersed ownership structure is one of the important assumption for the one-tier governance model introduction, then it is clear that individual shareholder has negleageble power. There are no (or there are rarely) shareholders who would have controlling shares in the company's ownership. Therefore such small owners need legal protection to be as efficient as possible. In such environments it is better if the use of proxy mechanisms are not allowed. Each small shareholder must be protected against making important decisions linked to large changes of the company's status and other radical changes without his needed participation.

Comprehensive and honest annual reports of the company's performance made and presented to the owners are urgently needed. The legal system must offer an efficient way for sueing members of the company's board of directors and top managers for their misbehaving and wrong doing. The usage of the »internal informations« for providing personal benefits must be qualified in the legal system as one of the greatest »sins« which could be efficiently penalised in the court procedures.

Shareholders have potentially a good indirect control over the behavior of company's management, if there exist strong capital markets in the country. Any dissatisfaction with the company's performance may always express by selling their shares on the very liquid capital market and by investing their capital in another venture. With an increasement of such »runaway« of the shareholders the share prices for that particular company will start to diminish. The final outcome will most probably be firing of the top management of the company. If in the country the capital market(s) is (are) weak (not very liquid), then the stated indirect owner's control over the company's management does not exist. It cannot be implemented in this way. Therefore shareholders' interest can be much more easily neglected by the management.

One-tier corporate governance model assumes that the government does not intervene strongly in corporate governance practice. If the government interferes in company's business decision-making, decisions will be based most probably on quite different criteria (first of all political instead of economic ones) than if there is no such intervention. If investors cannot be sure that the company will follow the objectives and goals that they consider as the right ones, they will not be willing to take over the risk linked to investing in such company.

Existence of a competitive culture in the environment is an important assumption for well-functioning of one-tier model. Competition is a mechanism that motivates managers to make decisions that improve the company's financial performance in the long run. If competitive environment exists managers have much less room for implementing their own group interests that would not be in accordance with interests of the company's owners interests.

Banks and similar financial organisations are economic entities that should not invest their capital into ownership shares in companies. If they behave otherwise they take over risks that are not typical of financial organisations. Their risk exposition would change radically by doing so. The monetary authority must intervene in such cases. Banks and other similar financial institutions dispose with large capital. If they enter the business firms' market, they are able to change quickly the company's ownership structure. It could be rapidly trasformed from a dispersed into a concetrated one. The assumption of a dispersed ownership ceases to be valid. Because of these reasons numerous countries forbid by law that financial organisations would be shareholders in companies (Collin/Cesljas, p. 163).

Well qualified and very independent ouside members of the boards od directors are needed in the one-tier corporate governance model. They must be able to take over the competencies for directing and controlling the company's performance. They have to take over the heavy responsibility for the board decisions towards the company's owners who elected them as well as towards other primary stakeholders. The board chairman should be ideally a strong personality and not an insider. He/she needs an excellent professional expertise that will enable him/her to establish his/her independent attitudes regarding important issues of the company operations and development. He/she must be in a position to provide the board members with the key relevant information. Such chairman must be able to put together the

agendas for the board meetings that will focus on company's strategic issues and that will force top managers to clarify their intended way of dealing with these issues. The chairman must be able to monitor and supervise the behavior and activities of the executive directors. All his/her tasks mentioned above will not be carried out appropriately if he/she is not able to dedicate himself/herself to an efficient performance of his/her role as a chairman. The logical consequence of all these requirements is that the chairman is well remunerated for his/her job. High professionality, personal reliability, dedication to the task and ability to establish independent attitudes must be needed traits of all other outside board members too if the one-tier model is expected to function well.

It is clear that in practice one-tier corporate governance model produces more or less good results. It shows even serious weaknesses in many cases. In some cases it contributes to the assessment that it is completely unsuitable. Then one starts to talk about the corporate governance crisis.

One-tier model weaknesses appear first of all because all its assumptions are not fullfilled and therefore the model does not function properly. Holes in the legal system could be the cause for development of serious deformations in companies' decision-making processes and for the damage done to shareholders. It happens frequently that the small shareholders are those whose interests are damaged the most. The Russian experiment with the introduction of one-tier corporate governance model in the begining of the transition (Kuznetsov/Kuznetsov, p. 249) might be a serious warning that the chosen governance model is not able to produce good results if the assumptions for its efficient functioning are not fullfilled.

One tier-model is the product of a liberal ideology. As such it is less suitable for the environments in the European transitional countries where such ideology is not present. Key assumptions for its efficient functioning are still not given in those economies. Their capital markets are still weak and unefficient. Shareholders are not in a position to exit from the company in an easy way. They are still not (especially the small ones) efficiently legally protected. There is not prevailing a competitive culture but some kind of a paternalistic one. Exploiting the insiders' information is still very much present and not appropriately legally sanctioned. Strong neformal links between politicians, top managers and the largest owners still exist. Banks are still important owners of many companies. Governments like to interfere in business decision-making. Auditing companies do not carry out very well their obligations regarding the provision of an honest and correct information on companies' performance.In some cases they even allow that managers not to disclose the real difficult company's situation. Managers that are active in previous socialist countries still behave in the way which was typical in the old system. They are very slow in their decision-making. Their orientation is rather short-sighted than long-sighted. They are still rather inflexible. They further maintain strong linkages with the local community. The managers' mobility is low and their mutual relationships strong. All these traits are not an appropriate ground for one-tier corporate governance model to function efficiently.

Serious weaknesses in the functioning of the one-tier model in the world practice can also be perceived because board members do not perform well their tasks. There are many outside board members that do not devote enough of their time to their supervisors' role. The board members' abilities to assess the company's environment, to analyse comprehensively the company, assess the critical human resource and political issues as well as the accounting practices in the companies are not all the time up to the level (Mac Avoy/Millstein, p. 3). The board members' remuneration is also not in accordance with job demands.

It would be too naive to expect that legal regulations could produce an efficient functioning of the one-tier corporate govenrnance model. On the contrary, the model is built on the assumption that legal framework enables those who hold the governance function in their hands to be as free as possible in establishing practical solutions for the their company's governing and management function. Such a concept opens up the posibilities for deformations in the perfomance of the governing function too. A large open space for deformations initiates the erection of different ethical and governing codes. Instead of diminishing unwanted behaviour they leave an open question of what positive efects might any such code have regardless of the level on which it is established.

3.2.   Factors supporting the two-tier corporate governnance model's choice

The German (two-tier) governance model is based on assumptions different from the Anglo-American one. Its most important assumptions are the following (Collin/Cesljas, p.167):

- Business group systems dominate in the economy.

- Financial markets are weak in the country.

- A government is used to intervene strongly in the economy.

- A rather co-operative or authoritarian culture prevails in the economy.

- Close connections are present between corporations and financial organisations.

- Company's owners are not the sole stakeholder group that takes over the business risk.

- More sizeable »governing aparatus« and wider participation in decision-making do not increase much the companies' costs.

The corporate governance function is carried out by two bodies in the two-tiers model. The shareholders' assembly is the first one and the supervisory board the second one. The top management body is a managing board. It may consist of just one person or of more managing directors. The employees' participation in company's governance and management is practiced in larger companies. The representatives of employees are members of the supervisory board in larger companies. An employees' director is the member of the top management if the company is large. Members of the supervisory board are elected by the shareholders' assembly (with the exemption of the representative/s of the employees in the board). The supervisory board nominates the members of the managing board. Members of the managing board and other top managers cannot be outsiders. The main task of the supervisory board is to nominate and to fire members of the managing board as well as to control the company's financial performance.

On the two-tiers corporate governance model there is a very clearly defined relationship between persons responsible for corporate governance on one hand and persons responsible for managing the company on the other hand. The governing bodies consider the company's managers as their agents that were selected and authorised to manage the company on behalf of the company's stakeholders. Therefore the supervisory board expects from the management to behave and act in the best interests of stakeholders. In a comparison with the

classical relationship between the company's owners and management the two-tiers model includes nowadays two main sets of relationships which are based on the existence of two interest groups, i. e. the company's owners on one side and employees on the other side. Other interest groups, like for example local community, suppliers, customers etc., are not directly included in the corporate governance within the German model. Their vital interests are dealt with legal regulations and by their own independent decision-making.

Existence of large business groups in the economy diminish a competition in a country. In such circumstances the one-tier governance model does not stimulate properly the company's management to focus on improving the company's financial performance and growth. Integration of the governance and management function in such environments might not produce the expected results. It seems to be a bad solution.

If capital markets are unefficient and weak then there are less opportunities for company's owners to perform an indirect control over managers. Owners have difficulties in selling their ownership shares in companies if they are not satisfy with the company's management. In such circumstances a more direct supervisory control of the company's management is needed.

If companies experience a stronger government intervention in business decision-making then owners need a more direct control over their company's management. It is clear that the government wants to have influence on the company's governance if its ownership share is not negligeable. Less clear are all those cases in which the government's influence and control are implemented in an indirect way in spite of the fact that the government has no stake in the company's ownership. Such influences might be implemented by carrying out its control through organisations like banks and other organisations whose cooperation is important for a company. Let us recall how French or Italian government behaved recently regarding the potential take-overs of some of the French or Italian business firms. It is not difficult to find similar examples in our region too.

If banks and other financial organisations hold larger ownership shares in companies, then they attempt to execute direct control over the companies performance. The supervisory board can carry out such a task more efficiently than the board of directors in which there is a mixture od representatives of owners and management.

G. J. March and M. R. Cyert began to develop a theory of the firm as a coalition of interest groups already far back in the sixties in the previous century by publishing their book A Behavioral Theory of the Firm (Mallory, p. 420). These two researchers initiated a new view on the enterprise as an organisation which should be governed by more interest groups and not just by company's owners. Here one might find important roots for the concept of the corporate social responsibility too.

The Anglo-American corporate government model cannot easily incorporate other interest groups into the company's governers. Therefore the phenomenon of the corporate social responsibility has got less supporters in the Anglo-American part of the world than in Europe. In principle, the German model allows easily to include besides employees as an interest group also any others as potentially eligible for carrying out the corporate governance function. By widening the interest base present in governing it seems that a company would be more efficiently directed towards paying approapriate attention to its social responsibility.

3.2.1 Corporate social responsibily and its implications for the corporate governance model

H. R. Bowen is considered to be the first who published a book on Social Responsibilities of the Businessman in 1953, not yet of a business firm (Carroll, p. 271). H. Johnson defined later a socially responsible firm as one whose managerial staff tries to balance a multiplicity of interests of different groups instead of striving only for maximisation of profits for its shareholders (Carroll, p. 273). He attempted really to integrate March's and Cyert's views on the firm with the concept of the corporate social responsibility. His socially responsible company takes into account other stakeholders too. G. A. Steiner explained the corporate social responsibility more as an attitude of the way a manager should approach his decision-making than a great shift in the economics of decision-maiking (Steiner, p. 164). M. Friedman completely rejected the concept already in the 1970 by stating: …»few trends could so throroughly undermine the very foundations of our free society as the acceptance by the corporate officials of a social responsibility other than to make as much money for their stockholders as possible« (Carroll, p. 277). D. Votaw warned us early that »the term corporate social responsibility is a brilliant one; it means something, but not always the same thing, to everybody« (Carroll, p. 279-280). This diversity of interpretations of the term still persists.

Alternative explanations of the corporate social responsibility which exist are as:

- just legal responsibilities of the company.

- a socially responsible behaviour in an ethical meaning.

- a responsibility for »something«.

- a responsibility for charity contributions.

- a social concious.

- legitimacy in the context of »belonging« or being proper or valid.

- something concerned with what economists term 'externalities', costs not absorbed in the product or service and not paid directly by the customer but taken over by the wider community (Finlay, p. 80).

- a concept that embraces four kinds of responsibilities: economic, legal, ethical and philantropic (Carroll, p. 280 and 289).

- a good management (Survey: Corporate Social Responsibility).

According to Carroll three themes or theories, related to corporate social responsibility, captured the most attention in the 1990s, namely corporate social performance, business ethics and stakeholder theory (Carroll, p. 290). In spite of the vivid discussion no theory has been yet developed that can provide a model of the corporate social responsibility nor is there any general agreement about the meaning of the term from an operational or managerial viewpoint (Clarkson, p. 92).

In spite of the existence of opposing views on the corporate social responsibility concept surveys of the companies' behavior show that companies are not rejecting it completely.

They include in their annual reports not just information on profit created but on their many other aspects of a socially responsible behavior too.But companies' social behavior reporting seems to be a little more than a cosmetic treatment. C. Crooke argues that this should not give cause for concern (Survey: Corporate Social Responsibility) because capitalism does not need the fundamental reform that many corporate social responsibility advocates wish for. He stipulates further: «If CSR (= corporate social responsibility) really were altering the bones behind the face of capitalism - … that would be bad: not just for the owners of capital, who collected the company's profits, but … also for society at large. Better that CSR be undertaken as a cosmetic exercise than as a serious surgery to fit what doesn't need fixing.«

Is a corporate social responsibility after all a worthwile concept? Which are the assumptions on which it is based? Could it be included in the mainstream economic theory without ruining it? It seems that such questions have no clear answer. The corporate social responsibility can be connected with the definition of a company which is not part of the classical economic theory. The new definition describes a company as a system of primary stakeholder groups, a complex set of relationships between and among interest groups with different rights, objectives, expectations, and responsibilities (Clarkson, p. 106-107). If a company is understood in such a way, then managers must manage all these sets of relationships and be responsible to all stakeholder groups.

A company as a system of stakeholder groups and sets of their relationships cannot be focud on just creation of wealth for only one stakeholder group, i.e. shareholders. The purpose of a company is in this context to create and distribute increased wealth and value to all its primary stakeholder groups, without favoring one group at the expense of others. Stakeholders are persons or groups that have, or claim, ownership, rights or interests in a company and its activities, past, present, or future (Clarckson, p. 106). A primary stakeholder group is one without whose continuing participation the company cannot survive as a going concern. The secondary stakeholders influence or affect, or are influenced or affected by the company but they are not essential for the company's survival. They are groups or organisations like governments, the inhabitants of the particualr geographical region, pressure groups etc.(Finlay, p. 80).

Managers must resolve conflicts between primary stakeholder groups otherwise they will not be able to retain the participation of a particular primary stakeholder group what might result in the company's inability to create and distribute sufficient wealth or value to satisfy one or more primary stakeholder groups. If one or more primary stakeholder groups cease to participate the company cannot survive.

Such theory of the business firm logically suggests that all primary stakeholder groups are entitled to govern the company. Primary stakeholder groups will take care of many aspects of the corporate social responsibility within this theoretical framework. Therefore the stakeholder approach to operationalisation of the corporate social responsibility might have a kind of firm foundation.

The problem is that the validity of the assumptions on which this definition of the busines firm is based is not proven yet.

*3.2.2 Practical experiences with the two-tier corporate governance model in the Central
European transitional countries*

The two-tier corporate governance model is inclined to build on the assumption that its
interest groups should govern a company. They can assert the appropriate company's social
responsibility. The owners are no longer the only risk-takers and investors in the company.
Due to a dispersed ownership, they do not take more risk than at least some other
stakeholders do. Employees invest in the circumstances of the evolving knowledge society
in developing some specific knowledge and/or skills which demand from them to take over
a significant risk that authorises them to participate in the governing of their companies.
The existing tendency of the increasing variable component of employees' renumeration,
which is apparent, requires risk sharing between owners and employees. In the
environments where a participation in corporate decision-making is acknowledged as an
important value because of different historical and cultural reasons this fact contributes
additionally to preffering a German governance model.

At the begining the Central European transitional countries chose in their legislation in the
majority of cases the two-tier governance model. Their choices were based on the
assessments that the assumptions for the efficient performance of the two-tier model in
those countries are better fulfilled than in the one-tier model. It is probably true that the
choices were not made primarily because of taking into account the increasing role of
employees' knowledge and specialised skills in their surrondings. The stated legal solutions
did not necessarily mean a wrong choice. In spite of that the adopted corporate governance
models did not produced very good results in the past years.

The German model (or any of its adaptation), which was introduced in the corporate
practice in the transitional countries of the Central Europe, produces besides acceptable
results also many weaknesses. Because the companies' ownership wide dispersion
managers were able to behave in the way which was frequently not in the best interest of
the comapnies' owners (Kozarzewski, p. 2061). The owners' and the employees' control
over managers were mostly weak and unefficient. Unexperienced and unqualified
supervisors contributed to such results. Supervisory boards were in the majority of cases
quite passive and not able to perform their role. Legal regulations were too modest which
contributed to »expropriations« of small shareholders by big ones (Pavlik, p. 114). The
Czeck case in this regard is well known. Governors were inclined to look for short-range
instead of long-range benefits. Owners were in the majority of cases not willing (or able) to
invest »fresh« capital in their companies. Perceived weaknesses were identified in
intertwining the management and ownership functions in companies which enabled the
managers (if they were among the bigger owners), because of holes in the legal
regulations, to use insider informations, proxy mechanisms for their best interests and the
low level of familiarity with the corporate control changes and their effects on the side of
other internal and external owners.

The implemented corporate governance model enabled the companies' management to
develope a paternalistic relationship towards its employees taking into account first of all
the need for maintaining workplaces at least in the short-run. Governments contributed to
such managerial behavior by enacting legal regulations that favoured keeping the
employment and by reducing lenders' risks. The protection of the owners' share in the
increased company's profit was not of the first importance. The implemented corporate
governance model surpported the managerial behavior directed to satisfy the needs of all

interest groups, i. e. in accordance with the paradigm of the company as a coalition of interest groups. Companies' owners interests were not in the forefront.

Distributive methods of the privatisation of previously state (social) enterprises could be a factor that made any neglect of the owners' interests relatively »acceptable and justified«. All these facts contributed to slower changes of organisational cultures than they would be experienced if one-tier corporate governance model would be implemented.

The overall result of the application of the two-tier governance models in the Central European transitional countries could be assessed in the way as T. Subotič made it. His assessment has already been stated in the Intoduction.

4. CONCLUSION

The corporate governance models provoke reconsideration everywhere today. Dissatisfaction with the corporate governance practice requires in searching for better solutions. There is no doubt that better models can be developed. But it would be wrong to expect that one corporate governance model might be the most suitable in all environments. Historical, cultural and economic as well as political factors are diferent in individual countries and even in individual industries. Their characteristics determine the most suitable governance model. Of course, different governance models have many common characteristics which are a basis for their classification.

Changes going on in the transitional part of Europe initiate reconsiderations about the corporate governance models that would be the most suitable for companies. The companies' ownership concentration process is present. Bigger business groups are evolving. The level of companies' independency is becoming lower. Governments are withdrawing (for the matter of fact too slowly) from the circle of companies' owners. Relevant legal regulations are improving. Individual European countries are introducing in their legal systems also the possibilities for companies to choose between one-tier or two-tier corporate governance model. The efficiency of the court system is expected to be improved. There are signals that capital markets will slowly improve their performace in the transitional countries. Banks do not seem to intend their fast withdrawl from the circle of companies' owners, but such a process is somehow present. It will take quite a time to be completed. Potential and existing supervisors are improving their professional knowledge and skills. They are taking their governing role and its responsibility more seriously. The structure of economic activities are not changing so quickly as in the first decade of transition, but slowly in the directions of strengthening of high-tech and knowledge-based industries. National cultures are not unchangeble, but the attitudes towards the role of competition and remuneration of managers are not trasforming more than slightly. It is difficult to perceive that individuals would be willing to take over bigger risk. Personal linkages and familiarities between bigger companies' owners, managerial and political elites are and will be a very strong factor of companies' financial performance.

All the stated changes and inertia force companies to reconsider which corporate governance model should be applied in the company in the future. The question that is

open today is: »Should we substitute our two-tier model with the one-tier corporate governance model?«

The answer to the posed question might be given by taking into account what is written in this article, by assessing the following determinants of the corporate governance model choice:

- What is the company's independecy level in the economy?

- How well is the relevant capital market developed?

- How well is the legal framework developed and how efficiently eventual conflict of interests among stakeholders can be settled by using a legal way?

- To what degree does government interfere with the business decision making?

- Is the level of rivarly in company's external environment high enough to force top managers to focus on icreasing the company's growth and financial performance?

- Do banks and other financial organisations have a significant influence on corporate governance function?

- Does the broad and narrow company's environment have a positive attitude towards competition as a way of solving economic problems?

- What are the professional quality, independency and efficiency of external company's auditing in the country?

- How easy is it to find higly qualified and well experienced persons that are able to build their independent position regarding their relationships towards different stakeholder groups and that are willing to dedicate needed time and energy to perform their tasks well for the outside members of the managing boards?

If the answers to the above stated questions are adequate (i.e. in accordance with the thesis suggested in this article), then the choice of the one-tier corporate governance model for the particular company might be a correct one. On the other hand, if we do assess that:

- The company operates in the industry in which a few business groups dominate and where a typical oligopolistic behavior prevails.

- The capital markets is weak.

- The legal framework is poorly developed and the efficiency of the legal enforcement is unsatisfied.

- The government's intervention into business decision-making is apparent.

- The banks and other financial organisations are still important owners of the companies.

- The paternalistic culture and participation in decision-making as an important value are strongly present.

- The company is situated in the high-tech or knowledgebased industry.

- An shortage of well qualified persons for the positions of supervisors in companies' managing boards exists,

- It should be concluded that it is better to keep a two-tier corporate governance model in that particular company and to try to improve its performance.

- The whole assessment procedure for choosing the right kind of the corporate governance model for a particular company might be carried out by using the tool described in the Table 1. A team should assess how well the individual assumptions (i.e. the assessment criteria in the Table 1) for the analysed governance model are fulfilled by asigning appropriate number of points to each criterium and by assessing the importance (weight) of each of the criteria.

- If the suitability of one-tier governance model was assessed in the Table 1, then the sum of weighted points (i. e. 2.20 what is less than average score) suggests that two-tier model is more appropriate in these circumstances.

Nowadays in many cases the one-tier corporate governance model might seem to be more efficient. If the importance of the employees' knowledge grows in the future, it might force in looking for a convergent governance model instead of a two-tier one. Employees might join owners as holders of the right to govern companies. Other primary and secondary stakeholders' groups will not be able to change radically their recent role regarding company's governance in foreseeable future too. They will be able to protect their interests good enough by taking part in the political processes that result in legal regulations of business firms operations. Of course they will try to implement their interests in other ways too. Different ethical codes of behavior are already in use in this regard and mean one way of influencing the companies' behavior. The question is how efficient they can be.

Table 1: Tool for assessing and choosing the right kind of the corporate governance model for a company

Assessment criterium	Point Assessment	Weight	Weighted Points
1. Company's degree of Independency	4	0.10	0.40
2. Capital market's efficiency	2	0.15	0.30
3. Level of legal regulations	2	0.10	0.20
4. Governement intervention	3	0.10	0.30
5. Banks as important owners	2	0.10	0.20
6. Attitude to competitivness	2	0.10	0.20
7. Importance of individuals' knowledge	2	0.15	0.30
8. Access to skillful supervisors	2	0.20	0.40
9. Total			2.20

Remark: Scale for the point asessment:

1 point = very low (very bad)
2 points = low (bad)
3 points = medium
4 points = high (good)
5 points = very high (very good)

Key words: *Ownership Structure, Evolution of Ownership, Firm Performance, Path Dependency*

1. INTRODUCTION

One of the questions attracting the attention of scholars of enterprise behaviour has been: why do we observe ownership concentration in some companies and dispersed ownership in others. There are great divergences in the pattern of ownership of firms in different countries around the world. The dispersed ownership pattern is predominant in the US and the UK while the concentrated ownership pattern is more common in Europe and developing countries. The differences in the legal framework between countries and path dependency are thought to explain different ownership structures around the world.

However, we also observe differences in ownership concentration within a country and also within the same industry. These differences in ownership structures and their impact on corporate performance have been and still are at the centre of a major economic debate. Empirical results on this issue reflects the complexity of the relationship between ownership and performance- with many of them predicting a positive relationship, others a negative or no relationship. In this paper we investigate this relationship, especially the evolution of ownership structure, path dependency and firm performance, for a sample of privatised firms in Albania.

The results of previous studies are closely related to the particular estimation method used. If ownership structure is treated as exogenous, the relationship is positive and significant. When ownership structure is treated as endogenous and dealt with through IV techniques, then the results change indicating no significant relationship between ownership and performance. But these results are unreliable because of the lack of information about instruments. Later, when panel data techniques were employed, the authors did not (or could not) adjust for heteroskedasticity and autocorrelation – and again ended up with inefficient estimators. Using the work of Baum, Schaffer and Stillman (2003) and the dynamic panel data modelling of

Arellano and Bond (1991) and Arellano and Bover (1995), this paper tries to deal with some of the problems of previous studies and generate more reliable and efficient empirical results. The paper is organised as follows: In the next section we discuss the theoretical and empirical literature on the relationship between ownership and performance in developed market economies. In section 3, we briefly examine the literature on countries in transition. Here we also discuss the main problems and shortcomings of different econometric techniques used in previous studies and also explain the advantages of using new GMM techniques. Our empirical results using several techniques are presented in section 4. In section 5 we provide some concluding remarks.

2. OWNERSHIP STRUCTURE AND FIRM PERFORMANCE

The debate on the relationship between ownership concentration and firm performance has a long history, going back to Berle and Means (1932). The separation of ownership and control, and the associated agency cost, implies that with the diffusion of ownership amongst a large number of shareholders, there will be greater opportunity for managerial discretion with self-seeking managers using their increased control to pursue self-interested policies. In developed market economies, however, there is a range of market-based mechanisms which aim at ensuring that managers do not engage in such policies. Given that these mechanisms may not operate effectively in some circumstances (e.g., in developing countries or countries with weak law enforcement), ownership concentration has developed as an alternative mechanism for ensuring that shareholders can exercise effective control over their firm. Ownership concentration makes effective shareholder monitoring feasible and prevents managerial expropriation (Shleifer and Vishny, 1986 and 1997).

While the above literature concentrates on the benefits of ownership concentration, the last few years have witnessed the emergence of a new literature highlighting the cost of this process. Ownership concentration results in reduced managerial initiative, lower market liquidity and increased opportunities for the expropriation of minority shareholders (Holmstrom and Tirole, 1993; Aghion and Tirole, 1997; Jensen and Smith, 2000; Burkart, et al., 1997; LaPorta et al. (1999); Burkart and Panunzi, 2001). This literature has led to the conclusion that shareholders may indeed benefit from the dispersion of share ownership and allowing the managers to engage in managerial initiative without the fear of interference by large shareholders. They would rely largely on the information from the stock market which would be more liquid, and produce more reliable information, in the absence of concentrated ownership.

The empirical work on the subject concentrated on the impact of ownership concentration (often managerial ownership concentration) on firm performance. Morck, et al. (1988), McConnell and Servaes (1990), Himmelberg, et al. (1999) and Holderness, et al. (1999), e.g., all found that ownership had a statistically significant, though non-monotonic, effect on firm performance. Generally their results show that there is a positive relationship between ownership concentration and performance at law and high levels of concentration and a negative relationship at the intermediate levels.[1]

---

[1] For example, Morck, et al. (1988) investigated the relationship between management ownership (combined shareholding of all board members with a minimum stake of 0.2 %) and the market valuation of the firm (measured by Tobin's Q). They investigated a sample of 371 Fortune 500 firms and found a non-monotonic relationship between managerial ownership and firm performance. Tobin's Q increases when managerial

In their seminal work of over twenty years ago, Demsetz and Lehn (1985) looked at the relationship between ownership concentration and firm performance from a completely new perspective. They argued that ownership concentration is the outcome of the optimising behaviour by shareholders and is influenced by firm, industry and environmental characteristics such as the firm's performance, the particularities of the industry, amenity potential, the benefits of control, the volatility of the environment, etc. For the first time, therefore, Demsetz and Lehn attempted to model and estimate the determinants of ownership concentration. Using a sample of 511 large U.S. firms, they showed that there was no systematic relationship between ownership concentration and firm performance, thus rejecting the idea that ownership concentration contributes to a better performance of firms.

The main contribution of Demsetz and Lehn (1985) to the debate was to highlight the endogeneity of ownership structure and how this and the firm performance were determined in the same process. However, despite raising the issue of endogeneity, they used OLS estimates to argue their case, ignoring the fact that OLS estimation would produce biased results in the presence of endogeneity. Indeed all the influential studies, referred to earlier, suffered from this problem.

Furthermore, although Demsetz and Lehn raised the issue of endogeneity, they did not include firm performance as an explanatory variable in the determination of ownership structure. It took another 16 years before Demsetz and Villalonga (2001) proposed to resolve the endogeneity problem by using the instrumental variable technique (or a two stage least square model, 2SLS) in the estimation process. By using a sub-sample of 223 firms from their 1985study, they investigated the relation between the ownership structure (the fraction of shares owned by the five largest shareholders as well as that owned by the management) and the performance of these companies, with ownership treated as an endogenous variable. They found that neither measures of ownership structure had a significant effect on firm performance, thus confirming their earlier results and pointing out that while diffused ownership may involve some agency problems, it also yields compensating advantages that offset such costs. Although the employment of 2SLS technique was a major innovation in the development of this debate, Demsetz and Villalonga's important study suffered from a number of important econometric problems that remained unresolved for a long time: the instruments were not identified, they were not theoretically justified, and there was no attempt to find out (or test) if these instruments were appropriate for the purpose.

3. OWNERSHIP STRUCTURE AND FIRM PERFORMANCE IN TRANSITION ECONOMIES

With the development of the transition process and the rapid evolution of ownership structure following the privatisation of formerly state owned companies, the scholars were presented with the opportunity not only to try to examine the impact of ownership concentration on firm

---

ownership is less than 5% or more than 25%. But the surprising result was the decrease of Tobin's Q when managerial ownership was between 5 and 25%. According to them managers' entrenchment or the non-value maximising behaviour of managers might be the reason for the decrease in Tobin's Q. Following the work by Morck, et al. (1988), McConnell and Servaes (1990) also studied the effect of insiders' (officers and directors) ownership on the Tobin's Q for a sample of 1,173 firms for 1976 and another sample of 1,093 firms for 1986. They also used the same technique as Morck, et al. (1988) and found that there is a non-linear relation between performance and insider ownership.

performance under the new transition conditions but also to study the evolution of ownership structure and factors influencing this evolution in transition countries. Claessens, et al. (1997) investigated a sample of 706 firms listed on the Prague Stock Exchange for the period 1992-1995. Using a Random Effect model they found that concentrated ownership (treated as exogenous) was significantly associated with higher performance (measured by Tobin's Q and profitability). A later study by Claessens and Djankov (1999), with a sample of 706 Czech firms, draws the same conclusion (also using a Random Effect model). They also tried to control for the endogeneity of ownership concentration (though not by means of a standard 2SLS procedure) and their results provided weak support for their previous findings, i.e., that ownership concentration positively and significantly affects performance.

Empirical studies relating to firms in the former Soviet Union show similar, though not as strong, results. Djankov (1999) examined the effect of ownership structure on enterprise restructuring (with labour productivity growth as one of the measures of restructuring) for 960 privatised manufacturing enterprises in six newly independent states (Georgia, Kazakhstan, the Kyrgyz Republic, Moldova, Russia and the Ukraine) over the 1995-1997 period. Using the OLS technique he found that ownership concentrated by foreign investors, at levels above 30% of total shares, was positively associated with labour productivity growth. The relation between managerial ownership and productivity growth was non-monotonic (positive at less than the 10% and above the 30% stakes and negative in the intermediate range). Similar results were obtained by Pivovarsky (2001) who investigated cross sectional data for 376 medium and large enterprises in the Ukraine in 1998. The results showed that ownership concentration (as measured by the shares of the top ten shareholders and the Herfindahl index) positively affected firm performance.

The dominant view that, because of the weakness of the legal framework and other corporate governance mechanisms, ownership concentration remains the only effective mechanism for alleviating the principal-agent problem has been questioned by a number of authors. Grosfeld and Tressel (2001), e.g., investigated the impact of ownership concentration on 200 non-financial companies in Poland over the period 1991-1998 (longer than most of the previous studies). Using the Generalised Method of Moments (GMM) (Arellano and Bond technique), they also found a U-shaped relationship between ownership concentration and firm performance- positive at low and high levels of concentration (less than 20% and more than 50% respectively) and negative at intermediate levels.[2] These results reflect the trade-off between managers' entrenchment and their incentive alignment. When the costs of ownership concentration exceed its benefits, it will have a negative effect on firm performance.

Kocenda and Valachy (2001), using a Random Effect technique, found that ownership concentration (measured by the share of the largest owner and the share of the largest five owners) had no significant impact on firm performance in a sample of 543 Czech firms over the 1996-1999 period. They acknowledged the endogeneity of ownership structure and the autocorrelation problem (of performance measures) and used the first difference of ownership indices and growth of performance measures to deal with these problems. However when Kocenda and Svejnar (2002) investigated a larger sample of 1,539 medium and large Czech firms for the same period, they obtained somewhat different results. The dispersed ownership (shown by a dummy variable indicating that no group of owners has 10% or more shares) has a higher positive effect on profit than either majority ownership (the largest owner having more than 50%), blocking minority ownership (the largest owner having between 33% and

---

[2] The results are similar to Djankov (1999) though the thresholds are different.

50%), or legal minority (the largest owner having between 10% and 33%). They also provide evidence that the effect of the single largest owner does not vary with the concentration of ownership.

The majority of studies undertaken for TEs are focused on the impact of ownership structure on firm performance. However, there are a number of other studies which investigate the evolution of ownership structure and its determinants including firm performance. Earle and Estrin (1997), Jones and Mygind (1999), Grosfeld and Hashi (2001) and Grosfeld and Hashi (2004) are examples of such studies. These studies use mainly panel data sets and probit/tobit or multinomial logit techniques and deal also with the hypothesis of path dependency of ownership structure. Their results on the impact of firm performance on ownership structure are mixed- no relationship, positive or negative relationship.

The majority of these studies continued to treat ownership structure and firm performance as exogenous, thus ignoring the principle established since Demsetz and Lehn. Most of the studies discussed here (except Claessens and Djankov, 1999[3]) do not address the endogeneity issue and therefore their results will be subject to endogeneity bias.[4] Those using panel data techniques (and therefore trying to take into account the time dimension of the process of concentration too) suffered from a different set of problems. Despite their important advantages, panel data techniques are also associated with a number of problems. As panel data involves both cross section and time series data, difficulties and problems may arise from dealing with both cross section characteristics (e.g., Heteroskedasticity) as well as time series characteristics (e.g., autocorrelation). If Heteroskedasticity and autocorrelation are present in the model, then the estimator is still consistent but no longer efficient which makes the inference difficult.

The essential point raised by the present paper is that the relationship between ownership concentration, firm performance and other firm and environmental characteristics, is strongly dependent on the empirical method used. If ownership structure is treated as exogenous, the relationship is positive and significant, though biased. When the endogeneity is dealt with through IV techniques, the results indicating no significant relationship between ownership and performance but, as there is never any information about instruments, these results are not reliable. When panel data technique was used, there was no mention of any adjustment for heteroskedasticity and autocorrelation, and the estimators were inefficient estimators.

The work by Baum, Schaffer and Stillman (2003) and the wider application of new econometric techniques (in particular dynamic panel data modelling) opened up new possibilities for the estimation of the relationship. Baum, et al. point out that the Generalised Methods of Moments (GMM) techniques are better alternatives for models with endogenous explanatory variables and heteroskedasticity and autocorrelation problems. GMM with Kernel based estimation and GMM with cluster-robust option produce heteroskedasticity and autocorrelation consistent (HAC) statistics which, according to Cushing and McGarvey (1999), are necessary for statistical inference and efficient parameter estimation. Furthermore, and more importantly, these procedures produce important diagnostic tests for the

---

[3] Claessens and Djankov (1999) deal with the endogeneity but not by a standard IV technique. They use a rather unknown two-step procedure: regressing the initial ownership concentration (immediately following voucher privatisation) on ownership concentration at the end of the period, and using the residuals of this regression in the main equation as a new measure of ownership concentration.
[4] Grosfeld and Hashi (2001 and 2004) raise the endogeneity issue but deal with it by regressing the concentration ratio in 1999 on the average value of a number of variables over the 1996-98 period.

instruments.[5] Both techniques produce the necessary diagnostics for testing the validity of the instruments used, i.e., the partial R-squared, the F-statistic of excluded instruments and the Hansen J-statistic. The partial R-squared shows the correlation between the excluded instruments (variables which do not appear in the second stage) and the endogenous variable in the first-stage regression, while the F-statistic can be used to test of the joint significance of excluded instruments. Bound, et al. (1995) suggest that both partial R-squared and F-statistic should be reported in any instrumental variable estimation as a 'useful guide' for the quality of this estimation process. The Hansen J-statistic, developed by Hansen (1982) as an extension of the Sargan test, is a test of over-identifying restrictions, i.e., whether the excluded instruments are exogenous and also correctly excluded from the regression. The rejection of the null hypothesis casts doubt on both model specification and the validity of the instruments (Hayashi, 2000; Baum, et al., 2003).[6]

The dynamic panel data models (or lagged dependent variable models) developed by Arellano and Bond (1991) and Arellano and Bover (1995) offer a new opportunity to estimate the ownership concentration-firm performance relationship while dealing with heteroskedasticity and autocorrelation problems as well as the appropriateness of the instruments. In these models, the lagged values or the lagged values of the first differences of endogenous variables are used as instruments. These are modern techniques which take into account the problem of autocorrelation by including dynamics (lagged values of the dependent variable) in the model. Including a lagged dependent variable in the model, according to Bond (2002), is necessary for the correct specification of the model. In other words, the omitted variables (dynamics in our case) may cause misspecification of the model. In addition, the inclusion of a dynamic element in the model is, of course, interesting also from the theoretical point of view as we can test if the ownership structure is path dependent. In other words, we can investigate if the previous ownership structure has any effect on ownership structure in subsequent periods.

4. EMPIRICAL WORK

In this paper we aim to estimate the evolution of ownership in a sample of privatised firms in Albania over a six year period, using a variety of estimation techniques, and demonstrate the sensitivity of the model to the choice of the estimation method.

4.1 The Data

The data used here was obtained by means of an enterprise survey carried out in 2003 in Albania. Initially we had aimed at surveying all 97 firms privatised in the mass privatisation programme (MPP) during 1996-97 period.[7] But we found that the number of surviving mass privatised firms was only 37.[8] Therefore, we decided to extend the survey and include

---

[5] Both GMM with kernel-based estimator and GMM with cluster robust option are available in the 'IVREG2' procedure (a user written programme) in the STATA package and can also be used with panel data.

[6] The GMM estimator, however, has poor small sample properties (Baum, et al., 2003). In such cases and if the error is homoskedastic the simple IV estimator is preferred vis-à-vis GMM. Furthermore, with small samples, it is difficult to find good instruments, in terms of complying with the required criteria. If the instruments are weak, then the estimator is biased in the same direction as the OLS and using GMM produces no better results.

[7] For details of the mass privatisation programme in Albania, see Hashi and Xhillari (1999).

[8] The rest of the firms had closed down, been destroyed, ceased operation or had split into parts with none of the parts working.

additional firms which had been privatised through other methods.[9] We succeeded in tracing some of these firms by working with local officials in several districts in Albania who provided us with the needed information on the new names of these firms and their current status. We succeeded in tracking down and collecting the relevant information for 12 additional firms (from seven administrative districts in Albania) which were willing to cooperate and give us the necessary information. The majority of them (9) were privatised before 1997 and the rest (3) after 1997.

4.2. The Model

On the basis of the empirical work by Demsetz and Lehn and others, we estimate the evolution of ownership structure on the basis of the following model:

$$\text{OWNCON}_{it} = \alpha + \beta_1 \text{PERF}_{it} + \beta_2 \text{OWNCON}_{i(t-1)} + \sum_{k=1}^{2} \eta_k DOM_{kit} + \sum_{j=1}^{m} \chi_j X_{jit} + \varepsilon_{it}$$

OWNCON_{it} stands for ownership concentration of firm i in year t, measured by (a) the share of the single largest owner (LC1), and (b) the share of the three largest owners (LC3).[10] PERF_{it} is the firm performance (labour productivity).[11] DOM_{it} are dummy variables which indicate the type of the dominant shareholder (two in our case, 'individuals' and 'other firms', with other smaller categories such as the management, employees and the state forming the base group), while X_{it} is a vector of other firm characteristics including size, capital intensity, the type of dominant owner, firm-specific risk, sector of origin, time elapsed since privatisation, method of privatisation, and corporate conflict.

The model is similar to that used in previous work on the subject[12], with the exception that we have included the lagged dependent variable on the right hand side (to introduce an element of dynamics and path dependency in the model). From the standpoint of the endogeneity discussion, the most relevant observable factor influencing ownership structure is firm performance. The type of dominant owner is also expected to influence ownership structure as different types of owners (state, individuals, other firms, managers, etc.) have different objectives and types of behaviour. As far as firm characteristics are concerned, we include the same variables as in other studies. Firm size is expected to be an important characteristic with influence on the owners' decision to hold larger or smaller stakes in a company. Larger firms have larger capital resources which imply a higher market value for a specific fraction of their ownership rights and, according to Demsetz and Lehn (1985) the 'potential cost' of holding shares in large firms will be lower with more diffuse ownership. Capital intensity is another factor which may influence ownership structure. Firms' investments in fixed capital

---

[9] Collecting information on these companies proved to be difficult too because, in Albania, there is no comprehensive list of the firms privatised through other methods in any government agency or ministry. The documents relating to the privatisation programme were destroyed during the civil unrest of September 1998 when a number of government buildings were set ablaze. Furthermore, the majority of companies privatised before 1997 were divided into the so-called "objects" and then privatised. Often, the part which had inherited the previous operating processes changed its name or operations immediately, or a few years after privatisation.
[10] Both measures of ownership concentration are bounded numbers, therefore following Demsetz and Lehn (1985), Demsetz and Villalonga (2001) and others, we have transformed the bounded number to an unbounded one by the following logarithmic transformation: LC1=ln[C1/(100-C1)], and similarly for LC3.
[11] We also examined the possibility of a lagged relationship (instead of levels) between ownership concentration and firm performance, but the results were largely the same in terms of sign, significance and size.
[12] The model is based on Demsetz and Villalonga (2001), Himmelberg, et al. (1999), Grosfeld and Hashi (2004) and Shehaj (2006).

(sometimes referred to as 'hard capital') are observable and easy to monitor. Thus, firms with a high proportion of fixed capital are generally expected to have a lower level of managerial ownership. Firm-specific risk is also thought to be a factor affecting the concentration of ownership. However, its impact on ownership concentration (positive or negative) depends on the existing structure of ownership and whether the firms under investigation are from established market economies or transition economies.

Sector specificity is another factor that may influence the ownership structure of firms because, given the nature of their activities including large size, large set-up costs and sector specific uncertainty, some sectors are more likely to have more dispersed ownership than others. In order to see if there is any difference between ownership structure of firms privatised earlier and those privatised later we use a variable to show the impact of the time elapsed since the firm was privatised. In order to check the importance of a conflictual environment in the firm on the ownership structure we have developed, and include, a 'corporate conflict index' (CCI) as a broad indicator of the level of conflict.[13]

4.3. Estimation Methods

We have estimated the above model using five different types of estimation methods. Initially, we estimate the model using a standard panel data technique, treating firm performance as an exogenous variable. Then we estimate the model by using the standard random effect IV technique where firm performance is treated as endogenous.[14] Next, we use the two GMM techniques discussed in the previous section, GMM with kernel based estimation and GMM with cluster robust option, where firm performance is treated as endogenous and instrumented. Finally, we use a dynamic panel data model (which is also a GMM technique), developed by Arellano and Bover (1995) which can estimate the equation in levels.[15] The results of the five estimation techniques are present in Table 1.[16] The precise meaning of the variables and their measurements are explained in Table 2 in the Appendix

At first glance, the five regressions seem to have produced some similar results in terms of significant and insignificant variables. In particular, the lagged value of the dependent variable is positive and highly significant showing that ownership concentration in our sample firms is path dependent irrespective of the estimation procedure used. In the last three regressions (all GMM techniques), the presence of dynamics explains much of the variation of the dependent variable, overshadowing other variables.[17] The sizes of the coefficients are, of course, different in different regressions - with the coefficients in the last three regressions

---

[13] The Corporate Conflict Index is constructed on the basis of the existence of a number of conflictual situations in a firm. The method of construction of the index is explained in the Appendix.

[14] The results of Fixed and Random Effect models are largely the same. But because the Fixed Effect model does not allow "time invariant" variables and also limits the number of instruments (because some instruments are time invariant) we decided to use the Random Effect model. Furthermore, as Wooldridge (2002) argues, the Fixed Effect estimates can be inaccurate if there are important variables in the model with low variation over time (such as dummy variables indicating the types of dominant owners and corporate conflict index).

[15] The other, related Arellano and Bond (1991) model was not used as it is based on first differences and therefore requires a larger time dimension.

[16] Because of the space limitation, the results with the share of the largest three shareholders (LC3) as the dependent variable are shown in Table 3 in the Appendix.

[17] The high concentration of ownership in countries like Albania is largely due to the weakness of other mechanisms of control and especially the legal and institutional environment. We did control for the impact of legal environment on the concentration of ownership by using a variety of EBRD indicators for Albania. However, the variable was not significant, we believe, because its value did not vary much during the period of analysis.

being 3 to 4 times larger than those of the first two regressions. When GMM techniques are used the results are largely the same in terms of size, significance and sign of coefficients.

Table 1: Determinants of ownership concentration (LC1$_t$)

Independent variables	Dependent variable: share of the largest owner (LC1$_t$)

Notes: t-statistics in parenthesis; * Significant at 10%; ** Significant at 5%; *** Significant at 1%. [a]M1 and M2 are tests for the first and second order autocorrelation of residuals.

In the first two estimation techniques (Random Effect and IV Random Effect) the results are very similar despite the fact that the first one treats performance as an exogenous variable. Apart from the lagged dependent variable there are a number of other significant variables such as the types of the dominant owners, capital intensity, years since privatisation,[18] method

---

[18] 'Years since privatisation' is the only control variable, apart from the lagged dependent variable, that remains significant even in the GMM techniques. We did use interaction terms between this variable and other control

of privatisation, the standard deviation of profits (a measure of the volatility of the firm's environment) and the Corporate Conflict Index. These variables have the expected sign.

However, the results of these two procedures are not reliable due to their serious shortcomings: the estimates are biased because of the use of an endogenous variable; statistics are not heteroskedasticity and autocorrelation consistent; and it is not possible to test the validity of instruments for the IV regression.

Moving on to the two GMM regressions in third and fourth columns, these options are clearly superior to the first two models as they have instrumented the endogenous variable. However, the diagnostics (Hansen J statistic) show that the instruments are not exogenous or there is a specification problem. Furthermore, the test of endogeneity indicates that $LC1_{t-1}$ is also endogenous (in addition to the performance variable) and should be instrumented in order to produce consistent results. However, this is not possible because, given our limited data set, finding appropriate additional instruments for a second endogenous variable is very difficult.

The problem of endogeneity of the lagged dependent variable can not be resolved by using these techniques. In such cases dynamic panel data models may offer a solution. The Arellano and Bover (1995) technique generates the instruments itself according to the users' specification of the variables that should be instrumented and the lagged limits. In the 'default' position this technique uses a relatively large number of instruments which sometimes (especially when more than one variable is to be instrumented) approaches the sample size. Using more instruments in the GMM techniques increases efficiency but, according to Arellano and Bover (1995), the excessive number of instruments (compared to the sample size) in finite samples may bias the results. In estimating this model, we used the options available to reduce the number of instruments.

The Hansen J-statistic, which tests the orthogonality of instruments, is not significant, showing that instruments are exogenous and the model is correctly specified. There are two other tests, M1 and M2, which test for the first and second order autocorrelation of residuals. Lagged values (or differences) of dependent variables are used as instruments and therefore if the residuals are autocorrelated the instruments used are not valid. Hence M1 and M2 also test the validity of instruments (Mangan, et al., 2005). In the first test (M1), the null hypothesis (that there is no first-order autocorrelation) should be rejected if first-order autocorrelation is present, thus justifying the use of dynamic panel data models. In order for the instruments to be valid, the null hypothesis in the second test (M2) (that there is no second order autocorrelation) should be accepted. The diagnostic tests in the table indicate that instruments are valid, even though M1 is only marginally significant which may question the use of dynamics. As mentioned previously, in finite samples the large number of instruments may generate biased results and the user should reduce this number as much as possible (in our estimation process, 21 instruments have been used). However, there is no diagnostic to test the redundancy of instruments (whether the instrument has increased the efficiency of estimates or not) and help the user to specify the right instruments. This is an area needing further improvement.

Overall, the use of the dynamic panel data model opens new possibilities for the investigation of the determinants of the ownership structure especially for firms in TEs. The relationship between lagged values and the dependent variable (ownership concentration) could be strong

---

variables in the model (firm performance, firm size capital intensity) but the results were similar to what is presented in Table 1.

in years after privatisation as we observe a significant evolution of ownership (in terms of concentration) of these firms 6 years after privatisation. However, the fact that both coefficients of lagged dependent variables in Table 1 are less than 1 (though close to 1), indicates that the model is stationary. In such models, according to Stewart (2005), the impact of a shock will be temporary. In other words this relationship may not be as strong (in terms of the size of coefficients) after 10 or more years as ownership of these firms and the markets in which they operate become more settled and stable.

The main difference between the models estimated in this section and those in previous studies is the use of the lagged dependent variable as an explanatory variable. The reason for its exclusion in previous studies has largely been the inability of researchers to deal with lagged dependent variable models. Although Arellano and Bond and Arellano and Bover developed their work in the last 10-15 years, this work is beginning to be used by applied economists only in recent years (e.g., Mangan, et al., 2005). As we have already pointed out this variable is significant in all the five regressions in Table 1 and therefore its elimination from previous studies is likely to have resulted in mis-specification of the model. If we exclude the lagged dependent variable from the estimations in Table 1, we would notice that: firstly, other variables become significant and, secondly, the overall explanatory power of these models is reduced (compare the R^2 statistics in Tables 1 and 4). These results are presented in Table 4 in the Appendix. Firm performance, e.g., becomes significant and positive in the second regression (IV Random Effect). Capital intensity (fixed assets to labour ratio), and/or its squared term, the privatisation method, and the corporate conflict index become significant in some or all of the regressions – as in previous studies. The essential point is that when econometric problems associated with previous studies are dealt with, and the model is specified properly, most of these variables become insignificant.

4.4. Sample Selection Bias

When the sample is not randomly drawn from a larger population, sample selection bias may arise. This means that standard estimators and tests may result in misleading inferences (Verbeek, 2000). In order to deal with non-responses or missing observations (which is an example of self-selection rule and a cause of selection bias) of different firms, we re-interviewed the firms in the sample until the missing observations were completed. However, according to Mátyás and Sevestre (1996), almost all samples based on interviewing micro-economic units suffer from some selection problems which are likely to be more serious in panel data.

There is a potential selection bias problem, discussed by Weiss and Nikitin (1998), concerning the relation between firm's performance and ownership composition. If during the privatisation process some types of owners were better informed than others about the performance of firms to be privatised, they would have been over represented in better performing firms. The majority of companies in our sample have been privatised through the Mass Privatisation Programme (MPP). During that process employees and ex-employees participated in the privatisation of more than 80% of companies. Indeed, in our sample employees are present as owners in 23 out of 45 companies, although they are dominant only in a few (3 firms in 1997). Also managers, who could have been better informed about the firms before the privatisation process, are dominant in only a small number of firms (4 in 1997).

Weiss and Nikitin (1998) proposed to use firm specific dummy variables or the initial ownership structure and changes in the firms' performance (instead of levels) in order to reduce the bias in estimated coefficients.[19] Given the small number of firms where employees and managers are dominant, we think that this particular selection bias is not a problem in our case. We did consider using the "growth", instead of the "level", of performance indicators but this reduced the number of observations with possible consequences for the robustness of the estimation process (because of reduced degrees of freedom).[20]

The firms in Albania had to meet certain criteria in order to be included in the MPP scheme: to be in operation, to have a good or reasonable financial performance, and not to be heavily indebted. However, not all firms that were privatised under the MPP scheme actually met these criteria. Financial problems, especially in the aftermath of the shock in 1997 made it difficult for many firms to survive regardless of their ownership structure. Some of them ceased production activities in order to use their facilities for more profitable purposes, again regardless of their ownership structure. We have to acknowledge the possibility of some selection bias as we are left with only 37 out of 97 mass privatised firms and are not able to explore the relationship between ownership structure and firm performance of firms that did not survive.

5. CONCLUDING REMARKS

The literature on the impact of ownership structure on firm performance in mature market economies has produced ambiguous results. This has been partly due to the recognition and inclusion of *benefits* as well as *costs* of ownership concentration and partly depending on whether or not ownership structure has been treated as an endogenous variable. In the context of TEs, in general, the literature seems to have been more conclusive. The absence (or weakness) of other mechanisms for corporate control seems to have left the primary monitoring role to ownership concentration. However, here, most studies have treated ownership structure as an exogenous factor in the investigation of its relation with firm performance. A number of studies have raised the issue of endogeneity and acknowledged its existence but have not dealt with it sufficiently. Some of these have used a 2SLS technique, and panel data sets, but still suffer from a number of shortcomings related to the validity of instruments and the treatment of heteroskedasticity and autocorrelation.

In this paper we investigate the evolution of ownership structure in a panel of privatised firms in Albania and demonstrate the role of the estimation technique used. In addition to the standard methodology using panel data techniques with or without the two stage least squares procedure, we use the more recently developed GMM techniques as well as the Arellano and Bover dynamic panel data technique to deal with endogeneity, heteroskedasticity and autocorrelation problems simultaneously. Another issue, which has not been received much attention in previous empirical studies, is the path dependency of ownership structure. This is especially important in TEs where institutions and legal protection of shareholders are weak and marked-based control mechanisms are not well developed. In this paper, we include a lagged dependent variable in the estimated regression.

---

[19] They argue that the better informed buyers of shares of a company, were better informed about the level of performance at that time, but had no information how this performance will change.
[20] The diagnostics of the regressions using changes were poor, most probably due to the reduced number of observations.

We provide sufficient evidence to support the view that the evolution of ownership structure in the Albanian privatised firms is path dependent irrespective of the estimation method used. For the sample under consideration, there is also no statistically significant relationship between ownership concentration and firm performance, thus confirming Demsetz and Lehn and Demsetz and Villalonga's results. For other explanatory variables, although there are several significant variables with standard techniques, their significance disappears when we use more robust techniques which deal with the econometric problems mentioned earlier.

APPENDIX

Corporate Conflict Index
The Corporate Conflict Index is constructed on the basis of the following 6 statements:

		1997-2000		2001-2002	
		1	0	1	0
1	The company has not paid dividends during the period.	Yes	No	Yes	No
2	The company arranged redemption of some shares.	Yes	No	Yes	No
3	The company sold some shares to workers.	Yes	No	Yes	No
4	The company arranged new share issues during the period.	Yes	No	Yes	No
5	There are shareholders owning more than 50% of shares.	Yes	No	Yes	No
6	More than two general shareholders meeting took place during the period.	Yes	No	Yes	No

The questions indicate the presence or absence of actual or potential conflict in the firm. Positive answers are assigned the values of one and negative answers the value of zero. The construction of this index is based on the work of Turuntseva, et al. (2004) though some of the questions were altered for our survey. The Corporate Conflict Index is a weighted average index with weights calculated as follows:
where p_k is the proportion of firms showing the k-th corporate conflict characteristic. The

$$w_k = \log \frac{1}{p_k}$$

reason for such weighting, as Turuntseva, et al. (2004) argue, is to apply higher weight to rarer situations (where p_k is small) which are associated with higher levels of conflict. The mean value of the index is 0.54 and the minimum and maximum values are 0 and 0.96 respectively.

Table 2: The description of variables used

Variables	Description
LC1	The share of the largest owner which measure ownership concentration. The logarithmic transformation of this variable from bounded to an unbounded is given in section 4 in footnote no.4.
LC3	The share of the largest three owners, which is another measure of ownership concentration.
Ln Labour Productivity	The natural logarithm of sales per employee ratio and is used as a measure of firm performance.
Individuals	A dummy variable equal to 1 if 'individuals' are the dominant owners and 0 otherwise. This variable is a measure of the types of dominant owners.
Other firms	A dummy variable equal to 1 if 'other firms' are the dominant owners and 0 otherwise. This variable is also a measure of the types of dominant owners.
Fixed assets	A measure of firm size
Ln Fixed assets to labour ratio	The natural logarithm of fixed assets to labour ratio and is used to measure capital intensity.
Ln Fixed assets to labour ratio squared	The squared term of Ln fixed assets to labour ratio.
Fixed investment to fixed assets ratio	The ratio of investments in fixed capital to fixed capital and is an indicator of the opportunities for discretionary projects by managers.
Standard deviation of profit	A measure of firm-specific risk. The calculation of standard deviation of profit and in each year is based on the figures of previous years. However, 1997 and 1998 figures are the same because we do not have any information for profit and sales of our sample firms before 1997.
Manufacturing sector	A dummy variable equal to 1 if the firm belongs to the manufacturing sector and 0 otherwise.
Years since privatisation	Number of years elapsed since privatisation of the firm.
Method of privatisation	A dummy variable equal to 1 if the firm has been privatised during the mass privatisation programme and 0 otherwise.
Corporate Conflict Index	An indicator of the presence of conflicts in the firm.
Ln depreciation	The natural logarithm of depreciation used as an instrumental variable to instrument firm performance.
Age of managers	The average age of managers of the firm and is also used to instrument firm performance.

Table 3: Determinants of ownership concentration (LC3$_t$)

Independent variables	Dependent variable: share of the largest three owners (LC3$_t$)				
	Random Effect	IV Random Effect	GMM with Kernel	GMM with cluster	Arellano & Bover model
LC3$_{t-1}$	0.205 **	0.189 ***	0.836 ***	0.816 ***	0.909 ***
	(2.27)	(5.59)	(10.35)	(9.24)	(9.44)
Ln Labour productivity	0.044	0.396 **	0.202	0.233	-0.175

A GAME THEORETIC LENS FOR ADDRESSING CSR IN CENTRAL AND EASTERN EUROPE

Key words: *corporate social responsibility,*
bargaining games, game theory

1. INTRODUCTION

1.1. Game Theoretic Approach

Businesses' corporate social responsibility (CSR) strategies and overall attitudes toward CSR are dependent upon a complex set of interactions with multiple stakeholders in a bargaining society. The decision by a business to engage in environmentally friendly production practices or to support community educational programs is not a decision made in isolation. Rather, such a decision is influenced by both internal and external stakeholders who often hold contradicting values and expectations. To study CSR practices related to community or environmental programs without accounting for these bargaining relationships would be unproductive. Therefore, one approach to better understanding and seeking progress in the area of CSR is to study CSR from a game theoretic framework which addresses the interwoven relationships between stakeholders.

Game theory seeks to explore and explain the interactions among interdependent decision making agents. If a given set of interactions among players can be adequately modeled then game theory can provide insight regarding the expected outcome of those interactions. This field of economics has provided a useful framework for analyzing issues ranging from business strategy to politics. However, few efforts have been made to develop game theoretic applications in the implementation and promotion of CSR. Recognizing the potential within game theory, this paper develops a game theoretic lens to view CSR and opens up a dialogue for further research and discussion.

Although there are a complex set of relationships with multiple stakeholders to model and analyze with regard to CSR, this paper will focus on the bargaining relationship most critical to a firm's success – the relationship between a firm and its customers. [1] Understanding this relationship in light of CSR can be beneficial for both policymakers and business managers who face a variety of barriers related to CSR implementation and promotion.

---

[1] In surveys conducted in various CEE countries attempting to gain businesses' perspective on CSR, business leaders indicated that consumers represented their main stakeholder, often followed closely by employees. See the reports produced by Mazurkiewicz, Crown, and Bartelli for more detailed results and analysis.

In order to model the relationship between businesses and consumers, this paper will unpack two bargaining models: the two-person ultimatum game and the three-person ultimatum game. Then, using the Güth van Damme (1998) bargaining experiment and data collected from consumers and business leaders in CEE countries, the author of this paper will argue for the need to implement policies that will in essence change the game perceived by consumers from a three-person bargaining game to a two-person ultimatum game.[2] The underlying assumption of this approach is that if the rules of the bargaining game between businesses and consumers can be altered then the challenges and hesitations in promoting and implementing CSR could be more easily overcome. Before this hypothesis is fleshed out, however, some clarity must be brought to the concept of CSR.

1.2. CSR in Central and Eastern Europe

CSR is a somewhat ambiguous, if not misunderstood, concept due to the broad strokes in which it is painted by its various stakeholders. This is perhaps especially true in the transitioning economies of CEE countries who find themselves faced with CSR initiatives imposed on them from external stakeholders in a global marketplace, primarily driven by large, multinational companies.

In response to the European Council's appeal to companies' sense of social responsibility in March of 2000 (European Commission, 2001), an extensive CSR dialogue has been ongoing within the European Union and its member states. As this dialogue penetrates the transitioning economies of CEE countries, CSR is met with a certain amount of resistance due to the unique challenges of these economies - economies which are still adapting to market-based systems. In order to discuss CSR in the context of CEE countries it is critical to first lay down a working definition of CSR.

The European Commission defines CSR in *Promoting a European framework for corporate social responsibility* as "essentially a concept whereby companies decide voluntarily to contribute to a better society and cleaner environment" (2001). The simplicity of this definition provides a good framework to use in addressing CSR. However, two issues must be clarified and emphasised. First, for CSR to be implemented and sustained long-term, it must be voluntary. This emphasis on the voluntary nature of social responsibility does not neglect the need for outside influence, but instead points to the significance of external stakeholders in shaping corporate social responsibility strategy. Second, although CSR can focus on both internal and external stakeholders, this paper will address CSR in light of external stakeholders alone. More specifically, this paper will focus on community and environmental CSR practices which are traditionally viewed as falling outside of the normal operations of business. A focus on external stakeholders is significant in the context of CEE countries because CSR is most commonly associated with internal stakeholders in many of these countries.[3] Therefore, it is especially important to open up more discussion and study concerning CSR initiatives focused on external stakeholders.

---

[2] The data used for this analysis comes from the work of Mazurkiewicz, et al. conducted in several CEE countries regarding CSR from consumer and business perspectives.
[3] According to a *Public Expectations for Corporate Social Responsibility* survey conducted in Poland in 2005 by Mazurkiewicz, et al., the top three "behaviors giving a social responsible image to a company" all related to employees. According to the survey, "respect for employees and good relations at work" was the single most important factor contributing to a company's socially responsible image.

2. BARGAINING THEORY

2.1. Introduction to Bargaining Theory

Bargaining, at its core, is a socioeconomic problem between two or more parties with conflicting interests whose cooperation could lead to the creation of a mutually beneficial surplus. The challenge, therefore, is in agreeing upon the allocation of the created surplus (Serrano, 2005). This basic bargaining problem is played out often within a variety of social, political, and economic venues. Socially, neighbors within apartment complexes implicitly reach bargaining agreements concerning appropriate levels of noise. On the political level, governments threaten sanctions and embargos in an attempt to reach a more favorable outcome concerning peace, economics, or human rights. Economically, the classic market interaction between buyers and sellers is an example of parties with conflicting interests who reach bargaining agreements when a purchase is made.

Prior to game theoretic solutions, such bargaining problems were classified as indeterminate by economists (Serrano, 2005). However, John Nash's (1950, 1953) foundational works in the early 1950s regarding bargaining established a formal bargaining theory which allowed economists to formalize positive predictions for bargaining problems. Critical to this bargaining theory, however, was the assumption of perfect rationality which means that all players are rational, all players know that all players are rational, all players known that all players know that all players are rational, etc. While this assumption is useful in developing abstract game theories, the assumption of perfect rationality creates serious challenges in the application of bargaining theory. Therefore, under the premise that humans have limited cognitive and information processing capabilities, experimental game theory emerged as a helpful subset within game theory. Based instead upon the assumption of bounded rationality, experimental game theory holds to the view that theories should be based on empirical findings rather than on abstract reasoning alone - especially since the empirical findings often contradict the abstract theories.[4]

Therefore, in an effort to develop a game theoretic approach to CSR, this paper will use the two-person and three-person ultimatum games along with the empirical findings unveiled in the Güth van Damme three-person bargaining experiment. Framing the CSR conversation under the auspices of game theory provides a unique way to address the challenges within the CSR dialogue. The following models are not intended (nor are they able) to capture all relevant aspects of the broader CSR debate. However, these models can provide a helpful framework to better understand the challenges faced in CEE countries in implementing and promoting CSR.

2.2. Two-Person Ultimatum Game

A two-person ultimatum bargaining game consists of a positive amount of money p which can be distributed between two players. The players include the proposer X, who first decides on his offer $0 \leq o \leq p$ to be allocated to the responder Y. The responder can accept the offer o, leaving the proposer with the allocation $p - o$, or reject the offer resulting in no payoffs for either the proposer or responder.

---

[4] For example, in the simple two-person ultimatum game, orthodox game theory would predict an offer of 0 or nearly 0 to the responder. However, the empirical findings indicate an offer much higher, taking into account subjective variables such as altruism, reciprocity, etc.

If perfect rationality is assumed, the game theoretic solution for a two-person ultimatum game predicts that the proposer offers the smallest positive money unit and that the responder accepts all positive offers. This is based on the assumption that the positive offer o is always and everywhere preferred by the responder to the positive offer $o – c$ (where c represents the smallest monetary unit). Therefore, if the proposer offers the responder the smallest monetary unit c, the responder would always accept this offer because $c > c - c$.

However, according to the empirical findings of ultimatum bargaining experiments, responders reject positive offers o which are significantly larger than c in the range $0 < o < p/2$ if the offer is viewed as unfair (Güth, 2000). These results cause proposers to increase their offers, often as high as $o = p/2$.[5]

2.3. Three-Person Ultimatum Game and the Güth van Damme Experiment

The three-person ultimatum game again consists of a positive amount of money p which can be distributed among the three players - the proposer X, the responder Y, and the dummy player Z. The proposer chooses an offer o for the responder and an offer d for the dummy player. The responder can accept the offer o and the offer d for the dummy, leaving the proposer with the allocation $p – o – d$, or reject the proposed allocation resulting in no payoffs for all three players. The dummy player has no bargaining power in the game and can only accept the resulting agreement or disagreement reached by the proposer and responder.

In Güth and van Damme's (1998) bargaining experiment, $p = 120$ points (10 points worth 1 Dutch guilder, and in some cases worth 2). A minimal amount $m = 5$ points must be allocated to each player. Therefore, in the case an agreement is reached, the maximum payout for the proposer is $p – m – m$, or $120 – 5 – 5 = 110$ points. Once again, if perfect rationality is assumed, the standard game theoretic solution would be one in which the responder accepts all positive offers o, regardless of d, and the proposer would seek to maximize his payout by offering the minimally acceptable offers $o = d = m$. This outcome would result in the allocation, x = 110, y = 5, z = 5.

However, in an effort to test the hypothesis that players have "a strong intrinsic motivation for fairness," Güth and van Damme (1998) ran the experiment with three different information conditions and using constant and cycle treatment modes. In the xyz-condition the responder knows the full allocation of p, including both the offer o to him and the offer d to the dummy. In the y-condition, the responder is only aware of the offer o being made to him and can only assume that the offer d made to the dummy is $5 \leq d \leq (120 – o)$. In the z-condition, the responder knows only the offer d made to the dummy player and can only assume that his own offer is $5 \leq o \leq (120 – d)$.

Güth and van Damme (1998) arrived at five important regularities from their experiment. The first three of these regularities provide valuable insight into the current bargaining relationship between businesses and consumers and will be looked at in detail in section 3.4. The five regularities are as follow: 1) Proposals depend on the information condition, with the responder sometimes getting a large share; 2) The amount the dummy receives is in all conditions very small; 3) Some proposals are rejected, although a smaller proportion than

---

[5] The empirical findings for a two-person ultimatum game are that the modal offer is 50% and offers under 30% are often rejected. This outcome holds true regardless of the absolute size of the surplus.

usually observed in the two-person versions of the game; 4) There is a learning trend; and 5) There are some differences across constant and cycle treatment modes.

3. APPLICATION OF THE GÜTH VAN DAMME BARGAINING EXPERIMENT TO CSR IN CCE COUNTRIES

3.1. Introduction

The traditional relationship between businesses and consumers has focused on the business offer in which consumers make purchasing decisions on issues of price and quality alone. This relationship is best modeled by the simple two-person bargaining game described in section 2.2 above. However, CSR-motivated companies are also able to offer consumers a social/environmental offer. This offer is the opportunity for consumers to pass along benefits to the community and/or the environment if the firm's products are used - regardless of price and quality. The nature of this bargaining relationship is dependent upon the attitudes and knowledge of consumers along with the general expectations consumers place on businesses (Mazurkiewicz and Crown, 2005). For instance, if consumers expect businesses to provide social benefits for local communities then a company's performance in this area would be factored into the purchasing decision along with price and quality and the game would resemble a simple two-person bargaining game. However, if consumers perceive social programs and environmental programs to be the responsibility of government rather than businesses than consumers will view such efforts by businesses as decreasing consumer surplus, resulting in either lower quality or higher prices. Hence, the relationship between consumers and firms in this scenario is a three-person ultimatum game.

In order to model the relationship between consumers and businesses in CEE countries with respect to external CSR practices, it is important to understand the attitudes and perceptions of consumers. Do consumers incorporate external CSR practices into their purchasing decisions or are these practices external to their buying decision? Although additional consumer surveys and research is needed in this area, detailed consumer research from Poland provides a valuable data set to conduct this analysis.

3.2. Evidence from Public Expectations Survey in Poland

In the second quarter of 2005, the World Bank Development Communication Division and the World Bank Warsaw Office, in association with the Polish Office for Competition and Consumers' Protection, conducted consumer research focused on consumer expectations for CSR in Poland (Mazurkiewicz and Crown, 2005). The general purpose of the research was to understand how and when consumers can become partners in the promotion of CSR. Specifically, the research sought to uncover if and when CSR is factored into the buying decisions of consumers. The researchers concluded from their study that Polish consumers "have not fully understood and articulated the concept of CSR as practiced in the rest of the EU" (Mazurkiewicz and Crown, 2005). To better understand this conclusion, the results from five of the questions posed to Polish consumers will be explored.

Question 1 – What are the three main behaviors giving a socially responsible image to a company?
Figure 1. *The three main behaviors giving a socially responsible image to a company (only those with >10% of respondents' votes are shown).*

Of the top ten behaviors chosen by consumers, four relate to employees, two deal with traditional consumer issues of quality and price, two focus on complying with external regulations, and two address external social and environmental issues. These findings are an indication of the current level of understanding and knowledge regarding CSR issues by Polish consumers. The emphasis upon internal stakeholders and outside regulating agencies highlights a current perception among consumers that CSR relates primarily to the traditional operations of a business.

Question 2 – Should companies, in addition to their ordinary business, consider the needs or problems of the local community?
Figure 2. *Polish consumers' response to question 2.*

Question 3 – Should companies, in addition to their ordinary business, consider the needs of the environment?
Figure 3. *Polish consumers' responses to question 3.*

215

The results from questions 2 and 3 seem to contradict the findings from question 1. However, the reconciliation of these two sets of findings can be achieved in a better understanding of what consumers actually expect businesses to do to consider the needs of the local community and environment. When asked this question regarding businesses concern for the community, 36% of consumers thought that the best way for businesses to show concern for the local community was to provide job security. Therefore, despite consumers' desire to see companies engage in CSR related activities concerning the community and the environment, consumers' expectations for how this will be accomplished are related primarily to normal business operations – employment issues, legal compliance, and product value (price/quality).

Question 4 – What motives drive social and environmental responsibility of companies?
Figure 4.   Polish consumers' responses to question 4.

Based upon the results from question 4, it would seem that consumers believe they have the ability to influence businesses actions regarding CSR. In fact, 65% of consumers indicated that the single greatest reason a company engages in social or environmentally friendly practices is to create a positive image among consumers. The greatest long-term insight from these results is the potential for government to partner with consumers in promoting CSR practices since consumers believe they have the ability to influence businesses. However, the immediate results of this survey question point more to the reality that consumers view CSR as primarily a public relations strategy rather than as core to the business' operational strategies.

Question 5 – Would you like to have more information of CSR practices of Polish enterprises?
Figure 5.   Polish consumers' responses to question 5.

The fact that only 14% of all consumers interviewed indicated their knowledge regarding CSR is sufficient points to a general lack of understanding and knowledge among consumers about CSR practices of Polish businesses. If consumers lack knowledge regarding CSR practices than it is nearly impossible for consumers to factor CSR into buying decisions.

According to these findings, the bargaining relationship between consumers and firms most resembles a three-person bargaining game when considering externally focused CSR. In essence, consumers view external stakeholders as the dummy player Z in a three-person bargaining game and therefore seek to minimize the payouts to the dummy player Z and proposer X (the firm) while maximizing their own payout (responder Y). The bargaining relationship between consumers and businesses is viewed as a three-person bargaining game primarily because consumers lack sufficient knowledge concerning businesses' CSR practices and because consumers' attitude towards external CSR practices is that such practices fall outside the scope of a business' primary operations. Even though consumers indicate a desire to see businesses concerned for the community and the environment, such efforts by businesses are only rewarded if they fall within the normal operating activities of business defined by consumer expectations.

3.3. Conclusions Drawn from the Güth van Damme Bargaining Experiment

Given that the relationship between consumers and firms in light of external CSR initiatives can be modelled as a three-person bargaining game, the regularities described in the Güth van Damme experiment may provide insight into this relationship and the expected CSR outcomes. Therefore, the first three regularities posited by Güth and van Damme will now be analyzed and applied to CSR in CEE countries.

Regularity 1 – Proposals depend on the information condition, with the responder sometimes getting a large share.

In a traditional two-person bargaining game in which consumers make purchasing decisions on issues of price and quality alone, businesses use price as a signal for how the surplus is being divided between the firm and the consumer. However, because buyers do not typically know the cost pressures faced by the firm, price is not always an accurate measure of a firm's altruistic behaviour in dividing the surplus (Rotemberg, 2006). With the added emphasis on CSR, businesses are now able to signal altruistic behaviour through explicit CSR practices that focus on the local community and/or the environment. Therefore, consumers are able to factor in both price information and CSR practices when deciding whether to accept or reject the overall offer.

However, if consumers do not value such external CSR practices (as indicated in part by the consumer survey in section 3.2) then the relationship resembles a three-person game and the businesses' CSR practices represent a signal by the proposer of a larger offer to the dummy player Z. Despite the desire among consumers for firms to be concerned for the community and environment, if the business engages in an activity which is not part of traditional business operations (as expressed in section 3.3, question 3) then the business is sending information to consumers which has little if any value.

As long as consumers believe they are receiving a fair price/quality offer then they care very little about the social offer being made to the community. In essence, the response by consumers in section 3.3, questions 2 and 3, implies that they believe businesses should

engage in community and environmental work, as long as this work does not infringe upon their price/quality offer. This attitude on the part of consumers provides a disincentive for businesses to engage in potentially costly CSR programs.

In line with this conclusion, a survey conducted in Serbia and Montenegro in 2006 concerning businesses perspectives about CSR revealed that following tax incentives and regulatory requirements, recognition by consumers is the single greatest action that could improve CSR practices (Mazurkiewicz et al., 2006). A similar survey in Poland also revealed that second to tax incentives, businesses believe that recognition by stakeholders can greatly improve CSR practices. (Mazurkiewicz et al., 2005).

Regularity 2 – The amount the dummy receives is in all conditions very small.

If consumers continue to view external CSR practices as offers to the dummy player Z, then it will be to businesses' advantage to minimize the offer to the dummy player by minimizing external CSR practices. This does not mean that businesses will not engage in any external CSR efforts; but rather, this prediction implies that businesses will only seek to maintain some minimum level of community and environmental efforts. After all, in a three-person bargaining game, a higher offer to the dummy player is often achieved via a lower payout to the proposer rather than decreasing the responder's offer. Therefore, regardless of what information the consumer has regarding price, quality, or CSR practices, businesses will be inclined to minimize the amount of surplus offered to social benefactors via community or environmental projects.

Some of the strongest evidence for this conclusion rests in the following survey question which Mazurkiewicz (2005, 2006) and his team asked businesses in various countries throughout CEE - What are the greatest risks in adopting CSR practices? Businesses in Poland, Hungary and Slovakia revealed that the top two risks associated with adopting CSR practices are increased operating costs and adverse impacts on profitability. Serbia and Montenegro, Estonia, Latvia and Lithuania all agreed that the single greatest risk in adopting CSR practices is increased operating costs.

These results from several CEE countries line up with the conclusions drawn from the Güth van Damme bargaining experiment. Companies perceive their payouts in a three-person bargaining game to be at risk since the added costs of CSR practices can not be passed along to consumers who do not value external CSR practices as a component of their purchasing decision. As long as the consumer environment remains one in which external CSR practices are viewed as the dummy player in a three-person bargaining game, businesses will continue to engage in the minimum level of CSR practices their business environment will allow.

Regularity 3 – Some proposals are rejected, although a smaller proportion than usually observed in two-person versions of the game.

Rejection rates for two-person ultimatum games are generally around 15 to 20 percent (Bolton and Ockenfels, 1998). However, in information conditions xyz and y of the Güth van Damme game, rejections rates are significantly lower at approximately 4 percent. The reason for this observed behavior seems to deal more with the offers made by the proposer than the actions of the responder. In the two-person ultimatum game, proposers are willing to make offers between 0 and $p/2$, with a greater rate of acceptance occurring at rates closer to $p/2$. However, in the three-person Güth van Damme game, proposers know that responders will

likely reject any offer below *p*/3 and therefore make most proposals between *p*/3 and *p*/2, offers which are generally more acceptable to responders.

Regularity 3 implies that in a three-person bargaining game between businesses, consumers, and external benefactors, businesses will tend to offer higher price/quality offers to consumers than they would in a two-person bargaining game in which consumers take into consideration external CSR practices into their buying decisions. In essence, if consumers do not value external CSR practices as critical to purchasing decisions, then firms must entice consumers to buy by offering a higher price/quality value package. Therefore, even though there are fewer rejections in three-person bargaining games, the underlying result for the business may actually be worse than in a two-person bargaining game because of the higher offers required in the three-person game. In the current environment, businesses are required to appease both the high expectations of consumers as well as the growing expectations of regulating agencies concerning CSR.

The pressure faced by firms in this scenario can be expressed by their desire to receive some type of tax incentive in order to carry out additional CSR practices. Again, turning to the surveys conducted in Poland, Serbia and Montenegro, Hungary, and Slovakia, the single greatest factor which could improve CSR practices according to businesses is tax incentives. Although businesses are always seeking tax incentives, the strong insistence upon tax incentives in this scenario implies that businesses are unable to meet the high expectations of consumers as well as meet the growing expectations for CSR practices and remain profitable.

3.4. Areas of Further Study

Although much research has been carried out in the past two years concerning businesses' perspectives on CSR, more research needs to be conducted in the area of consumers' understanding and expectations among CEE countries. If consumers are considered a valuable stakeholder in encouraging CSR then more research must be conducted to uncover current perceptions (and misconceptions) among consumer groups.[6] Specifically, research should focus on ascertaining insight into the following critical issues:

- Consumers' understanding (level of knowledge) of internal and external CSR practices

- Consumers' evaluation of businesses' CSR behavior in their purchasing decisions

- Main information sources about CSR and the impact of these sources

Given the framework developed in this paper, it may be of value to also research the bargaining relationships between various other stakeholders concerning CSR practices to uncover any effects these relationships have on a businesses' motivation to adopt CSR practices. Of particular interest is the relationship between a business and its employees, with respect to external CSR practices targeted at environmental or social programs.

---

[6] The methodology employed by Mazurkiewicz and the Polish Office for Competition and Consumers'
Protection in surveying consumers' expectations provides a good framework to use in other CEE countries, or
even on a smaller framework in cantons or municipalities.

4. CONCLUSION

4.1. Need for a Game Change

Given the current consumer environment in which external CSR practices related to community and environmental projects are not factored into purchasing decisions, businesses have disincentives to engage in external CSR practices. In order to encourage CSR among businesses in CEE countries, policies must be implemented which, in essence, change the bargaining game from a three-person game to a two-person ultimatum game. This can be done, at least in part, by changing the knowledge level and attitudes of consumers concerning external CSR practices. If consumers begin to expect firms to engage in environmental and community projects, and reinforce their expectations in their purchasing decisions, businesses will be forced to rethink their business and social offers.

Although the purpose of this paper is not to develop policy, the conclusions from this analysis can be helpful in shaping policy that can lead to the adoption of external CSR practices by businesses in CEE. The use of a game theoretic lens in addressing CSR reveals that the challenge is not simply in encouraging businesses to play the CSR game, but rather, the challenge is to change the game entirely.

Key words: *The best practices of enterprises,*
Small and medium enterprise (SME),
European Social Fund.

1. INTRODUCTION

1.1. The best practices of enterprises – share or not to share

Increasing productivity of all economic activities (both in private and public sectors) can help increase the living standards in the whole society. One of the many ways how to get to this aim is to share the best practices of individuals, groups, enterprises, regions, even on the national and international level. The best practices of some subject testified in its specific conditions form one important part of its knowledge potential and it seems to be relevant not to share them with other subjects. It can be one of the firm's competitive advantages. Subjects will share their knowledge including the best practices only if:

- Their practice cannot be protected by specific law instrument (patent, license etc.) and can be quite easily copied;

- The subjects suppose that sharing knowledge with other subjects can help them to solve their specific problems (to learn something useful);

- Sharing knowledge can help their business partners (including potential partners) to increase their productivity and offers better services for lower prices (network effects);

- Sharing knowledge must not worse market conditions and competitiveness of the subject.

The relations of economic subjects are both competition and cooperation – sharing the best practices is one of the forms of cooperation.

Vodacek, Vodackova (2002) systemize specific forms of cooperation of subjects: informal agreements - including sharing "free knowledge (the best practices)"; strategic alliances including sharing specific knowledge (the best practices); joint ventures; mergers and acquisitions.

Nowadays economy is based on network relation; most of the relations is not between two subjects but much higher number of subjects. Networks of economic subjects are very dynamic both on the regional platform (clusters etc.) and the international and global level. The subjects need to share their knowledge to be more effective. All forms of cooperation can be temporary and all the cooperating subjects can be potential or real competitors.

Historical experiences say that the worst competitive attacks we have to expect from the closest related subjects because they know our weaknesses better that the others. That means: let us cooperate and share the best practices, but let us be one step ahead.

1.2. Best practices of enterprises – barriers to the flow of knowledge within the firm and across the networks

Knowledge assets are embedded in firm routines and their replications are quite problematic (Nelson and Winter, 1982). The research indicates that there are substantial barriers to knowledge transfer that make knowledge transfer difficult within the firm (Leonard, 1995; Szulanski, 1996; Knott, 2003). Szulanski (1996) suggests that the major barriers to intra-firm transfer of knowledge (best practices) include: lack of absorptive capacity on the part of the recipient of knowledge; lack of credibility on the part of the source of knowledge; lack of motivation on the part of "source" or "recipient" and casual ambiguity (due to the complexity of knowledge).

The specific problem is sharing the knowledge in networks of suppliers and buyers. Internal routines of a firm or production capability may, to some extent, be contingent on inter-organizational routines which constitute the network context linking the firm's production system to system of its customers and suppliers. According to this logic, it may be possible for a buyer to exploit its knowledge assets by sharing them with suppliers in return for lower cost and/or higher quality inputs (Dyer and Hatch, 2006).

The automotive industry offers a useful research setting to test these ideas. To be effective; these complex production routines need to be adopted as a bundle of routines (MacDuffie, 1995; Milgrom and Roberts, 1992). The difficulties with adopting a complete bundle of best practices represent the key problem why network resources are not easily imitated. To solve the complicated puzzle of creating network resources, Toyota has established a supplier association and consulting team with the explicit objective of creating network resources. Supplier association facilitates knowledge sharing within the network by organizing monthly meetings (Sako, 1996).

Dyer and Hatch (2006) tested two hypotheses:

- The quality of supplier's product for a particular customer will be higher when the supplier has received knowledge transfer from the particular customer.

- The productivity of supplier's operations for a particular customer will be higher when the supplier has received knowledge transfer from the particular customer.

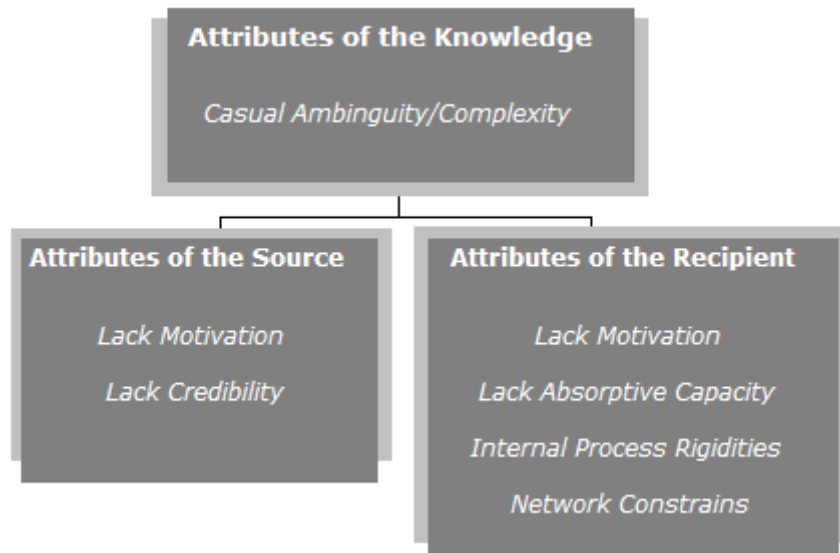
The results of their 6-year research in automotive industry support these hypotheses. Their research identifies the barriers to knowledge transfer, too. Dyer and Hatch (2006) presents a model of barriers to intra- and interfirm knowledge transfer - see Figure 1.


Figure 1   Barriers to knowledge (best practices) transfer

The economic subjects can share the best practices and it can help them to increase their efficiency, but they should analyze the real barriers inside the enterprises and the network constrains before they start the process of searching and adopting the best practices from the other economic subject.

1.3. Transfer of knowledge (the best practices) as development of human capital of the firm

Measurement of human resources and bundles of best practices is a specific question. Berk and Kaše (2005) argue that most of the empirical research are focused on different ways in which HR practices contribute to contemporary labor productivity and consequently to current financial performance. Efficiency and effectiveness of HR practices are usually tested for short-term effects.

Learning organization (Senge, 1990) and knowledge-based firm are challenges of the beginning of the 21st century. The new paradigm involves new questions and new tasks. We speak about human capital of the firm and its development, but who is owner of the capital? Where is the border between individual development and learning of the firm as a complex? Speaking about the learning development inside a firm, can we say the same about the transfer of knowledge and learning development across the networks, or even across the whole society (on the national principals, the territory principals etc.) towards learning society?

This contribution can not answer such range of complex questions. The foundation for specific research activities was set by the involvement of Tomas Bata University in Zlin (UTB) in the Europe Union projects of human resource development. Tomas Bata University

in Zlin managed to win a new project within the framework of the Operational Programme for Human Resources Development, measure 3.2 "Support for tertiary education, research and development" for the years 2006 - 2008. Faculty of management and economy won a project for Creating and Testing of a New Programme for Further Education at Universities entitled Work Smarter. Brno University of Technology, Faculty of Business and Management is partner of the UTB in this project. The Operational Programme is financed by the European Social Fund (ESF), one of the EU Structural Funds, and by the state budget of the Czech Republic. The territory of the Czech Republic is qualified for Structural Funds assistance as the less well-off regions of Europe with the exception of the NUTS II region Prague and ESF co-finances development programmes here.

The mission of this project is to bring up and enforce innovative approaches and methods in Human and Resource Development (HRD) in the Czech small and medium enterprises, to create a "learning environment" and to exercise the concept of lifelong learning in day-to-day practice of our enterprises.

The project analyses and monitors the information and methodological needs in HRD in SME. One of the essential activities is promotion and awareness in lifelong learning. We need to increase the level of further education systematically, particularly managerial and entrepreneurial development and training. Application of principles and mechanisms for quality assurance and assessment in HR management and development in enterprises is very important for this pilot project.

The strategic aim of HRD in the Czech Republic is to enhance competitiveness of national manpower on the international labor market, to increase employment, adaptability and flexibility of the labor force and to improve competitiveness of the Czech companies and national economy. This project contributes to fulfill this aim.

The first part of the project was focused on the research of the needs of the enterprises and their employees in HRD and this contribution analyses the first results.

This contribution focused on the effort to answer the question which topics of "free shared best practices" are demanded by firms and employees. The contribution supposes the motivation of all participants of the knowledge transfer, absorptive capacity on the recipients' part, credibility of the source firms.

2. METHODOLOGY

2.1. Secondary research – changes in structure of employment in the Czech Republic

For the purpose of complex understanding the foundations of the primary research in the Czech enterprises, we have to describe the macroeconomic development and actual situation in the Czech Republic.

The Czech Republic is a transitional economy, governed by its inheritance from its socialist past, which is changing more or less successfully to a free market. Macroeconomic policies are focused on controlling inflation and the Czech Republic is successful since 2000 to fulfil the Maastricht criteria for financial stability. On the other hand the situation of public finance

is not optimistic and the state budget deficit is growing very rapidly, as it has been appointed out by the IMF.

The transformation on the microeconomic level was even harder. The transformation of ownership through privatization was specific in the Czech Republic and we can speak about 2 waves at least. In 1992-1993 the first wave of voucher privatisation and division of federation to two separate countries, the Czech Republic and the Slovak Republic, completed both the political and economical separation of two specific parts of the federal state on the national principals. Both countries developed separately then but in close cooperation, especially on the labour market. The Czech Republic passed political and economic crisis in 1997 that led to the strategic decisions of the government about privatization of biggest banks and financial institutions. The changes in a bank sector, which is a typical capital distributor in Central and Eastern Europe (CEE) because of week stock exchange system, opened completely new situation on the labour market – privatisation in the bank system fastened changes in the micro economic sphere and the unemployment rates grew fast as well. The influence of direct foreign investments flow was very important that time – it helped the economy to keep the balance of payments and create new work opportunities.

The Czech Republic has high levels of employment in traditional manufacturing sectors, including engineering. But the structure of the economy is more diversified: manufacturing forms 13 % of the registered businesses and there are 920 enterprises with more than 250 employees there; agriculture forms 5 % of registered businesses, but there are only 45 enterprises with more than 250 employees there. Construction forms 11% of registered business and there are 75 enterprises with more than 250 employees there. Wholesale and retail trade forms 28% of registered businesses and there are 150 enterprises with more than 250 employees there.

The sector of services is growing up but its share on the gross domestic product is not as high as we wished. The growth in hotels and restaurants was 1, 7 % in the 3rd quarter of 2006. Post and telecommunication growth was only 0, 3 %, sales in computer and related activities was 10, 8 % at the same period according to the news release of the Czech Statistical Office. In the long term, the fastest growth of the sales was recorded in the recruitment on the labour market and provision of personnel (24, 6 %).

2.2. Primary research – empirical research of the needs of training in Czech enterprises

The primary research reflects the macroeconomic development in the Czech Republic described in chapter 2.1. The main developing sectors in the Czech Republic are manufacturing and business services. Tomas Bata University research team prepared list of 50 relevant training areas and discussed the topics in several workshops with top managers of Czech industry and service leaders. The primary research was prepared and the research was done with randomly chosen employees from the whole Czech Republic during one month 2005. To compare the results with opinions of university students we prepared parallel research with relevant number of students of Faculty of Management and Economics in Zlin. Both researches were organized at the same time and strictly the same conditions to eliminate possible distortions.

One of the aims of the research was to identify the prospective contributions of the training of the specific topic to the development of the individual employee and the prospective contributions to the development of his firm. The research team in cooperation with top

managers divided the topics to several groups and classified them using the scale: 1 – contribution only for an employee (firm is not able to use it for its purpose); 2 – more contribution for an employee, less for his firm; 3 – contributions of the training are equal for an employee and his firm; 4 – more contribution for the firm, less for an employee; 5 – contributions only for the firm (an employee is not able to use it for his private purpose). The results of this part of research can clarify the interests of employees of specific topics and describe the equilibrium of interests of the firm and its employee.

3. RESEARCH OF THE NEEDS OF ENTERPRISES IN HRD

In cooperation with the top managers of six successful and well-known Czech enterprises we prepared list of 50 important areas that can help the enterprises to increase their competitiveness and market success. The first task for the research team in cooperation with the top managers was: to choose 30 most important topics for the training of employees of the Czech enterprises. The other task was to compare the demand for these educational topics presented by top managers of enterprises with the choice of the employees of Czech small and medium enterprises.

The research examined opinions of the Czech employees from different branches of the economy throughout the whole territory of the Czech Republic. The average age of the respondents was 27 years; half of the respondents were women; all the respondents finished high school education.

Table 1 TOP 10 topics recommend by the group of employees for a successful career

_____

      1. Self-management, asking where I am, where I want to go.
      2. Personal time management.
      3. Keep improving.
      4. Planning.
      5. Make decisions from the point of view of the future, not the past.
      6. Fight the stereotypes; do not lose the self-motivation.
      7. Build your personal relationships.
      8. How to motivate other people.
      9. Successful negotiation.
      10. Do you understand the view of other people?

_____

The research shows the emphasis on the soft skills of an employee, the needs of psychological approach more than the need of hard skills such as involving the principals of lean production, TQM, best practices in logistics and other topics, that recommended the top managers in the first brain storming that brought the list of the best practices increasing the competitiveness of SME on the market. The different expectations of the topics and contributions of further learning from the point of view of employers and employees seems to be dangerous and can threaten the results of learning process. The conclusion for the next steps of the project is to harmonize the needs and expectations of the employers and employees before preparing the e-learning modules for the specific topics that show the best practices in the Czech enterprises.

To compare the opinions of employees the research team put the same task to the University students preparing for their careers in enterprises – average age of respondents was 20. The results were different.

Table 2 TOP 10 topics recommended by the group of students

_____

1. Keep improving.
2. Build the good will of your firm.
3. Forecast the future.
4. Planning.
5. "Sell" your good results; measure your success.
6. Do not make mistakes.
7. Build your personal relationships.
8. Self-management, asking where I am, where I want to go.
9. Successful presentation.
10. Make decisions from the point of view of the future, not the past.

_____

The specific aim of the primary research was to identify the prospective contributions of the training of the specific topic to the development of the individual employee and the prospective contributions to the development of his firm. The research team in cooperation with top managers divided the topics to five groups and classified them using the scale 1–5.

The chosen 30 topics were set to 5 groups.

Table 3 Division of the offered topics into groups

_____

1 – Contribution only for an employee (3, 3 % of topics);
2 – More contribution for an employee, less for his firm (13, 3 % of topics);
3 – Contributions of the training are equal for an employee and his firm (20 % of topics)**;**
4 – More contribution for the firm, less for an employee (26, 7 % of topics);
5 – Contributions only for the firm (36, 7 % of topics).

_____

Most of the 30 offered training topics identify prospective contribution for the firm and partly for the employee. This division of topics reflects the efforts of the managers to support the aims of the firm and the private motivation of the employee is not important from their point of view.

On the other hand we can discuss the effectiveness of the employee education in the situation, when he is not motivated to learn the best practices and use them in his work.

The following Figure 2 recorded relative numbers of chosen topics of two groups of participants of the research – each respondent chose 10 favorite topics. The first curve describes the relative numbers of offered topics and we can compare it with the reaction of

respondents - the second curve describes the employee's choice of topics, the third curve describes the student's choice of topics.
Figure 2   Employee's choice of training topics according to the scale of contribution to the individual and the firm (1 – contribution only for an employee; 2 – more contribution for an employee, less for his firm; 3 – contributions of the training are equal for an employee and his firm; 4 – more contribution for the firm, less for an employee; 5 – contributions only for the firm), compared with the choices of a student group.

We can interpret the results of the research as follows.

Table 4 Average employee portfolio of chosen topics

_____

      7 % of topics develop their personal knowledge (they were not offered more);

     16 % of topics develop more their personal knowledge and less contribute the development of the firm (they were not offered more);

     25 % of topics develop both the individual and the firm knowledge;

     28 % of topics develop the firm knowledge and less the individual knowledge;

     24 % of topics develop only the firm knowledge.

_____

We can compare these results with the division of the offered topics in Table 3. The employees preferred the topics from the groups 1, 2, 3 and 4. The number of the chosen topics from the group 5 was rather low (compare 37, 7 % of offered topics to 24 % of chosen topics).

We can compare the results of the employee group with the group of students - Table 4 we compare with the average student portfolio recorded in Table 5.

Table 5 Average student portfolio of chosen topics

_____

4 % of topics develop their personal knowledge;

16 % of topics develop more their personal knowledge and less contribute the development of the firm (they were not offered more);

22 % of topics develop both the individual and the firm knowledge;

29 % of topics develop the firm knowledge and less the individual knowledge;

29 % of topics develop the firm knowledge without any contribution to the individual knowledge development.

_____

The results of this part of research show the preferences of employees – they prefer the topics that can help their personal development. They accept the needs of the development of the knowledge of the firm in scales 3 and 4, but their willingness to develop the knowledge capacity of their firm in the specific topics such as logistics, quality, lean production etc. sorted in the scale 5 is rather low. They were offered 11 topics (37, 7 %) with the highest contributions for their firm, but they chose them as a part of their training portfolio only in 24%.

The results of the student group are similar, only their willingness to learn and train the topics important for their potential employer is a little higher (29 %).

The research shows that the University students are less egocentric in the first topics; they prefer the enterprise point of view to self-development of the employees. On the other hand they undervalue the topics of the lean production, maintenance, quality and logistics, as well as the employees.

Both researches give us new information and we can do the recommendations for the next steps towards effective and valuable learning programme for further education increasing the productivity in the Czech small and middle enterprises. We know the most demanded topics for the training of employees balanced on the recommended topics chosen by the top managers of successful firms. The results of the research have shown the importance of motivation of the employees towards accepting the aims of development of knowledge of their firm as their own aims.

4.   CONCLUSIONS

The transfer of knowledge (the best practices) as development of human capital of the firm is important as the cooperation of the research team with top managers of the Czech successful

enterprises has confirmed. The workshops helped to create the list of 50 important topics for training of employees. The following selection has chosen 30 core topics and they were offered to employees of randomly chosen small and medium enterprises. The research with employees affirmed that such training is possible and the employees accepted most of the offered topics as contributing both the firm knowledge development and their individual development.

The research was focused on the barriers on the recipient's part; especially the potential lack of motivation and the lack of absorptive capacity (see Figure 1). The results of the research confirmed that the motivation of employees is conditioned by the possibility of potential contribution of the training (transferring best practices) for their individual development. The contributions only for the development of the firm knowledge capital are not sufficient for the employee's motivation.

Specific questions about the transfer of knowledge are on the source side – the first contacts with the successful firms "working smarter" that are able and credible enough to transmit their "free knowledge" to the recipients confirm the expectations of the research team that these firms have enough motivation to offer their experiences "free of charge" to the other enterprises in the economy. This part of the research needs specific methodology and independent research activities which are not presented in this contribution.

The fundaments show that people are greatest assets of every enterprise. These people need the right knowledge, skills and motivation to work efficiently. But we have to ensure the investments to the staff are making difference; the investments to their education lead to the results we desire. It is the last part of our continuing research and the results will be presented in special contribution.

Key words: *corporate charity, sponsoring, tax legislation, Transition*

Abstract

This study explores corporate philanthropy in the Czech and Slovak Republics–the determinants of corporate charitable behavior and their underlying motivation. It is the first quantitative study for transition economies, analyzing data from two surveys for 577 and 162 firms over three (2001-2003) and five (2001-2005) years in the Czech Republic, and for 152 firms over four years (2001-2004) in Slovakia. It is the first study that distinguishes different channels of support, namely, sponsoring and giving.

The results show that corporate charity in both countries is motivated by maximization of managers' utility, rather than maximization of profit. The study fails to find a difference in the motivation for sponsoring and giving, but documents differences in their use by firms. It fails to support the usual claim that foreign firms give more than the domestic ones. It identifies a significant difference between the two countries: Slovakia lags behind the Czech Republic, its giving is smaller, the importance of large and international firms is higher, and small companies behave more in an ad-hoc manner. Importantly, the study fails to identify any significant decline in giving in Slovakia in 2004, contrary to the expectations resulting from the radical changes in its tax legislation, though it shows that foreign-owned firms shifted their support from giving to sponsoring. In addition, while participation on philanthropy has been steadily increasing in the Czech Republic, it has remained stable in Slovakia.

1. INTRODUCTION

In this work we study corporate philanthropy in the Czech and Slovak Republics, focusing on corporate financial contributions, exploring giving patterns and the impact of changes in the tax rates. The present analysis is the first quantitative study in transition countries. It compares two transition economies with a long common history but divergent recent evolutions, among other things in the legislation governing corporate giving, which can be expected to translate into significant differences in the philanthropic behavior of firms.

The existing quantitative economic studies of corporate charitable behavior all focused on developed economies such as the U.S.A. (e.g., Trost, 2005; Boatsman and Gupta, 1996; Navarro, 1988) or Great Britain (Brammer and Pavelin, 2005; Campbell et al., 2002). None of the existing studies of corporate charitable behavior in transition economies (e.g., Russia: King and Tchepournyhk, 2004; Ukraine: Ilko, 2004) includes quantitative data analysis. The major problem of this unsatisfactory state of affairs is the lack of data and difficulties related to their collection.

The situation in the Czech and Slovak Republics is symptomatic: even though several studies of corporate giving were conducted in the Slovak Republic (NDS, 2005; Velšic, 2004; Marček and Dluhá, 2002) only one of them asked to specify the donated amounts. Nevertheless, the sample is small: 107 responses for one year, 2001 (Marček and Dluhá, 2002). The only study for the Czech Republic is a survey conducted by Donors Forum[2] in 2004 (DF, 2004). In the present work we use these data (for the Czech Republic) and extend them with data that a market survey company collected on our behalf in both the Czech and Slovak Republics.

The present study is the first one that distinguishes between sponsoring and giving, two tools corporations may use to financially support philanthropic causes. It is, therefore, the first study that allows for comparison of their use, and the initial empirical test of the theory that the motivation of companies varies across the different giving ‚tools' they use (Galaskiewicz and Colman, 2006). We decided to distinguish sponsoring and giving because they are subject to different tax treatments, and we expected that this will induce corporations to use them differently. Sponsoring enters books as costs, the contract requires the receiving organization to provide some services in return. Sponsoring usually occurs in sports or cultural activities, the supported organization advertises the sponsors in return for the funding. Giving, on the other hand, is established by the giving contract, nothing is required in return.[3]

Our analysis draws on a theoretical model developed in Clotfelter (1985) and extended in Navarro (1988). We employ panel data econometric methods to capture the unobservable firm specific effects, and treat for sample selection.

The results document a significant difference between the two countries, with the Slovak Republic lagging behind the Czech Republic, particularly in giving. We fail to identify any significant general decline in giving in Slovakia following the changes in legislation in 2004 that made giving more expensive, but we observe that firms with foreign owners shifted their support from giving to sponsoring. In addition, we observe that, while philanthropic expenditures in the Czech Republic have increased steadily over the studied period, they have remained stable in Slovakia, suggesting that the change in legislation might have counterbalanced a similar positive trend. While we observe significant differences in characteristics of companies that sponsor and give, the role of the tax rate is the same for both tools—they do not have any effect. But, we do observe a difference in behavior of firms with foreign and domestic owners in Slovakia, suggesting that different owners may response differently to tax legislation. We fail to find support for the claim that foreign firms are more generous than the domestic ones (e.g., Bussard et al., 2005; BLF, 2004).

---

[2]Czech nonprofit organization focused on support of foundations, and corporate philanthropy; www.donorsforum.cz.
[3]This does not mean that there is nothing given in return. But the potential payback occurs out of corporate books and may be of a less tangible nature.

The study is relevant for various actors related to philanthropy: it examines the relevance of the changes in the tax legislation on corporate contributions, thus, on the income of charities, which often provide public goods that would otherwise had to be provided by public agencies. The results are important for the institutions helping to build a corporate giving culture in transition economies, suggesting that their work, indeed, makes a difference, and helps to point out the new target areas. The study is also relevant for nonprofits in that by understanding corporate behavior it may help them to target their donors more effectively.

2. LITERATURE OVERVIEW

The first part of this section is focused on the literature providing rationales for corporate giving. A number of theories have been developed to explain the motivation of firms for philanthropy; we briefly introduce the prominent ones but focus on two, profit maximization and managerial utility maximization.[4] It is necessary to keep in mind that all these theories have been developed in established economies with long histories of corporate philanthropy, the differences expected in transition countries are summarized in Section 3 below.

2.1. Theoretical studies

Two classes of corporate giving theories are distinguished in literature, economic and organizational. The economic theories focus on the underlying motivation of companies to give, i.e., internal factors. The organizational theories, on the other hand, explore the conditions in the corporate environment that affect giving, i.e., external factors. The literature provides five prominent economic theories: maximization of profit, maximization of managerial utility, altruism, corporate social responsibility (CSR), and political theory; and four organizational theories: agency, stakeholder perspective, resource dependence, and institutional theory. The two most often applied theories are maximization of profit and maximization of managerial utility (e.g., Clotfelter, 1985; Navarro, 1988; Boatsman and Gupta, 1996).

Profit maximization is a firmly established and often applied theory as corporations are, in the first place, expected to maximize their profit. All their activities, including corporate charity, are therefore assumed to support this objective. Corporate charity, at first glance, seems to be only a waste of corporate funds, mitigated slightly by the possibility to deduct donations from taxes[5]. But, there is an indirect positive effect usually compared to that of advertising that makes corporate giving profitable: giving is claimed to positively influence the public image of the company (i.e., shifting out the long-run demand curve faced by the company). Moreover, giving is claimed to decrease the costs of labor by increasing employees' loyalty and productivity and decreasing their turnover.

Maximization of managerial utility is the major competing hypothesis. According to this theory corporate giving results from a principal-agent problem in the company. Managers,

---

[4]Extensive surveys of corporate giving theories are available in Galaskiewicz and Colman (2006) and Abzug and Webb (1997). This section is based on these surveys.

[5]Donations are deducted fully if their volume remains below a deductibility limit, the price of giving is then (1-t), t is the corporate tax rate.

insufficiently controlled by the owners, use corporate funds to maximize their utility through perks, charitable giving being one of them.[6]

Both these rationales have been modeled and straight-forward testable hypotheses have been derived: the optimal level of giving in firms maximizing profit does not depend on the corporate income tax rate. But, the tax rate does matter if managers give to maximize their utility (Clotfelter, 1985; Navarro, 1988; Boatsman and Gupta, 1996; Jankech, 2002). Boatsman and Gupta (1996) show further that the impact of tax rate depends on the budget constraint imposed on the manager: if the constraint binds the income effect prevails and the tax rate has negative impact. If the constraint does not bind the substitution effect prevails and the effect of tax rates is positive. But, this model and its predictions hinge on two strong assumptions: firm optimizes over one period only and giving is fully tax deductible.

The assumption of full deductibility of giving is not necessarily valid in our environment.[7] But, as shown in Jankech (2002), predictions of the basic model remain valid even if we relax this assumption, i.e., tax rate affects the optimal level of giving only if it is motivated by maximization of utility. He shows that an increase in the deductibility limit, if it were binding, leads to an increase in giving. This result is independent of the specific motivation for giving, maximization of profit or utility.

Clotfelter (1985) relaxes the second major assumption of the original model; he develops a two-period model that allows for accountability of the long-run payoffs of giving, he omits the consideration of managerial utility and focuses only on profit maximization. Donations from the first period build goodwill and pay off also in the second period. In this setting the predictions formulated above do not hold. If a firm maximizes profit over several periods, then tax rate affects the optimal level of giving—it is optimal to shift giving to periods when it is cheaper (i.e., the tax rate is higher). The extent of these shifts depends on the discount factor and the rate of depreciation of the accumulated capital. If there is no depreciation it is optimal to give most when it is cheapest and 'live' from the payoffs later on. The rate of goodwill depreciation depends on the corporate environment, corporations may decrease it by establishing a foundation, which would collect donations in the good years and pay them out smoothly over time, ensuring payoffs in later periods for a good price. Including maximization of managerial utility in a two-period framework is likely to lead to less clear-cut predictions, as tax rates will affect not only the permanent level of giving (one period model result) but also the timing of donations (two-period model), making it difficult to distinguish between maximization of utility and profit.[8]

The remaining three economic theories have not been modeled yet: according to the altruistic theory corporations give because their owners are altruistic and care about worthy causes. Webb (1992) provides several reasons why an owner may prefer giving through the corporation: higher effectiveness of bigger donations that would be too big for an individual donor (big donation to one organization is more effective, thus, may better serve the purpose of donors), double-taxation of dividends (it is cheaper to give from company's profit), and free-riding (when giving corporate money all shareholders are 'forced' to give

---

[6]Managers may have various motives for their philanthropic behavior, they may give to gain status, prestige, or gifts in exchange, or they may be altruistic. Predictions of this theory do not rely on their specific motivation.
[7]The limit for tax deductibility is high enough not to be binding, i.e., the full amount of contributions decreases the tax base. More details in Section 3.1.
[8]We attempted to extend the model for consideration of managerial utility maximization, but the task turned out too difficult, for now.

proportionally). According to political theory, corporate giving is used to influence corporate environment (Galaskiewicz and Colman, 2006). The Corporate Social Responsibility (CSR) concept has gained significant attention particularly in the last decades. According to this theory corporations have a 'duty' towards their stakeholders to behave responsibly, they are expected to 'optimize' rather than maximize their profit, taking into considerations a triple bottom line of economic, social, and environmental values (e.g., Bussard et al., 2005; BLF, 2003). Corporate giving is one of the tools they may use to fulfill these expectations.

The literature so far does not provide a testable hypothesis that would distinguish among these theories. Moreover, it seems that these theories may be included in the two major theories explained above. The altruistic theory assumes altruism, or utility maximization, of owners, which, on the outside cannot be distinguished from the maximization of managers' utility. Internally, it would be distinguishable if we observed the extent of the principal-agent problem in the company, i.e., the extent of owners' control. The CSR theory could be incorporated in profit maximization as an adjustment of the corporate environment for the increased power of various stakeholders. This merge is further supported by the shift of CSR from a competitive advantage to a must in many established economies (e.g., Brammer and Pavelin, 2005). The political theory can be identified within both main theories, depending on the motivation for the change in the environment, which could be maximization of profit or utility (of managers or owners).

Organizational theories examine the specifics of corporate environment. Somewhat simplistically, these theories suggest that it is necessary to identify the strongest stakeholders and evaluate their impact on corporate charitable behavior. The agency theory corresponds to the utility maximization theory, suggesting power is in the hands of managers, resource dependence theory suggests powerful suppliers/consumers, and the institutional theory focuses on the impact of higher uncertainty in the environment.

Galaskiewicz and Colman (2006) provide an overview of corporate charity; they structure their analysis according to the different tools corporations use to support/collaborate with nonprofits (e.g., financial support, donations of products, sponsoring, volunteering, etc.). They suggest that different types of collaboration result from different motives for giving. Taking into account that giving typically results from an interplay of several motives, i.e., identification of the main one may be rather cumbersome, it seems optimal to explore the motivation separately for different giving tools.

2.2. Empirical studies

In this section we briefly introduce empirical work on corporate giving focusing on studies that explore the role of tax legislation for giving. Extensive surveys may be found in Galaskiewicz and Colman (2006), Clotfelter (1985), or Webb (1992).

There exist two papers that empirically examine the motivation of corporate donors by examining the impact of taxes: a cross-sectional analysis by Navarro (1988) and a panel data analysis by Boatsman and Gupta (1996).[9] Both studies are based on the one-period theoretical model described above, they test its prediction that taxes affect giving only if firms give to maximize managerial utility.

---

[9] Other papers on corporate giving explore different topics, e.g., main factors that influence on giving (e.g., Brammer and Pavelin, 2005; Seifert et al., 2003; Webb, 1992) or the impact of corporate charity (e.g., Chang, 2003).

The empirical specifications in these papers differ due to the different data sets and econometric techniques used. Boatsman and Gupta (1996) analyze panel data, 212 firms over 5 years; their basic specification therefore includes only tax rate and income as the fixed effect model used captures the firms specific variables (constant in time) in the firm dummy variables. Navarro (1988) uses cross-sectional data, 249 Fortune 1000 firms from the period 1976-1982. His specification therefore includes also firm specific variables, such as, labor intensity, free riding (ability to rely on others' giving), debt-equity ratio, change in dividends, or salaries of executives.

The results from Navarro (1988) support the hypothesis that giving is a form of advertising motivated mainly by profit maximization.[10] Analyzing the firm specific variables he shows that giving serves as a quasi-fringe benefit to employees through its impact on the community (environment), and that giving is lower due to free riding (firms in communities with high number of firms give less). Boatsman and Gupta (1996) provide results from a fixed effects specification, which proved to be the best in comparison to pooled ordinary least squares and random effects model. Contrary to Navarro (1988) they conclude that giving is motivated by managerial utility because it is affected by the tax rate. The effect of the tax rate is negative, which means that the budget constraint imposed on the managers is binding. Income has a very small positive effect on giving. The possible cause of the opposite results in the two studies is the data and measures used. The Navarro (1988) study works with cross-sectional data: it is possible that there are unobservable firm characteristics that may bias his results. Another bias may be caused by the measurement error in the tax rate: Navarro (1988) uses average tax rate instead of the marginal tax rate that matters in the theoretical model and is used in Boatsman and Gupta (1996).

3. CORPORATE GIVING IN TRANSITION: THE CZECH AND SLOVAK REPUBLICS

In this section we summarize the specific features of transition countries, focusing on the differences to the more developed economies. We expect that, in line with the organizational theories (Section 2.1), these features affect the philanthropic behavior of corporations.[11] Even though during the analyzed periods both the Czech and Slovak Republics were considered established market economies (CERGE EI, 2004; CERGE EI, 2002; IVO, 2002) there remained characteristics that differed from those observed in more developed economies. We next discuss differences in the market environment, economic conditions, and philanthropic tradition.

The market environment in transition economies is not developed to the extent observed in the developed economies. The lag is due to the short history of these markets and their fast and unstable development in a short period of time. The major consequences were significant uncertainty, in particular in the early years of transition, and low transparency and high levels

---

[10]The tax rate is significant in one specification only and with a small negative effect, offering a very weak support for maximization of utility.
[11]We compare the situation in the Czech and Slovak Republics to that in the U.S.A. and western European countries. We realize that the differences present here are even stronger in countries east of Slovakia, further strengthening our arguments, as suggested in Ilko (2004) for Ukraine, or King and Tchepournyhk (2004) for Russia.

of corruption, which remain today (Hanousek et al., 2005; CERGE EI, 2004; Lízal and Kočenda, 2002; CERGE EI, 2002).[12] An inefficient and complicated legal system continues to support corruption and intransparent behavior.[13] Uncertainty in Slovakia was higher until 1998 due to the political instability, marked by a severe lack of transparency, corruption, and politically motivated decisions. Many of these problems, however, remained also after the change in the government in 1998, though their intensity decreased significantly (IVO, 2002). A number of important changes improving the Slovak market environment occurred in 2003-2004, namely, the reforms of the tax legislation, health care, and the pension system.

Countries in transition continue to lag behind their more developed counterparts also in their economic performance, an important determinant of corporate charity.[14] Lower levels of giving in post-communist countries are, indeed, often explained by the unfavorable economic conditions (Kivilo, 2005; Ilko, 2004; King and Tchepournyhk, 2004; Brooks, 2002, Marček and Dluhá, 2002). Fidrmuc and Gerxhani (2005) show that unfavorable economic conditions in transition account also for their low stock of social capital, measured by civic participation and access to social networks. Nevertheless, both the Czech and Slovak Republics have experienced significant economic growth in the periods under consideration,[15] suggesting parallel growth in corporate philanthropy.

A lack of tradition of philanthropy[16] and corporate social responsibility (CSR) is another feature of transition countries that is expected to strongly negatively influence corporate charitable behavior. Development and popularization of CSR has been supported by the International Business Leaders Forum (BLF), a nonprofit organization with national branches in both countries. BLF in the Czech Republic has been in existence since 1992, when it was established in then still common Czechoslovakia (www.blf.cz). The Slovak BLF came into existence only in spring 2004 (www.blf.sk). Nevertheless, the number of companies understanding and implementing the concept of CSR remains low in both countries (CR: BLF, 2004; SR: WB, 2004).[17] One of the possible explanations of this low engagement is, according to BLF SR (2005), the ignorance of the public, thus, insufficient pressure on companies to get involved.

The inefficient operation (or at least a perception of such) and unprofessional behavior of nonprofits, caused to some extent by their short histories[18] and reliance on volunteers rather than professional employees, further hinders cooperation between the corporate sphere and nonprofits (Marček and Dluhá, 2002). Attempts to enforce cooperation among organizations

---

[12]The corruption perception index in both countries remains very high, it was 4.3 on a 10 point scale, 10 being the best, in both countries in 2005 (47-50th place, together with Greece and Namibia, among 159 countries, www.transparency.org).

[13]The income tax law in the Czech Republic was amended 43 times in 10 years, steadily increasing in complexity and number of exceptions (CERGE-EI, 2002). Legislation in the Slovak Republic was afflicted by similar problems (e.g., Lizal and Kocenda, 2002), including the problems with complexity and frequent changes (MFSR, 2003; Moore, 2005). However, the laws governing corporate giving remained simple (see Section 3.1).

[14]Corporate giving remains a relatively stable fraction of before tax profits in the U.S.A. (Clotfelter, 1985; Galaskiewicz and Colman, 2006).

[15]www.oecd.org

[16]Nonprofit organizations and charitable giving had been practically non-existent during communism.

[17]Charitable giving is one of the aspects of CSR, but the main focus of corporations in the Czech and Slovak Republic remains on the internal issues such as care for employees, transparency, and environmental protection (BLF, 2004; WB, 2004).

[18]Most of the nonprofit organizations in transition countries have been established since the fall of communism, there are only a few with longer tradition, e.g., the Red Cross or amateur sports organizations (see e.g., Fric and Goulli, 2001).

in the two sectors (supported by nonprofits such as PANET (SR), or Donors Forum (CR)) have strengthened after accession to the EU in May 2004 via the European regional programs focused on cooperation among three sectors: public, for-profit, and non-profit (Bussard et al., 2005; Dluhá and Marček, 2003; DF, 2004).

In Slovakia, there is yet another difference which is expected to significantly affect corporate charitable behavior, tax assignation.[19] Tax assignation for physical persons, an opportunity to assign a fraction of one's paid income tax to a particular charitable or publicly beneficial purpose, was introduced in 2000 to become effective in 2002.[20] The fraction that could be assigned was set to 1%. The scheme was extended to corporations in 2003, the extension was proposed by the government after it rejected nonprofits' request to distribute a fraction of income from privatization as was done in the CR. While tax assignation for physical persons exists in several other, mostly transition, countries,[21] tax assignation for corporations is unique for Slovakia. In 2004 the fraction that may be assigned increased to 2% for both corporations and physical persons.

Tax assignation represents an additional source of funds for nonprofits[22] and we include it, to a certain extent, in this study even though it is not philanthropy in its true sense. Corporations that assign do not donate their own resources, they only distribute fraction of state funds. Nevertheless, firms usually consider assignation a form of philanthropy[23] possibly because assignation requires that the firm makes a decision and shows some interest in the organization it supports.

3.1. Relevant legislation

This section summarizes the legislation that governs corporate philanthropy. Legislation in the Czech and Slovak Republics, including that governing corporate philanthropy was very similar (e.g., Lízal and Kočenda, 2002) until 2004 when there were several major changes in Slovakia. In this section we focus on three different tools with different tax treatment that corporations use to support nonprofit organizations: sponsoring, giving, and in Slovakia also tax assignation.

Sponsoring, governed by a contract about sponsoring, is often compared to advertising. Expenditures on sponsoring enter books as costs, decreasing taxable income without further restrictions. The corporate tax rate is therefore the only legal factor that influences the expenditures on sponsoring. Due to an income effect, increasing the tax rate increases sponsoring, because its price is lower. However, the income from sponsoring is a business income for the receiving organization, and it has to be taxed.[24]

---

[19]The attempts to introduce tax assignation in the Czech Republic have not been successful yet (www.rozhodni.cz).

[20]The law became effective two years later because the government expected a decline in the budget caused by a significant decrease in corporate tax rate in the year 2001.

[21]For example, Hungary, where it was first introduced, or Poland (www.onepercent.hu).

[22]Tax assignation is indeed a significant additional source of income, in 2004 corporations assigned 570 million Sk, 92% of the total amount they could have assigned. In addition, 276 million Sk were assigned by physical persons (SNSC, 2005).

[23]According to a survey performed in 2005 84% of companies considered assignation a form of philanthropy (NDS, 2005).

[24]NPOs in the Czech Republic may deduct 30% of their income from their taxable income, or 300,000 Czk (if 30% is less), maximum possible deduction is 1,000,000 Czk. The upper bound on deductions in the SR is 300,000 Sk.

Giving, governed by a donation contract, includes financial donations and donations of products and services. Expenditures on giving represent after-tax expenditures, tax deductible up to a limit. Therefore, giving is affected not only by the corporate income tax rate, as is sponsoring, but also by the limit on tax deductibility. The limits vary across countries, their evolution in the CR and SR is summarized in Table 1. The legislation in the Czech Republic has become complex, with many additional exceptions and changes in the limit in the last four years.[25] The limit in Slovakia had been stable, 2% of the taxable income[26] until 2004, when new legislation abolished the deductibility of donations.[27]

Tax assignation, which exists in the Slovak Republic only, allows corporations (and physical persons) to assign a fraction of their taxes to particular purposes, namely, to the listed publicly beneficial organizations, most often nonprofits. The assigned funds belong to the state, the government delegates the decision about how to distribute the assigned funds (collected taxes) to the tax payers if they choose to do so.

Table 1: Tax Legislation

Czech Republic		Slovak Republic	
Limit on tax-deductibility			
2% of tax-base		2% of tax-base	
5% (if natural disaster causes)			
10% for 2002-2003 (floods)		Since 2004 – no deductibility	
Corporate tax rate			
Until 2004	31%	2000 – 2001	29%
2004	28%	2002 – 2003	25%
2005	26%	2004	19%
2006 and later	24%		
Tax assignation			
		Since 2003	2%

3.2. Hypotheses

The hypotheses are motivated partially by the model by Navarro (1988); transition is expected to have no effect on the qualitative predictions of the model, but it is expected to influence the quantitative predictions: due to lower appreciation of corporate charitable behavior by consumers we expect that the impact of giving on demand is smaller, i.e., the profit-maximizing level of donation is lower. For the same reason we expect that the utility managers gain from giving is lower, relatively to the utility gained from other perks. On the other hand, the uncertain in-transparent environment of transition increases the incidence of principal-agent problems, giving managers more opportunities to divert funds. Nevertheless, it is difficult to predict what will the managers divert the funds to, they can choose to give less than is optimal for the company and to spend the funds elsewhere, but they can also choose to

---

[25]Firms in the Czech Republic may deduct value of donations to listed causes up to 2% of their tax base, the limit is moved to 5% if the (additional) donations support natural disaster causes. In 2002 and 2003 the limit was shifted to 10% due to floods in 2002 (the 5% in addition had to be in support of the flooded areas). Minimum donation that can be deducted is 2,000 Czk. (The Act on Income Taxes No. 586/1992 Coll. in the wording of its future amendments.)

[26]In both countries donations had to be deducted in the year they were given (different from the U.S.A. with the possibility to carry forward donations above the limit). State owned companies did not have the right to deduct any gifts.

[27]The Act on Income Taxes No. 595/2003 Coll.

increase giving above the optimal level.[28] The final effect of these factors remains to be tested empirically. We divide the hypotheses to be tested into two groups, economic and organizational, as above in Section 2.1.

Economic theories

The economic theories analyze the motivation for corporate charity, the model by Navarro (1988) allows to distinguish between maximization of managerial utility and profit. If we remained in the one-period framework, the significance of the tax rate coefficient would allow for the distinction. Allowing for two-periods, though, makes the analysis more complicated and the predictions are not straightforward. Thus, we omit this interpretation of the tax rate coefficient and focus solely on the importance of the tax rate as such.

We expect that corporations in transition are strongly motivated by maximization of profits, thus, they shift their giving to periods with higher taxes. This results in independent of the framework (one- or two-period model) used. We expect that profit maximization results from the periods of significant instability and uncertainty in the environment that has been here in the past. In addition, this behavior results from the motivation to decrease the tax burden as much as possible, a strong motivation particularly in transition (Hanousek and Palda, 2002).[29] Tax rates in both countries have declined in the periods under consideration, the changes were announced in advance, hence, firms were motivated and able to shift donations to the earlier periods. Changes in the Czech Republic were smaller than those in the SR, thus, we expect lower impact. The most significant changes occurred in Slovakia in 2004, when the tax rate decreased significantly (25% to 19%), deductibility of donations was abolished, and tax assignations were introduced. We, therefore, expect this change to have the most significant effect.

> *Hypothesis 1: The tax rate plays a significant role in the giving decision.[30] The impact of the tax rate was stronger in Slovakia, particularly the change between 2003 and 2004.*

Galaskiewicz and Coleman (2005) suggest that companies optimize their use of the different giving channels, thus, that they have different motivation for the use of different channels. In this study we distinguish two channels of support, sponsoring and giving. The fact that these two channels are subject to a different tax treatment offers initial support for the hypothesis of different motivation. Different impact of the tax rate would offer additional support that the motivation is different. Because giving is treated more favorably in the Czech Republic than in Slovakia, we expect that the preference for sponsoring will be stronger in Slovakia.

> *Hypothesis 2: The impact of tax rate on philanthropic expenditures is different for sponsoring and for giving. The difference is bigger in Slovakia.*

---

[28]We thank Rich Steinberg for pointing this out.

[29]We claim that the firms that engage in philanthropy tend to avoid rather than evade taxes because they are more 'visible' because of their philanthropic activities. If they preferred to evade taxes, we claim that they would not invest in charity and attract unwanted attention. Thus, we do not expect that evasion would make estimation problematic.

[30]The existing studies of corporate philanthropy in the U.S.A. use two measures of the tax rate, average and marginal. The corporate tax rates in Czech and Slovak Republics are constant for all levels of income, but they have decreased in the past years, with some changes in the periods under consideration here.

Organizational theories
This section focuses on the external factors influencing corporate philanthropy. As suggested by the organizational theories we examine the stakeholders with a potential to affect the behavior of corporations.

Size of the company is a typical factor influencing expenditures on philanthropy. This is natural as large companies have more funds available, thus, they also spend more in absolute amounts on charity.

Hypothesis 3: Big companies are more active in philanthropy.

Ownership of the company is another factor that has influence on philanthropy. Namely, it is often claimed that foreign owners bring to their companies corporate culture from their home countries, where philanthropic and CSR traditions are more established. Companies with foreign owners therefore take the lead in philanthropic behavior in transition economies (e.g., Bussard et al., 2005; BLF, 2004). An additional factor increasing the giving of foreign companies may be a higher need to build relationships and goodwill in the foreign country.

Hypothesis 4: Foreign owned companies are more active in philanthropy.

Type of the industry in which the company operates, also co-determines its corporate giving. Firms in services are closer to their customers, which makes their involvement in the community more important and increases also their incentives to participate in philanthropy. Retail firms, on the other hand deal with large groups of consumers making their participation in philanthropy important. These pressures are smallest in manufacturing.

Hypothesis 5: Firms in retail and services are more active in philanthropy than firms in manufacturing.

Firms operating at different levels face different conditions and meet different stakeholder groups. Firms operating at the international level are expected to meet stronger stakeholder groups and operate in an environment with higher expectations on corporate behavior. These factors are expected to increase their engagement. On the other hand, firms operating at the regional level are closer to their stakeholders and the needs of the local community. Which of these forces is stronger is an empirical question.

Hypothesis 6: Level of operation affects philanthropic behavior of companies.

The last factor we want to discuss is location. We assume that the biggest difference exists between the firms in the capital and other regions. There are several factors decreasing philanthropic engagement in the capital: free riding–firms in areas with many other companies tend to free ride on giving of the others (Navarro, 1988), anonymity of relations in large cities—building of relationships and cooperation is more difficult. There are though also factors increasing giving in the capital: better economic performance—companies have more resources to give, higher density of nonprofit organizations—the pressures to give are higher as is the demand for donations. As above, it remains an empirical question to determine which of these forces is stronger.

Hypothesis 7: Philanthropic behavior of firms located in the capital differs from that of firms in other regions.

4. DATA

The data used are the first of its kind in both countries,[31] they were collected using face-to-face interviews by market survey company Median (Median SR in the SR). Data for the Czech Republic were collected in two surveys: the first sample was collected for the Czech Donors Forum in 2004, covering 577 firms over three years (2001-2003), with an over-sampling of large and medium-sized firms.[32] The second sample was collected in 2006, covering 162 firms over five years (2001-2005), focusing entirely on large and medium-sized firms.[33] The Slovak sample was collected in 2005, covering 152 firms over four years (2001-2004). Here, too, large and medium-sized firms are over-sampled.[34] Details about the samples are summarized in Table 2 below.

The focus of our surveys was on quantitative information about corporate philanthropy.[35] The collected data include amounts spent on sponsoring and giving, number of supported entities, supported areas, target groups, and information about the companies (number of employees, industry, geographical area, legal form, level of operation, sales, and income before taxes). We attempted to obtain additional information on the companies but failed because, to induce participation, they were guaranteed anonymity.

It is not possible to obtain any hard data on corporate philanthropy, thus, it was necessary to collect data using surveys.[36] The data, therefore, exhibit typical survey data problems including sample selection—we have data only for the firms that were willing to cooperate. In our case, firms that do not contribute usually do not respond to these questionnaires (Navarro, 1988). Similarly, small firms and firms contributing small amounts do not respond (Helland and Smith, 2003). This problem though is partially addressed in our samples because we cover not only giving but also sponsoring (and assignation in the SR).

Several problems of the samples stem from the specific nature of the studied topic. The major hurdle is quality of the information on giving and sponsoring expenditures, which is often low: the corporations are reluctant to publicize any specific information regarding their philanthropic spending (Múčka, 2005; Kivilo, 2004; Marček and Dluhá, 2002).Low quality of giving data results from the unclear accounting rules that guide giving, particularly giving of material gifts, or services. Often even the companies themselves have problems to distinguish between sponsoring and giving, making reporting problematic. To mitigate this problem the

---

[31]There have been several studies of corporate philanthropy performed in the Slovak Republic (Marček and Dluhá, 2002; Velšic, 2004; NDS, 2005), but the only study asking for amounts spent (for 2001) was the study by Marček and Dluhá (2002). The sample is rather small hinting low willingness to disclose this information (107 respondents out of 194 participating). The only study in the Czech Republic was the survey performed by Donors Forum, we work with this data.

[32]A representative sample would include 98% of firms below 50 employees, providing insufficient information on big firms, which are the most important givers. In addition, the sample included a group of big firms specified by Donors Forum, which may bias the results slightly, even though the sample was made representative afterwards.

[33]It includes only companies with more than 50 employees.

[34]The first Czech survey was performed by Donors Forum, which required an overview of the whole market. We replicated the survey in both countries to obtain additional data but due to limited resources we focused on large firms only.

[35]The original survey in the CR included also a qualitative part about strategies and management of philanthropy (DF, 2004). This part was omitted in both additional surveys.

[36]Giving is tax-deductible in the CR but not in the SR, thus, the tax-office cannot provide the information. Moreover, not all companies claim deductibility, and the tax-office cannot provide individual data. Sponsoring belongs to advertising and PR expenditures, thus, it is not possible to trace the information in accounting books.

surveys emphasized several times the distinction between the two methods of support. To deal with the reluctance to report the specific values respondents were allowed to report the information in intervals. Unfortunately, the first survey in the CR did not give the respondents an opportunity to provide also the exact amount if they would. We corrected this in the additional surveys in both countries, where the intervals were offered only when the respondents declined to provide the exact amount. Data on profit before taxes and sales were reported in intervals as well.[37]

A closely related problem concerns the structure of the reporting intervals used,[38] namely, the first interval (for giving and sponsoring) in the original Czech survey was very broad, up to 200,000 Czk. As a result nearly 79% of the reported giving (company/year) fell into this interval. We corrected this in the additional surveys, where we split the first category into four subcategories, but to maintain the same number of intervals we merged the top three intervals. Throughout the study we work with the different intervals for the different studies, though for comparison we provide also results with common intervals—intervals merged so that they are the same for all three samples. The fact that the respondents had to report the information retrospectively for the last 3, 4, or 5 years may also bias results. The extent of this problem was mitigated by the fact that the interviews were arranged in advance, thus, the respondents had time to prepare.

The last concern we want to discuss regards reporting of profits. If only the firms with profit too low or too high would refrain from reporting them, the estimated regressions would suffer from incidental truncation. The bias depends on the type of firms that did not report their profits—if the firms with low profits do not report, the estimated impact of profits on giving would be biased downwards. However, we are unable to control for the willingness to report this information.

4.1. Structure of data sets

The structure of the samples is summarized in Table 2. This is the structure of the original data collected; for the analysis we merge the two Czech samples[39] and weight the data to obtain a sample representative of the population.[40]

---

[37]None of the surveys asked for the exact amounts of sales or PBT as the used intervals were rather narrow, thus, the information is of sufficient quality.

[38]Two types of intervals were used, one for giving and sponsoring (9 categories), and a second one for sales and PBT (180 categories).

[39]We tested that the merge is possible using the Chow test of equality of coefficients.

[40]Firms in the sample are of various legal forms, more than 80% in all samples are joint-stock and limited liability companies. The fraction of publicly traded companies is negligible because the Czech and Slovak financial markets remain small and inefficient.

Table 2. Structure of the samples

	CR I	%	CR II	%	SR	%
Number of employees						
Less than 50	310	54	-	-	67	44
50 - 250	194	34	108	67	56	37
250 - 1000	48	8	41	25	25	16

Notes: Amounts are in thousands of Czech Crowns, adjusted for inflation with base year							

---

[41]Amounts are in thousands of Czech Crowns, adjusted for inflation with the base in 2001.

[42]Common intervals are used to enable better comparison of the samples. Common intervals are the same in all samples, i.e., they group data from the narrow intervals in the SR and new CR sample to form the big first interval in the original CR sample, and vice-versa for the high categories.

2001. Common intervals (CI) allow a better comparison of the samples. They group data from the narrow intervals
in the SR and CRII sample to form the big first interval in the original CR sample, and vice-versa for the high categories.

We observe that despite the fact that there is a significant difference between the expenditures on sponsoring and giving in the Czech Republic when reported in the original and common intervals, we do not observe this difference in the share categories (*Amount/profit*). This is caused by the fact that even though there is a significant decline in the average expenditures due to the merging of the last three intervals of the original Czech sample, we cannot observe this decline in the share categories because these observations are missing—these firms did not provide the information on their profit. This information is missing only in the largest category (over 50 million Czk); reporting in the other categories does not exhibit significant differences. Thus, the data on the largest donors are excluded from the analysis that work with profit as a variable.

We observe that even though firms in Slovakia participate in sponsoring to a similar extent as firms in the Czech Republic and they also spend a similar fraction of their profit on sponsoring, their participation and spending on giving are significantly lower. Participation in sponsoring and spending as a fraction of profit in CI are the only categories in which we fail to reject the null hypothesis of equality between the countries. The differences in the data reported in the original and common intervals show the biases are caused by the size of the first interval (SR results) and the merging of the last intervals (CR results). Nevertheless, the differences in giving between the countries remain significant also in common intervals, Slovakia remains below the CR. A comparison of profitability shows that profits in Slovakia are significantly below those in the CR (average profit in CR was 227,431, in SR 14,040 thousand Czk). Importantly, the difference is mainly driven by less than 1% of firms with very high profit, which is missing in Slovakia. The result is even stronger when we take into account that the fraction of firms that reported profit was higher in Slovakia, including firms with high profit.[43]

In the Slovak Republic, participation in assignation is slightly (although not significantly) below that in sponsoring but significantly (at the 10% level) above participation in giving. Comparing the fraction to that obtained in the un-weighted sample[44] we observe a downward shift, i.e., small firms assign less often. This could be caused also by the fact that probability of low (zero) profit among small firms is higher—these firms pay no or low taxes and have nothing to assign. Similarly, the level of participation in giving is higher in the un-weighted sample (47%), i.e., small firms participate less in giving. We also compared sponsoring and giving in the years before and after assignation in Slovakia, but we failed to find any significant difference.

We do not have data on the amounts assigned. This question was omitted from the survey as we did not expect any company to assign less than the two percent allowed by law. Though, we asked whether they used the assignations to the full extent, only 9% of companies responded that they assigned less than 2%.

---

[43]More than 70% of firms in Slovakia reported their profit, while the fraction is the Czech Republic is only around 50%.
[44]Available on request.

5. METHODOLOGY AND RESULTS

5.1. Methodology

We analyze two decisions—how much to spend on sponsoring and how much on giving.[45] The panel format of data allows for the accountability of the unobservable firm specific effects using either random or fixed effects specification, REM or FEM. With random effects we impose a strong restriction that the firm specific effects are uncorrelated with the error term, this assumption is relaxed in the fixed effects specification. The fixed effects, however, do not allow for the examination of the impact of the observed firm specific variables (Wooldridge, 2002). We first test for the appropriate specification comparing the pooled OLS regression, REM, and FEM. If FEM proves to be the correct specification, we estimate an additional model to evaluate the effects of the observable firm characteristics of interest (Wooldridge, 2003). The specification is a random effects model with residuals from the fixed effects model as a dependent variable, the explanatory variables are the observed firm specific variables of interest. In this specification, there is no variation in time any longer, all we measure is the 'between' variation across firms.

As discussed in the data section, we need to cope with a typical problem of survey data, sample selection. We can deal with this problem to some extent because we have data for sponsoring and giving—we have information also for firms that did not give but sponsored and vice versa. This makes it possible to employ Heckman's two step procedure (Green, 1993) to account for the potential self-selection of firms. In the first step we estimate the selection equation using probit on the participation (separately for sponsoring and giving) decision. In the second step we estimate the appropriate specification as identified above with the selection parameter λ among the explanatory variables.

The main drawback of FEM is that it cannot account for the fact that data are in intervals, we estimate the models using the middle points of the reporting intervals. Interval regression is possible only in REM—an ordered probit model estimated using maximum likelihood.[46] We therefore estimate the random effects interval regression for comparison. To account for the simultaneity of the choices in giving and sponsoring we estimate also a system of seemingly unrelated equations.

Models explaining the amounts spent on sponsoring or giving exhibit one additional problem: potential endogeneity of profit. The optimal donations depends on the corporate characteristics, profitability being one of them, but, we assume that donations also affect profit of the company. Hence, including profit among the explanatory variables results in an endogeneity problem that should be fixed using instrumental variables. Unfortunately, the data we have at our disposal do not provide any potential instruments.[47] It is, therefore, not possible to test for endogeneity. To avoid the endogeneity problem in our analysis we do not include profit among the explanatory variables. In this way we also avoid the problem of

---

[45]Data about the amounts assigned are not available.

[46]There is not sufficient statistics to estimate conditional fixed effects, the estimates in un-conditional fixed effects are biased (Stata manual).

[47]We created an instrument using the profitability of the industry, i.e., average profit of all other companies in the market. However, the number of companies within industry groups was too small (if we wanted to maintain some industry structure). Thus, the variable did not properly instrument for the omitted profit and we did not use it in the analysis further on.

incidental truncation caused by the potential nonrandom profit reporting, as discussed in the data section above.[48]

5.2. Empirical model

The empirical model is based on the theoretical model from Navarro (1988) and extended for the consideration of organizational characteristics. We examine two specifications, one for the amounts spent on sponsoring and one for giving (in the model we denote them generally philanthropy, *Phil*):

$$Phil_{i,t} = \beta_0 + \beta_1 Size_{i,t} + \beta_2 IndD_i + \beta_3 LopD_i + \beta_4 Capital_i + \beta_5 OwnD_i + \beta_6 FD_i +$$
$$\beta_7 Year + \beta_8 TaxD_i + \beta_9 CRII_i + \mu.$$

We use logarithmic transformation of the amount variables, the dependent and applicable explanatory variables, to get estimates of elasticities. The specifications may be estimated on a merged sample (both countries together) or separately for each country, the choice depends on the similarity of the two countries.

The explanatory variables are:
Size, variable capturing the size of the company, used to normalize the levels of giving (big companies give more in absolute values). Size is measured by two variables: *Sales*, the volume of sales and *NoE*, number of employees.
IndD, dummy variables indicating different industries: manufacturing, retail, and services. They capture possible differences in the reliance on philanthropy across different industries. The industries closer to their customers are expected to give more. We use services as the benchmark group.
LopD, categorical variable indicating the level of operation: international, national, and regional. This variable captures the potential power and expectations of company's stakeholders.
Capital, dummy variable indicating firms located in the capital, Bratislava or Prague.
OwnD, dummy variables indicating different ownership structures: foreign, mixed, and domestic. The variables are expected to captures the differences in the philanthropic culture and behavior of domestic and foreign owners.
FD, dummy variable distinguishing firms with a foundation or a foundation fund. It captures possible strategic philanthropic behavior of a firm, signaling higher engagement in philanthropy.
Year, categorical variable capturing the possible time trend in giving.
TaxD, represents four dummy variables indicating different corporate tax rates. There were three different tax rates in Slovakia, and three in the Czech Republic, see Table 1. Tax dummies are denoted Tax1 SR (year 2001), Tax2 SR (2002-2003), Tax3 SR (2004), Tax1 CR (2001-2003), Tax2 CR (2004), Tax3 CR (2005). Two for each country are included in the regressions, setting the third one as a benchmark.
CR II, dummy variable denoting the additional, second sample for the Czech Republic. Details about the sample are in the data section.

---

[48]Exclusion of profit may cause an omitted variable bias. We compared the coefficients at the other variables in the specifications with and without profit and the differences were negligible, thus, the omitted variable problem does not seem to play a role.

5.3. Results

5.3.1. Participation

In this section we report results on participation in sponsoring, giving, and, in the Slovak Republic, assignation. The sponsoring and giving specifications are used to obtain the estimate of the selection parameter, λ, to correct for selectivity in the expenditures specifications of interest that follow. We tested for the equality of coefficients in the two countries. The hypothesis was rejected and we therefore estimate the model separately for the Czech and the Slovak Republics. We performed a similar test comparing the first and second Czech sample, where we failed to reject the hypothesis of equal coefficients. Therefore, we merged the two samples, but to account for a difference in the levels[49] using a dummy variable denoting the second sample, *CR II*. In both cases we estimated a linear probability model, probit, and a system of seemingly unrelated equations. Here we report, Table 4, only results from probit random effects, because we use it further for the Heckman's selection correction and the fact that results from the other models do not differ significantly.[50]

Several results on participation were summarized in Table 3; we observed that participation of firms in sponsoring was similar in both countries, but the Czech firms gave significantly more often. This offers some support for Hypothesis 2 that sponsoring is preferred to giving in Slovakia. We also observed that only approximately half of Slovak firms participate in assignation, a very low number if we take into account that assignations impose only negligible costs (administrative) on the company. This may be caused by two factors discussed in more detail below: low profitability of firms (positive profits, thus, positive tax dues, are a necessary condition for assignation), and lack of interest in the subject.

Tax1 CR denotes the first tax period in the CR, 2001-2003, Tax2 CR, 2004.

Tax1 SR denotes the first tax period in Slovakia, 2001, Tax3 SR the last one, 2004. See Table 1 for details.

The results summarized in Table 4 offer some support for Hypothesis 3 that big firms are more active in philanthropy. We observe that in both countries size of the company (measured by the number of employees and sales) increases engagement in both sponsoring and giving. Sales have similar effect on both; the number of employees increases giving more than sponsoring. This result is in line with the profit maximization hypothesis because a higher number of employees means higher importance of labor force for profitability, thus, greater pressure on responsible behavior of the corporations towards their employees. Number of employees has a very strong positive effect on giving in Slovakia, suggesting that small companies are involved in giving significantly less often than those in the Czech Republic. This result hints that the philanthropic culture, particularly among small firms, is not as developed in Slovakia as it is in the Czech Republic. Firms with few employees, though, do sponsor and participate in assignation. In summary, small firms seem to be interested in philanthropy, the problem may be in the lack of resources.

The effect of industry, Hypothesis 5, differs between the two countries: in Slovakia firms in retail are the most active in both sponsoring and giving. We do not observe any difference in the participation of firms in manufacturing and services. In the Czech Republic, however, we observe no difference between the industries in giving, but firms in services (the omitted category) are the most active in sponsoring. Thus, we observe that industry indeed affects the charitable behavior of companies though we do not find support for Hypothesis 5 that firms in services participate more with the exception of sponsoring in the Czech Republic. These results suggest that despite the closer link between the firms in services and their customers and the low mobility of these companies, stakeholders lack either power or willingness to induce engagement in philanthropy.

Results regarding the level of operation, Hypothesis 6, show opposite results in the two countries: in Slovakia, firms at the international level participate significantly more in both sponsoring and giving; in the Czech Republic we observe no difference in sponsoring, but local and regional firms participate more in giving. This again suggests that Slovak philanthropic culture lags behind that in the Czech Republic, with philanthropy still being a

domain of large and internationally operating firms. In addition, stakeholders in Slovakia seem to be less powerful, unable to induce participation of firms at the local levels.

The effect of ownership is explored in three categories: foreign, mixed, and domestic. We find weak support for Hypothesis 4 in the Czech Republic, foreign firms engage more in giving. But, Hypothesis 4 is not supported in Slovakia, foreign firms do not differ from firms with other ownerships in giving and they participate less in sponsoring and assignations. This result is unexpected, it shows that foreign firms lag in sponsoring but we cannot conclude that they are the leaders in giving. The lack of difference in giving in Slovakia may as well be caused by the fact that all companies are similarly inactive rather than active. These results, however, do not yet show the extent of their engagement.

The effect of being located in the capital, Hypothesis 7, is negative: firms in the capitals engage significantly less in philanthropy than firms in the other regions. We cannot distinguish what drives this result, whether free riding, as the number of firms in the capitals is higher than in other regions,[51] or the anonymity of the city, which could make it more difficult to establish partnerships.

Finally, we observe a strong positive impact of time on participation in the Czech Republic. This trend is missing in Slovakia. We observe no significant impact of the changes in tax rates contrary to our expectations particularly in Slovakia (Hypothesis 1), though the missing growth in Slovakia offers partial support for the negative impact of these changes.[52]

5.3.2. Expenditures on philanthropy

Tables 5 and 6 summarize results from the main specifications for the expenditures on sponsoring and giving.[53] To account for the potential selection bias we include among the explanatory variables Heckman's lambda obtained from the participation equations summarized in the previous section. As in the previous analysis we merge the two Czech samples and analyze Slovakia separately. We used the Hausmann test to compare the suitability of the fixed and random effects, the test rejected the null hypothesis of independence of the firm specific effects and error term in both specifications; thus, we estimated FEM with the results summarized in Table 5.[54] In order to test the hypotheses regarding the observed firm characteristics we estimated a random effects model on the residuals from the fixed effects regression as described in the methodology section above. Results from these estimations are summarized in Table 6.[55]

---

[51]www.czso.cz, www.statistics.sk

[52]We suspect that corporate philanthropy in Slovakia has similar 'potential' to grow as in the Czech Republic, due to the favorable economic evolution, GDP growth, as well as development of infrastructure supporting corporate philanthropy as summarized in section 3 above.

[53]We have no information on expenditures on assignations. The reason was that assignations are fixed to be below 2% of due taxes with no incentives to assign less than 2%.

[54]We also tested for suitability of panel data estimation versus stacked pooled data estimation, the test rejected the pooled estimation.

[55]We provide only results from the fixed and random effects, the results from the control treatments (interval regression, seemingly unrelated regression) did not differ significantly and are available on request.

No. of obs.	1062	312	1183	229

Standard errors are in parentheses.
*** denotes significant difference at 1%, ** at 5%, * at 1%

First, we observe that the coefficients at Heckman's lambda are insignificant in Slovakia, i.e., the selection bias in this case does not present a major hurdle. Therefore, in the decomposition regression below we report results from the models without correcting for the selection bias.[56] The coefficients in the fixed effects specification are insignificant even though the explanatory power of the models is rather high (as measured by the *Adjusted R^2*). The main explanatory power, therefore, comes from the firm specific characteristics, which we cannot observe in this specification but explore below in the regression on residuals.

We do not identify any significant differences either between giving and sponsoring or between the two countries. Sales have no effect on the expenditures on philanthropy with the exception of giving in the Czech Republic. Thus, if a firm chooses to participate in philanthropy then its expenditures do not depend on its size and, possibly, financial situation.[57] We do not observe any time trend in any of the specifications. This is caused by the fact that growth already appears in the participation decision—once a firm decides to participate in philanthropy its expenditures remain stable in real terms.

We fail to support Hypothesis 2, that there is a difference in the effect of tax rate on sponsoring and giving because the tax rate does not have a significant effect on either of the amounts spent. Moreover, observing no significant coefficient at *Tax3 SR*, a dummy variable capturing the 2004 change in the legislation, we fail to support Hypothesis 1 that giving in Slovakia decreased significantly after this change. The only evidence we have to this end is

---

[56]We do not provide results from the fixed effect estimation as they are similar to those provided.
[57]Sales are positively correlated with profitability.

the missing growth of participation (contrary to the Czech case) described in the previous section.

To test the organizational theories' hypotheses we turn to the random effects model estimated on the residuals from the fixed effects regression, Table 6.[58] When looking at the results it is necessary to keep in mind that we analyze only the information for firms that gave or sponsored (in at least one year) and reported the information on their sales.

Size, measured by the *Number of employees*, has no effect on the expenditures on sponsoring. In giving, however, we observe an opposing effect in the two countries: in the Czech Republic small firms give more than firms with many employees, the opposite is true in Slovakia. Results are in line with those regarding participation: participation in sponsoring increases in the financial size of the company, the number of employees has positive effect only in the Czech Republic. Participation in giving, on the other hand, increases more significantly as the number of employees increases. The effect is stronger in Slovakia, where a high number of employees increases also expenditures. This result further supports the hypothesis that the development of philanthropic culture, particularly among small firms, is lagging in Slovakia.

The impact of ownership differs between sponsoring and giving: while ownership has no effect on expenditures on sponsoring, foreign owned firms spend significantly less than the domestic ones on giving. Thus, foreign firms are not the leaders in philanthropy. In addition, foreign owners are more profit oriented, preferring sponsoring to giving as a cheaper and simpler tool of support. To further test this hypothesis in Slovakia we added additional explanatory variables to the regression—interaction terms between the year 2004 and ownership, as the change in 2004 was expected to have the strongest effect on philanthropy. Results are listed in the third column of Table 6 for both sponsoring and giving. The results, indeed, show support for the expectation. While the domestic firms did not change their behavior significantly in 2004, foreign firms did—they increased expenditures on sponsoring, the effect on giving is negative but not significant. This result suggest that sponsoring and giving are substitutes and the profit-oriented firms shift towards the cheaper one.

Standard errors are in parentheses.
*** denotes significant difference at 1%, ** at 5%, * at 1%, (*) at 11%.
SR 2 denotes additional specification to examine the impact of the change in 2004 on different ownership forms.

We observe no difference in spending on sponsoring among industries; firms in retail, and in Slovakia also those in manufacturing, spend less on giving. Thus, we partially support Hypothesis 5 that firms in services give most (though they give least often), followed by firms in retail and manufacturing. The difference between sponsoring and giving may result from their different nature, giving being a result of stakeholders' pressures and their closeness to the company, sponsoring being aimed at attracting customers, similar to advertising.

The level of operation, Hypothesis 6, matters only for the expenditures on sponsoring. In the Czech Republic regionally operating firms spend more on sponsoring, in Slovakia they spend the least. We observe no differences in giving. The absence of a difference in expenditures between firms at the international and local level is positive, though, we have to keep in mind that the local firms in Slovakia do participate significantly less often.

Regarding Hypothesis 7, we observe that firms in Prague spend more on giving than firms in other regions. We observe no other difference. We are not able to identify the specific motives for such behavior; one possible reason is the positive correlation between profitability and location in Prague. As we do not control for profits in the specification, location might capture some of this effect.

We observe that levels in the second sample are significantly below the levels in the old one. The Chow test of similarity of coefficients failed to reject the hypothesis of no difference, the only difference is in the level captured by *CR II*. This is possibly caused by the non-random

choice of some participants in the original Czech survey, the important donors. Even though the additional companies were chosen so that the sample would become representative, inclusion of these major donors may cause the upward bias in the level of giving.

To address the problem of the bad structure of the first interval in the original Czech sample we estimated the same specifications using common intervals, in addition, we did not use the middle point of the first interval but the average of the observations obtained from the additional samples. This estimation was used to observe the effect of the merging of the first interval. The results from this control treatment did not differ significantly from the results presented above, with one exception: the coefficients at two tax dummies (Tax2 CR, Tax1 SR) were significant.[59] This difference suggests that merging the intervals may emphasize differences that would otherwise remain unobservable. On the other hand, the large intervals were not created with any theory in mind, thus, the observed effect is likely to be artificial choosing another merging of intervals would probably lead to a different result. Nevertheless, the obtained results offer some support to the hypothesis that there is a difference in the motivation for sponsoring and giving.

5.4. Discussion

In this section we briefly discuss the problems with the performed analysis and describe what would an ideal data set look like.

The official source of data on corporate philanthropy would be the tax office, which obtains the information on corporate giving when firms claim deduction on their donations. There are, however, several problems with such data. Most importantly, these data are usually not available at the individual firm level, but only in aggregates. But, even if it was possible to obtain the individual data, they would not provide the complete picture of corporate philanthropy—first, they do not capture sponsoring, which enters the books as costs within the broader category of spending on promotion. In addition, evidence from the U.S.A. shows that small firms in particular often do not claim deductions on their donations, biasing the picture further (Muirhead, 1999).

Therefore, it is necessary to collect the data using a survey, a method with several drawbacks that need to be accounted for. The first problem arises with sampling: data collected in surveys are subject to sample selection such that information is only available for firms that agree to participate. This problem can be addressed using methods such as the Heckman two-step procedure (Wooldridge, 2002), which imposes additional restrictions on estimation. Ideally, to ensure identification it is necessary to have additional explanatory variables, otherwise the estimation hinges on the assumption of normality of the distribution and the fact that the selection estimation is nonlinear.

Quality of the collected data poses another problem. Firms are often not very forthcoming in reporting the expenditures on sponsoring or giving. This bias though seems to play only a minor role in our study: once firms agreed to be surveyed they were willing to report the specific amounts as well. In the Slovak sample 63% to 70% of the firms that gave were willing to report the specific amount given (the responsiveness varied over time). The rate was even higher for sponsoring, on average 75% reported also the specific amount.

---

[59]Results from this estimation are available on request.

Responsiveness may vary with the survey method used, only 55% reported the amounts in survey reported in Marček & Dluhá (2002).

There remains a significant fraction of firms that prefer to report the information in intervals. Here, it is necessary to design the structure of the reporting intervals so that the survey does reveal as much information as possible. Ideally, the survey should be designed in steps. First, there should be a preliminary search for the distribution of giving. Then, the intervals for the actual survey should be designed to best capture the information obtained.[60]

An important problem with the present data set is the promised anonymity of the participating subjects, which makes their later identification (even for research purposes) impossible. Thus, it is necessary to ensure sufficient identification of subjects to enable merging with additional information from other data sources. It is possible, to some extent, to substitute this by asking additional questions in the survey, but, it may increase the costs of surveying. In addition, it is always valuable to be able to compare data from different sources to ensure their quality.

6. CONCLUSION

In this study we analyzed corporate philanthropic behavior of firms in two transition countries, Czech Republic and Slovakia using survey data of 739 firms in the CR and 152 in Slovakia. The results reveal that despite the long common history of the two countries there are significant differences in the current philanthropic behavior of firms. Namely, firms in the Czech Republic give more often and give significantly more than firms in Slovakia. In addition, giving in Slovakia is more prevalent among large firms operating at the international level, while in the Czech Republic smaller, regional firms also participate. These differences between the countries seem to be caused by the differences in profitability, further enforced by missing 'leaders' in Slovakia, i.e., large Slovak firms give less than large Czech firms. The differences in sponsoring are of a smaller extent.

One of the major questions of this study was the impact of taxes—did the decreasing corporate tax rates affect corporate philanthropy? If we looked only at the significance of tax variables the answer would be no, none of the changes had significant impact on either sponsoring or giving. But, these results need to be considered with caution because the changes in the tax rates in the Czech Republic were rather minor. In Slovakia, the changes were more significant, in particular the change in 2004. However, even this change does not have significant impact on the giving. Unfortunately, the insignificance of this coefficient may be caused by the nature of the data which does not allow to clearly distinguish the year specific effects from the impact of the changes in the tax rate. The fact that while in the Czech Republic we observe a significant growth in participation in both sponsoring and giving and participation in Slovakia has remained stable despite significant economic growth and activities in support of corporate philanthropy suggests that the impact of the tax change in the year 2004 may be negated by the potential growth.

To further evaluate the impact of the tax change in 2004 in Slovakia we analyzed it separately for firms with different ownership. We observed that while the change had no effect on firms with domestic or mixed ownership, it had a significant effect on firms with foreign owners

---

[60]We implemented this procedure in the additional surveys. We obtained the data for the CR after they have been collected, i.e., we were not able to influence the design of this survey.

that shifted their support to sponsoring in 2004, suggesting that foreign firms are better in optimizing their tax benefits than domestic companies. In general, though, we did not find support for the hypothesis that firms with foreign capital give or sponsor more. We observed that foreign owned firms in the CR give more often, but their expenditures are below those of other firms. Participation of foreign owned firms in Slovakia is significantly below participation of domestic firms in sponsoring. Their expenditures in sponsoring are similar, but they are significantly below those of domestic firms in giving.

We failed to support our hypothesis regarding higher engagement of firms in services with the exception of sponsoring in the CR. Their expenditures in giving, however, are the highest in both countries. This may result from the fact that profitability of firms in services is the lowest when compared to the other industries, having negative effect on participation. On the other hand, once they start to engage in philanthropy they, possibly because of their close relationships with stakeholders, give more.

1. INTRODUCTION

1.1. Corporate responsibility in context

Successful companies in the new economy no longer frame their activities exclusively in terms of the goal of profit maximization. Instead, they take account of the total impact of their activities on society and on the environment, in terms of the 'triple bottom line' of people, planet and profit (Harrison, 1997). These companies are no longer oriented only to shareholders in the narrow sense but, rather, seek effective engagement with all of their stakeholders, both internal, including their employees, and external, including their suppliers and consumers. They are committed to a strategic management approach which moves from short-term interactions based on expediency and opportunity, to longer-term partnerships based on shared values, mission, and objectives.

In recognition that long-term survival is increasingly concerned with the management of risks and the protection and enhancement of reputation (Lewis, 2003; Sagar and Singla, 2004), such companies build long-term relationships with significant publics, including policy

makers, journalists, investors, business associations, consumer and environmental protection groups, other non-governmental organizations, and front-line communities. The see their 'license to operate' in terms of their stated commitments to, and performance in, the fields of human rights, labour standards, environmental stewardship, community development, consumer protection, corporate governance, stakeholder consultations, and the screening of suppliers on ethical grounds.

Whilst 'modern' notions of responsible and ethical business can be traced back over fifty years (Carroll, 1999; 268), the fields of 'corporate social responsibility', 'sustainability' (Le Jeune, 2004), 'corporate citizenship' (Habisch, 2003) and 'stakeholder engagement' (Haas, 2003) have evolved rapidly in the last decade, reflecting increased scrutiny of companies' practices, and demands for more responsible, accountable, and transparent behaviours (Waddock; 8). In a sense, the 'raising of the bar' of corporate responsibility by bringing it into the public domain (Klein, 2001; ch. 17) has had a range of effects in terms of companies' commitments above and beyond shifts in the legal and regulatory framework. Not the least important of these has been a more 'holistic' sense of corporate responsibility replacing a rather narrow concern with corporate giving to 'good causes'. Corporate philanthropy has, itself, been changed in this process, to be more concerned with longer-term partnerships (Saiia, Carroll et al, 2003). In addition, sustainability practices are now more likely to be integrated into the overall governance of a company than to be the responsibility of one department or to be seen only as a part of the company's public relations efforts.

Increasingly, companies are seizing the opportunities which responsible behaviour brings in terms of building consumer loyalty, being an employer of choice, retaining a skilled and motivated workforce, attracting quality investors, introducing clear, coherent and effective management structures and business procedures, and maintaining a strategic focus. Indeed, almost coming full circle, it is now suggested that responsible behaviour is correlated positively with corporate financial performance (Little and Little, 2000; Moore, 2003) through a mixture of operational and ecological efficiencies, stimulating a culture of innovation, recognizing new market opportunities, and enhanced reputation and brand loyalty.

None of this is inevitable, however. There is a need to situate companies' behaviour in its wider social, institutional and historical context. The structural and cultural settings in which companies operate vary considerably across space and time, and set limits, or act as constraints, to social action. Progress over time can be seen in terms of Dunphy *et al's* 'three waves' of sustainability from a first wave in which companies move from 'rejection', through 'non responsiveness' to 'compliance'; through a second wave of 'efficiency' and 'strategic pro-activity'; to a transformative third wave of a full commitment to sustainability (Dunphy *et al*, 2003; 15-16). The danger here is that this movement is seen as evolutionary, path dependent and automatic, regardless of context. In fact, the model itself seeks to bring agency back in, since it is the choices and actions of key people within companies, termed 'the dominant elite' (ibid.) which makes sustainability possible. The development and maintenance of sustainability is likely to be a complex product of structures, institutions, organizational culture and human agency, perhaps best expressed in Randell's 'cross-level' framework in terms of the interaction between institutional environment, organizational identity and champions' tactics (Randell, 2002; 66).

Dunphy *et al* (2003) consider that progress towards sustainability requires transformational change in organisational culture and behaviours, with sustainability becoming central to vision, strategy and action. Respected leaders who 'walk the talk' are critical in this regard.

Their emphasis on role model leadership is widely endorsed (Kotter, 1996; Binney and Williams, 1997; Elkington, 2001; Courtice and Swift, 2002; Holliday, Schmidheiny and Watts, 2002; Doppelt, 2003; Lawson and Price, 2003; Grayson and Hodges, 2003; Harvard, 2005; Kellerman, 2006). New kinds of management competences, which can be termed 'sustainability competences', combining attitudes, values, knowledge, skills and actions, are needed to develop and maintain participatory processes, effective, empowering governance structures, and incentives and feedback loops to institutionalise and progress change. Sustainability competences are, therefore, at the heart of a modern 'learning organisation' (cf. CSR Europe, 2003).

Sustainability is, perhaps, best conceived sociologically as a field (cf. Bourdieu, 1977) composed of relatively autonomous sets of practices, institutions, and techniques, and peopled by managers, consultants, academics, activists and policy makers who become 'authorised agents' (Shamir, 2004; 671). These policy fields create a space for new sets of discursive strategies in which critical pressures are deflected and redefined as opportunities. Whilst all fields, to an extent, technicise and depoliticise complex power relations, the more interesting question becomes the degree of 'fit' or lack of it between sustainability and other kinds of management competences, in the context of an uneasy tension between creative innovation and 'tick box' type management systems.

1.2 Sustainability Reporting

Just as the 'bottom-line' of profit has required ever more sophisticated kinds of financial reporting, the 'triple bottom line' is not complete without reporting on companies' environmental and social impacts and activities. Reporting in this area began in earnest only recently. As more companies report there has, also, been a trend towards integrated sustainability reporting, replacing the previous practice of separate environmental reports, which, themselves, have a longer history, and social reports. In addition, as with financial reporting, a number of reporting standards, frameworks and indicators have been developed to enable companies to report on their sustainability practices in a way which allows for comparison over time and across companies and sectors. Reporting is, in many ways, the most important link in the chain in terms of communicating performance and intentions to stakeholders in a transparent and accountable form.

Hence, the Global Reporting Initiative, now the generally accepted framework for sustainability reporting, defines sustainability reporting as "the practice of measuring, disclosing, and being accountable to internal and external stakeholders for organizational performance towards the goal of sustainable development" (GRI, 2006; 3). The recently issued third version of their reporting guidelines applies a sophisticated, holistic framework for reporting in terms of three types of disclosures: strategy and profile; management approach; and performance indicators; together with a wide range of reporting principles including materiality; stakeholder inclusiveness; sustainability context; completeness; balance; comparability; accuracy; clarity; and reliability (GRI, 2006; 8 – 17). The framework continues to allow for self-declaration in terms of the level of reporting used, combined with preference for external assurance by the GRI or another quality assurance provider. The new version of the GRI guidelines includes seven core and two additional economic performance indicators; seventeen core and thirteen additional environmental performance indicators; and twenty one core and ten additional societal performance indicators in the fields of labour practices and decent work, human rights, and society.

The latest triennial survey of corporate responsibility reporting by KPMG (2005) covers the global top 250 companies in the Fortune 500 index (G250) and 100 top companies in 16 countries (N100). It shows a considerable increase in reporting since 2002, with 52% of G250 and 33% of N100 companies issuing separate reports in 2005, compared to 45% and 23% respectively, in 2002. A more dramatic increase occurred in terms of the proportion of companies issuing full sustainability reports, from 14% to 68% of G250 companies and from 12% to 48% of N100 companies (KPMG, 2005; 9). Reporting is most common in Japan and the UK, and in industrial sectors with a relatively high environmental impact. G250 reporters most often cited economic and ethical factors as driving reporting, including innovation and learning, employee motivation, and risk management and reduction. The survey revealed that social and economic reporting remains 'superficial' compared to environmental reporting, and that both corporate governance and stakeholder consultation remain under emphasised (ibid; 5).

Thus far, there has been greater emphasis on the 'what' and the 'how' of sustainability reporting, and much less attention either to the 'why' or, even more importantly, to the 'what for', in terms of the value added of reporting. Research by CSR Europe and Accountability addresses the impacts of reporting framed in terms of six hypotheses, namely: that context matters; that pressure, strategy and values drive reporting, with pressure less important over time; that reporting aims to change perceptions but that changes in stakeholder behaviour are harder to assess; that the 'visibility' of reporting diminishes over time as the technical quality improves; that beyond a 'critical point', stakeholder perceptions can only be changed by changes in organizational culture and business systems; and that effective reporting requires diverse pathways for diverse external stakeholders (CSR Europe and Accountability (2002); 7 − 8).

At the level of theory, Zambon and Del Bello have attempted to suggest how the issuing of a dedicated sustainability report plays a subtle active role, both by substantiating and increasing the significance of certain key concepts, and in terms of affecting the company's actions and building perceptions amongst managers and stakeholders about the company's performance (Zambon and Del Bello, 2005; 134 − 135). They suggest that "it is the ensemble of … discretional choices that makes it possible for the stakeholder oriented reporting to translate concepts and implemented activities into company-specific narratives, structures and data, thus permitting this document to play an active role in the management-driven representation of stakeholder responsible ideas and behaviours". (ibid; 139.)

2. SOCIAL RESPONSIBILITY AND SUSTAINABILITY REPORTING IN CROATIA

2.1 CSR in the Croatian Context: legacies, transition, and institutions

Whilst there is a massive literature on corporate social responsibility in the developed world (see above), and an emerging literature regarding social responsibility in the developing world (UNIDO, 2002; Utting (ed.), 2002; Nelson and Prescott, 2003; Whitehouse, 2003), there is still very little research or analysis on CSR in the post-communist transition countries of Central, Eastern and South Eastern Europe (IBLF, 2002). In any case, this literature is of limited use in exploring the development of CSR in Croatia since the broad transition context has to be understood alongside the specificities of war and independence, on the one hand, and the legacy of Yugoslav 'self management' socialism, on the other. One of the first, and

still most often cited, surveys of CSR in Croatia (Bagić, Škrabalo and Narančić, 2004) suggests that the specific 'worker's self-management' form of Yugoslav socialism, notwithstanding its rhetorical function and noted inefficiencies, introduced the value and practice of participation into corporate managerial processes, such that "the current endorsement of teamwork and stakeholder consultations in the Croatian business community seems to be a combination of contemporary Western approaches to quality management and corporate governance with this older legacy" (ibid; 28).

In part as a result of war and the break-up of Yugoslavia, Croatia experienced a kind of 'delayed' or 'extended' transition, with war lasting from 1991 to 1995; full territorial integrity not achieved until 1998; and the full consolidation of democracy not achieved until the election of a more internationally open coalition government in January 2000, committed to the goal of EU membership. The transition from socialism to capitalism, however, began in 1991, under conditions of political instability, with a wave of privatization labelled by a leading Croatian economist as "legalized robbery through different forms of fictitious or politically dictated transactions" (Baletić, 203; 287). Croatia, not unlike earlier transitions in Latin America, and akin to parts of South Eastern Europe and the former Soviet Union, developed a kind of 'crony capitalism' which was "characterized by the dominance of insider interests, extreme clientelism, non-market based financial sector allocation, and a close link of the state and government with entrepreneurs and the financial sector" (Bićanić. n-d; 1), leading to "a large institutional and democratic deficit" (Bićanić and Franičević, 2003; 16).

The dismantling of 'crony capitalism' in the new millennium had to deal with this legacy in terms of the dubious reputation and low public esteem and legitimacy of the 'early winners' of privatization, many of whom exhibited a rather curious form of charismatic business leadership, in the cause of 'speculative entrepreneurship' which tended to crowd out 'productive entrepreneurship' (ibid; 19), and led to "arbitrariness, inefficiencies and various forms of ethically questionable behaviour" (Račić and Cvijanović, 2004; 429). The private sector still only accounts for some 60% of Croatia's GDP, little changed since the late 1990s (World Bank, n.d.), and there is considerable industrial concentration, with the top 400 companies, representing 0.6% of all registered companies in Croatia, accounting for 51.5% of pre-tax profits, 49.7% of gross revenue, and 33.4% of those employed in 2005 (Privredni vjesnik, 2006; 14; Note: the survey does not include the banking and financial services sector).

There remains a lack of a clear and consistent enabling legislative and policy environment for socially responsible business practice in Croatia with little dialogue, beyond the 'formal and tokenistic' (Gregory and Tafra, 2004; 14), between businesses and government such that there is a rather *ad hoc* combination of over-regulation in some spheres of activity and under-regulation in others. In addition, this 'regulatory deficit' is compounded by a 'watchdog deficit' with little or no tradition of organizations in civil society systematically monitoring the actions and activities of Croatian businesses (Bagić, Škrabalo and Narančić, op. cit; 29 and 56-57), although a significant number of developmental NGOs are involved in cross-sectoral partnerships with businesses. The survey pointed to company ownership structure, size, industry sector, and leadership capacity as key factors affecting sustainability performance in Croatia, suggesting that the main areas of good practice could be found in corporate giving and community involvement, on the one hand, and core business practices, including quality standards, human resource development, and eco-efficiency, on the other (ibid; 34-36).

Interestingly, a second edition of the report, some two years later (Bagić, Škrabalo and Narančić, 2006), charts a paradigm shift, from low level attention to the issue of CSR to the now almost ubiquitous reference to 'social responsibility' in business conferences, in sections of the media, and in training activities (ibid; 6). Crucially, there has also been a concomitant expansion in the size, sophistication, and impact of, and inter-relationship between, institutional support structures for corporate social responsibility in the same period. The Croatian branch of the World Business Council for Sustainable Development (HRPSOR) was founded in 1997 by leading Croatian businesses as a membership organization to promote sustainable development in the private sector. It now has thirty three members and, under a dynamic new leadership, has shifted its focus towards more holistic understandings of sustainability and, in particular, to the promotion of sustainability reporting based on the GRI indicators (http://www.hrpsor.hr). In addition, following a large multi-stakeholder conference and set of activities under the labels 'Agenda 2005' and 'Agenda 2006', the Croatian Chamber of Commerce, following its publication and promotion of a Code of Business Ethics, has established a Community for Corporate Social Responsibility within its Sector for Industry. The new preface to the CSR survey also notes a large number of, mainly externally-funded, time-limited, projects and programmes promoting CSR in Croatia, involving, amongst others, UNDP and UNIDO, AED and USAID, IBLF, the Croatian Association of Business Consultants, and MAP Savjetovanja.

Whilst corporate giving remains the most visible of companies' CSR activities, the last two years have seen the development of more strategic approaches in this area, including an increase in public grant competitions, the establishment of Foundations, and more long-term partnerships, such as those involving UNICEF and a range of leading Croatian companies (http://www.unicef.hr) . The main findings of the 2003 survey on CSR in Croatia, however, remain relevant today, namely that: "Although different aspects of CSR are advocated and implemented in the Croatian business sector, most of them are not strategically structured, and existing practices are not regularly reported" (Bagić, Škrabalo and Narančić, 2006; 7). The 'sustainability field' in Croatia has been strengthened, in terms of inter-relationships within the field, and now consists of a core of business leaders, academics and researchers, consultants, international actors, and local NGO activists engaged in a large number of inter-linked activities. The impact of the field on businesses outside it, however, has been slower to develop and has not yet, we would argue, reached a critical 'point of no return' in which even the majority of the larger enterprises in Croatia consider sustainability practices as a part of their 'license to operate'. In addition, the impact of the field on small and medium enterprises remains rather limited.

2.2 Sustainability Reporting in Croatia: leadership in practice

As might perhaps be expected, what is true for CSR and sustainability in general in Croatia is even more the case in terms of reporting which remains significantly under-developed. HRPSOR, which has led the campaign to promote reporting in Croatia, lists only ten companies which have reported on their environmental and/or social performance in stand-alone reports. As Table 1 below shows, seven of the ten are HRPSOR members, and two others, INA and HEP, are the two leading Croatian companies in terms of revenue. The third non-HRPSOR member company listed, *Petrokemija d.d.*, issued a report on its environmental performance some time ago (the link from HRSPOR's web site no longer works), but has not maintained or expanded its reporting (the company's web site shows only limited environmental data). Only five of the ten reporters have used the GRI guidelines, beginning with Coca-Cola in 2003 and INA in 2004, joined in 2005 by Zagrebačka Banka with its social

report. Coca-Cola issued the first full sustainability report in 2005, using the guidelines, to be joined a year later by Podravka and, to a limited extent, by PLIVA.

Table 1. Companies' Environmental, Social and Sustainability Reporting in Croatia

Company	Industrial Sector	Ranking 2005	2005 Revenue in HRK***	No. of employees 2005	Types/titles of reports (date published)	GRI Used?	HRPSOR member (from)
Coca-Cola Beverages Hrvatska d.d.	Non-alcoholic beverages	70	863,012,234	796	Environmental (2002) Social (2003) Sustainability (2005)	Yes (Social and Sustainability)	Yes (2000)
Hartmann d.o.o.*	Packaging materials	-	92,000,000	180	Sustainability 2004 (2005)	No	Yes (2006)
Hrvatska Elektroprivreda d.d.	Energy	2	9,393,082,901	413	Environmental 1999-2000 (2001) Environmental 2001-2002 (2003) Environmental 2003-2004 (2006)	No	
Holcim (Hrvatska) d.o.o.	Construction materials	147	441,676,713	240	Sustainability 2004 (2005)	No	Yes (1997)
INA – Industrija nafte d.d.	Oil	1	20,050,286,405	10,057	Environmental 96-97 (1998) Environmental 1998 (1999) Environmental, Health & Safety 2002 (2003) CSR 2003 (2004); CSR 2004 (2005); CSR 2005 (2006)	Yes (CSR 2003-)	No
LURA d.d.	Food industry	14	2,063,950,219	1,556	Environmental 1998 (1999) Environmental 2001 (2002) Environmental 2002 (2003) Environmental 2003 (2004)	No	Yes (1998)
PLIVA Hrvatska d.o.o.	Pharmaceuticals	9	3,100,693,499	1,990	Sustainable development 2003 (2004); Sustainable development 2004 (2005); Sustainable development 2005 (2006)	Yes (latest report partly)	Yes (1997)
Podravka d.d.	Food industry	21	1,799,633,636	4,005	Sustainable development 2003 (2004); Sustainable development 2004 (2005); Sustainable development 2005 (2006)	Yes (latest report)	Yes (1997)
Petrokemija d.d.	Fertilizer production	24	1,645,204,902	2,695	Environmental 2003 (2004)	No	No
Zagrebačka banka d.d.**	Banking and finance	-	1,098,000,000	4,400	Social 2004 (2005)	Yes (Social)	Yes (1997)

Comparing the reports shows a wide variation, even amongst those using the GRI guidelines. In particular, this variation can be found in terms of the use, or not, of external verification and in the degree of detail regarding priorities for the future and monitoring and follow-up of these. In addition, issues of stakeholder consultation and of corporate governance structures and risk management arrangements, receive, at best, cursory treatment, itself, as noted above, a reflection of wider reporting trends. Reporting companies are concentrated in sectors with a high environmental impact (such as energy, cement, packaging, and fertilizers) and/or in highly competitive sectors (the food and drinks industry). Thus far, only one bank has produced a social report.

Research carried out by the Zagreb School of Economics and Management in 2005 (Šulenta, Koričan and Mušura, 2006) surveyed the on-line and annual reporting of forty eight companies, including all those listed on one of two Croatian stock exchanges, together with public utility companies and leading banks and financial institutions. Using a methodology developed by the East-West Management Institute, companies' performance is rated against what a foreign investor would want to know about corporate governance and CSR activities. Five of HRPSOR's ten reporters (Coca-Cola, Hartmann, Holcim, Lura, and Petrokemija) are not included in the survey.

The top five companies in terms of CSR reporting, combining scores for corporate governance, environmental and social reporting, were: HEP (19/30 points); INA (19 points); Ericsson Nikola Tesla (18 points); PLIVA (18 points) and T-HT Hrvatski Telecom (12 points). Three of these are HRPSOR reporters and one other (Ericsson Nikola Tesla) is a founder member of HRPSOR and widely recognized for its leadership on CSR. Two other HRPSOR reporters, Podravka and Zagrebačka Banka, appear in the top ten in terms of on-line reporting, in second and joint fifth place, respectively. The report notes general improvement in reporting between 2004 and 2005, including the issuing of stand-alone CSR reports and the use of the GRI guidelines. Importantly, however, Croatian companies still lagged behind their Central and Eastern European counterparts and, whilst, 92% of companies surveyed had some CSR information on their websites, and 44% in their annual reports, only 13% (6 companies) issued a CSR report.

Recalling Randell's 'cross-level' framework cited above, the low level of reporting appears, in part at least, to be related to the institutional environment. This is apparent at the macro-level in terms of being a transition country. Indeed, it is notable how many of the leaders in one form of sustainability reporting or another are wholly owned by foreign, Western companies, in partnership with such companies, quoted on Western stock exchanges, and/or active in Western markets. It is also apparent at the micro-level in terms of company size and sectoral significance.

Crucially, whilst institutional support for CSR has been growing in Croatia, support for reporting is much more recent, with the GRI guidelines only very recently existing in an official Croatian language translation. The conditions are emerging, however, for greater emphasis on reporting, since Zagreb was one venue for discussion of the third generation of GRI guidelines and will be amongst the first to have an official translation. In addition, there is a growing number of CSR consultants and peer support structures are being developed to aid the next generation of reporters. The significance of organizational identity is more complex although leadership in corporate governance and in corporate philanthropy appears to be relevant, with even leading Croatian companies still operating within Dunphy *et al*'s

'second wave' of sustainability behaviour. The individual level of 'champion's tactics' also appears important as, in many of the top reporters, a small number of managers within the company, often active in wider debates about the role of business in society, appear to have been driving both sustainability competences and reporting.

2.3 For a reflexive comparative case study methodology

In the absence of a body of research evidence on sustainability reporting in Croatia, we chose to look in depth at the reporting practices of two Croatian companies, Coca-Cola Beverages, Hrvatska and Zagrebačka Banka in order to gain a deeper understanding of the motives for reporting and the impact of reporting in terms of the development and spread of sustainability competences. The two companies were chosen as a result of our familiarity with, and direct involvement in, their reporting, rather than in terms of any 'representative' qualities. In each case, our own knowledge and awareness has been complemented by a re-reading of the relevant reports and in-depth interviews with the person responsible for the company's reporting and, in the case of Coca-Cola Beverages, Hrvatska, a member of the senior management team. Time and access constraints led to the cancelling of a planned interview with a third Croatian company.

The comparative case study method (CCSM) used here is appropriate, in particular, when researchers have substantial knowledge of each case, within a sub-sample which is itself small. Rather than testing explicit hypotheses, CCSM seeks to formulate, elaborate and refine concepts which can be utilized, later, in larger studies, to test hypotheses and develop theory. The approach explores 'configurations of characteristics' seeing how they fit together in each case and how they differ across cases (Ragin, 1987 and Ragin, 2000). In this study, we move towards a merging of CCSM with Dvora Yanow's plea for more 'reflexivity' in organizational studies which eschews false 'objectivist' claims and, instead, re-inserts the self as a form of 'interpretative authority' into texts. Above all, reflexive CCSM asserts that "interpretative methods are no less methodical and systematic" (Yanow, 2001; 60) than more 'traditional' or 'mainstream' social scientific methodologies. The case studes can, therefore, be built on in subsequent work with a more representative sample of companies, in order to render our findings here generalisable within Croatia.

3. CASE STUDIES

3.1 Coca-Cola Beverages Hrvatska d.d

Sector and profile
The food and beverages industry is by far the most important part of the manufacturing sector in Croatia. According to Croatian Chamber of Commerce data, it represents 18.8% of the total value of the manufacturing sector, compared to, for example, the tobacco processing sector, which amounts to 2.7% of the total. In 2004, 46,000 people were directly employed in the food, beverages and tobacco sector. Consequently, it is one of the more competitive sectors, since food and, especially, beverages consumption in Croatia is related also to the size of the tourism sector. Hence, some of the largest Croatian companies, including Agrokor, Lura and CCBH sell diverse beverages through various outlets or channels. In recent years, companies have tended to diversify in terms of their involvement in carbonated soft drinks, fruit juices, and bottled water.

Operating in Croatia since 1968, Coca-Cola Beverages, Hrvatska (henceforth CCBH) became part of the Coca-Cola Hellenic Bottling Company (CCHBC) after a merger in 2002. It is now almost entirely owned by CCHBC, Europe's largest soft drinks company, operating in twenty five European countries and Nigeria. CCBH produces, bottles and sells Coca-Cola beverages in Croatia, under license from the Coca-Cola Company. It currently employs around 800 people in six locations in Croatia. Whilst CSD's still accounted for 87% of total sales in 2004, the company also sells juices, ice-teas, water, and sports drinks. The market for soft drinks in Croatia increased between 2000-2005, growing at an average annual rate of 3.9%. CCBH remains the leading company in the market. In 2004, it held on to just over 60% of the market share of CSD sales in Croatia, a steady decline from just over 67% in 2001, but had built up its share of fruit juices (to about 20%) and ice-teas (19.5%) and had entered the water market with a 3.4% share in 2004, on less than a full year of production. Its reported after-tax profits for 2005 were around 53 million HRK (Privredni vesnik, 2006; 54).

Reporting

CCBH published an Environmental Report, not based on the GRI guidelines, in May 2002. In November 2003, it was the first Croatian company to produce a Social Report based on the GRI guidelines, covering performance in 2002, with 2000 and 2001 data also covered. In October 2005, it became the first company in Croatia to produce an integrated Sustainability Report in accordance with the GRI guidelines (CCBH, 2005), covering performance in 2003 and 2004. It is committed to such reports every two years, with the next report due to be published in 2007. All reports were produced in Croatian and in English languages and the current report is available on the company's web site. The Table of Contents of the Sustainability Report, totalling ninety four pages, is shown in Box 1 below.

Box 1 **CCBH Sustainability Report, October 2005**
I.   Statement by the Chief Executive
II.   Verification Statement by the President, the Croatian Chamber of Commerce
III.   Report Summary
A: INTRODUCTION: turning our principles into policies, practice and performance
1.   Who We Are – highlighting change; promoting partnerships
2.   What We Believe – sharing vision and commitments
3.   How We Operate – corporate governance and risk management systems
B: IMPACTS & PERFORMANCE
4. The Workplace
5. The Environment
6. The Marketplace
7. The Community
8. Adding Value: integrating economic, environmental and social dimensions
C: COMMITMENTS
9. Enhancing Sustainability: improving performance & looking to the future
Appendices
I.   GRI Index
II.   Policy Statements

The parent company CCHBC has produced annual Social Responsibility Reports covering the years 2003, 2004 and 2005, all of which can be downloaded from its web site (http://www.coca-colahbc.com/community/download_center.php). The first report includes GRI indicators only for the environment, whereas the 2004 and 2005 reports, the former more

extensively, use the GRI indicators. The latest report, fifty two pages in length, includes sections on the business, governance, a special section on water, and performance reports and goals for the future relating to the marketplace, the workplace, the environment, and the community. The report includes a GRI index but no external verification.

CCBH's Social Report includes an appendix on methodology, in part as an exercise in transparency and, in part, in order to promote reporting by other companies in Croatia. Essentially, the method for compiling the Sustainability Report remained the same, with external consultants (two of the authors of this paper) working closely with the editor of the report (the other author of this paper) and a senior management group. The Sustainability Report introduces the idea of a link between CCBH's reporting and the Institute of Economics consultants, offering an assessment of progress made in terms of goals from one reporting cycle to the next.

Drivers for reporting
Quite a clear progression can be traced in terms of the drivers for reporting over time. The environmental report was a direct attempt at risk management and strengthening of company reputation in the face of external pressures, namely criticisms regarding the environmental impacts of the company's Zagreb production plant. The positive results from this report itself, and dialogue in place of critique, coincided with a thoroughgoing modernisation of country-level corporate culture.

The first social report, using an external consultant (Stubbs) and reporting according to the GRI guidelines, was driven by a mixture of intellectual curiosity and clear leadership by a small group of senior managers, including Tafra-Vlahović, in the absence of any similar reports in Croatia and, indeed at that time, no reporting tradition within the parent company. In retrospect it was a 'brave' step involving considerable exposure, revealing the company's average annual salary and market share for the first time, and a degree of self-criticism (the results of an employee satisfaction survey were included explicitly for this reason). In the words of a senior manager, it involved "opening ourselves up to our stakeholders and saying - well, this is what we are". Turning a 'threat' into an opportunity, the report was a first step in terms of raising awareness within the company, and explicitly recognising the positive social impacts of aspects of the company's performance which had not, up to that point, been recognized, a kind of shift from a lack of recognition of competence to an increased awareness of competence.

A similar process was at work in regard to the parent company, still at the time a largely unfamiliar corporate culture, which allowed CCBH to operate in terms of 'freedom within a framework'. The report was cleared with CCHBC and external validation by the International Business Leader's Forum, of which the Coca-Cola Company is a member, was seen as important in linking the 'pioneering' role of CCBH with best international practice. The report prioritised relationships with employees, the local community, customers and consumers, with less attention paid to dialogue with suppliers, NGOs, business organisations, and even less to central and local government (Gregory and Tafra, 2004; 20). The report also drew out of a wish to report on the national and local activities and commitments of a 'global' brand.

The subsequent Sustainability Report, already a commitment from the previous Social Report, continued to be driven by an internal management desire to be both first and best, within Croatia and within the group. It was also driven by, and reflected back, a change in the

corporate culture towards a more explicit commitment to sustainability, to an elaboration of stakeholder dialogue, and to a more holistic and systematic set of policies and processes in place to support this. By this time, the second, and more coherent CCHBC Social Responsibility Report had been issued which, particularly in the area of environmental reporting, also formed a benchmark. The CCBH Sustainability Report focused less on community activities and much more on governance structures. Its final, expanded, section on future commitments included an assessment of progress and merged the goals of the parent company's report with six key themes for 2005 and 2006.

Impacts of reporting

The reporting has contributed to, and is itself a product of, strengthened and modernized management structures which is also reflected in the pursuit of a wide range of ISO certification for various business processes. It has gained acceptance as part of the normal routines of doing business. Of particular note is the attention to explicit policy statements in the time between the Social Report and the Sustainability Report, including group statements on human rights and sales and marketing in relation to children, as well as a CCBH policy regarding HIV/AIDS. Crucially, the Sustainability Report was able to reflect changes in corporate governance towards a more explicit recognition of the importance of CSR. In 2004, a Council for Social Responsibility had been formed by CCHBC and this led to the founding of a local team for CSR within CCBH consisting of the Deputy General Manager, the Public Affairs and Communications Manager, and the Quality Assurance Manager which, in fact, formed the key Steering Group for the Sustainability Report. The report notes the need to add the Human Relations manager to this group and raises the possibility of including CSR objectives within executive remuneration.

Stakeholder consultation remains a clear commitment although, in terms of the impacts of reporting, it has, perhaps, been emphasised less than the technologies of reporting according to the indicators and principles of the GRI. Reporting has certainly contributed to a clearer awareness of the need to invest in research and actions to assess and improve communication and consultation processes. In terms of relationships with employees, the underlying conditions are difficult and, indeed, there was a strike in CCBH soon after the publication of the report. The background to this was the management's commitment to continued restructuring and a degree of downsizing to concentrate on core business activities. Within this, CCBH has focused on strengthening its human resources, improving training opportunities, and offering choices to those employees faced with redundancy.

Reporting has reinforced a tendency to focus more on longer-term localized partnerships than on corporate philanthropy, in part at least, based on an assessment that CCBH cannot compete with some of the leading Croatian companies in this regard. More emphasis on work with policy makers also appears to have derived from a wider recognition of the company's leading role in sustainability practices. Key managers from CCBH continue to play a leading role in the sustainability field in Croatia. Polices and practices in relation to advertising, to labelling, and to suppliers, have also improved, both nationally and globally.

Assessment

Whilst maintaining a leadership position in terms of CSR and sustainability, there has been a shift from some of the more public aspects of this towards a strengthening of reputation amongst peers and policy-makers. The company has sought to complement, or even re-orient, its image as a global brand to one of a company committed to sustainable development at the national and local level. A changed organizational culture now reflects a commitment to

modern management approaches, combining stated policies and procedures with space for innovation and creativity. Within this, there is a much greater recognition of the value of sustainability competences in and for themselves but also in terms of reframing general management approaches. In some ways, the most interesting and most complex issue is the evolving relationship between CCBH and CCHBC. The group has now not only caught up but, in many ways, taken the lead in terms of sustainability reporting. This suggests that, in the future, the balance between national and trans-national commitments and processes will be a more explicit subject of formal negotiations around the concept of 'autonomy within a framework'.

3.2 Zagrebačka banka d.d.

Sector and profile
The market structure of the banking sector has undergone significant changes in many countries in transition over the past ten years, and Croatia has been no exception. The change of bank ownership structure from state ownership to foreign-bank ownership is particularly important in Croatia. Between 1996 and 2003, following a series of bank crises, the share of assets held by foreign banks increased dramatically. By 2003 more than 90% of the banking sector's total assets were foreign-owned. Thus, the Croatian banking system is characterized by a high degree of foreign ownership (Slijepčević and Živković, 2005).

Liberalization of the banking system began in 1993 in Croatia with the adoption of the Act on Banks and Savings banks. Of numerous banks in Croatia, Zagrebačka banka (ZaBa) is one of the oldest financial institutions in Croatia (existing since 1914). After privatisation of the Bank, it was purchased by the Italian-based UniCredit Group in 2002,which owns almost 82% of all shares. On the basis of the financial strength of the foreign owner - UniCredit Group has more than €89bn in assets - ZaBa is currently the leading bank in Croatia, with more than 4400 employees, 1.2 million clients and 903 million HRK profit in 2005, holding a quarter of the total market share in credit financing and almost one third in deposits.

Reporting
ZaBa produced its first Social Report in November 2005, covering performance in 2003 and 2004 with some statistics from 2002 also included. It was prepared in accordance with the GRI guidelines and indicators, including eight additional indicators drawn from the GRI Financial Services supplement, although it contains no independent verification statement. Produced in both English (eighty four pages) and Croatian (eighty pages) language versions, the contents of the report are shown in Box 2 below. The report can be directly linked to and downloaded from the Bank's home page (ZaBa, 2005), with more detailed online reporting on sustainability planned as part of a new website currently under construction.

ZaBa's parent company UniCredit Group has produced annual Social and Environmental Reports covering performance each year from 2000 up to and including the latest 2005 report which presents the company's new profile as a 'truly European Bank', following mergers with the German HVB and Austrian Ba-Ca banks (UniCredit Group, 2006). The one hundred and fifty two page 2005 report, which includes a verification by the auditors KPMG, appears to be loosely based on the GRI guidelines although the indicators listed are not cross-referenced as required in order to be 'in accordance' with the GRI standard. The web site states explicitly that the report "is a document of value not only in communication terms, but also a form of management tool, telling us what, how and how much has been achieved and for whom. In recent years efforts have been concentrated on clarifying the coherence between

business and management strategies and our relations with stakeholders" (http://www.unicreditgroup.eu/DOC/jsp/navigation/include_content.jsp?parCurrentId=0b003 0398031b035&parCurrentPage=bilancio_soc_ambient.html&locale=en).

5. (Separate) Questionnaire

ZaBa contracted consultants from the Institute of Economics including one of the authors of this paper, who were responsible for supporting the process, clarifying and translating the GRI guidelines, running a series of workshops with managers designated to collect and interpret information, helping plan the report structure, and commenting on drafts. The report was written by a core team from the Bank's Department for Corporate Communications and Marketing.

Drivers for reporting
As a founder member of HRPSOR, joining in 1997 and, in particular, as a company which had profiled itself in terms of an explicit sustainable development policy and practice, the commitment to produce a social report was a natural progression. In particular, the Bank had been the first Croatian company to introduce a public tender competition for donations for projects which improve the life of the community, in 1999. The annual competition was refined in 2003 and now includes four categories: Children and Young people; Humanitarian activity; the Arts; and Cultural Heritage, with a separate fund for environmental projects. Another driver was the Bank's position as the leading bank in Croatia, a large employer, and recipient of a number of awards. The initial work on CSR was steered by one person but this spread to others within the Department for Corporate Communications.

In broad terms, the key internal driver was a desire to demonstrate to employees that ZaBa's leading market position was matched by leadership in corporate social responsibility. In the

five or so years of intense activity in CSR, there had been a feeling that this was not sufficiently known about, understood or even, to an extent, supported, by most of the staff. In a way, the issuing of the report sought to raise awareness of what had been done and act as a catalyst to spread the values of CSR more widely within the company. At the same time, this was matched by an external driver in terms of a wish to communicate more effectively and systematically with external stakeholders, primarily customers and potential customers, but also with policy makers and potential investors, regarding the Bank's general profile and products and, in particular, its commitments. This can be seen in the descriptions in the report of socially relevant investments and lending with a high social benefits (pp. 27 – 33); on customer privacy (p 35); and, most clearly, regarding corporate giving (pp. 53 – 63). In many ways, the report was a charter of achievements over a five or six year period, with the explicit intention of being a catalyst for the further and deeper development of sustainability competences throughout the company.

Interestingly, there was no pressure for reporting, either explicitly or implicitly, from UniCredit Group, which asked ZaBa to contribute data and information for its annual Environmental and Social Report but which allowed the company complete freedom in terms of whether or not, and in what form, to report on ZaBa's own sustainability practices. Beyond reference to the parent company's reports, and a note on activities under the umbrella of the Unidea UniCredit Foundation (p 63), there is no uniformity between the ZaBa Social Report and UniCredit's reporting.

Impacts of reporting
The methodology used for producing the report was designed explicitly to achieve the goal of raising awareness within the company both in terms of sharing information but also in terms of sending a message that social and sustainability reporting was about more than figures, facts and a few human interest stories. The consultant-led workshops, attended by some twenty key staff, served as awareness raising sessions in this regard. The process helped in a redefinition of CSR within the company from being concerned primarily with a charitable or philanthropic conception, based almost entirely on donations, to an awareness of the importance of impacts on customers, employees, and, to an extent, on the environment. The report was one part of a consistent effort by a small dedicated team, which also included organizing a high profile seminar on Social Responsibility involving senior management from ZaBa and a representative of the UniCredit Foundation, focused, in particular, on discussing the reporting of CSR in the media.

A crucial change can also, in part at least, be traced to reporting, namely a decision to introduce a social responsibility dimension into key bank products, notably in terms of a grace period for loan repayments coinciding with parental leave. In addition, as an example of cause-related marketing, new home loans include a ZaBa donation towards a house for young people leaving institutional care. Something of the seed for both ideas was laid by increased awareness of such practices in reporting through familiarity with the Financial Services supplement of the GRI.

In addition, induction training for new employees now includes, for the first time, a section on the Bank's commitment to CSR. ZaBa is also one of the leaders in Croatia in terms of employee volunteer schemes. Whilst the annual grants programme continues to act as a flagship in terms of the Bank's corporate philanthropy, more long-term partnerships are also being developed with particular NGOs and institutions, including UNICEF, a Guide Dogs for the Blind NGO, and a manufacturer of ecological foods. Indeed, one of the features of the

Social Report is the inclusion of testimonials by key partners although, in part because of time constraints, an initial idea of having a team of external verifiers drawn from different sectors was abandoned.

Crucially, the corporate governance structures have been changed to reflect a more holistic commitment to sustainability, with a newly formed Corporate Responsibility team directly responsible to the Bank's CEO. The medium-term goals of this team reflect an ambitious programme of integrating dimensions of CSR which have, perhaps, not been so well developed, to finding synergies between the different activities, as well as consolidating policies, practices and procedures. The Bank will issue its first Sustainability Report, again working with a team from the Institute of Economics, according to the GRI guidelines, in 2007.

Assessment

The first Social Report by Croatia's leading bank, actually confirmed its leadership role in aspects of corporate social responsibility in Croatia, being a description and stock-taking of achievements thus far, and a catalyst for a widening and deepening of its sustainability practices in the future. A series of events meant that the report was also used as a catalyst for improved communication with external stakeholders and a deepening of commitments to longer-term partnerships. The process of compiling and writing the report, whilst it served to raise awareness within the various Departments of the company, was a lengthy and time consuming process and, perhaps, had detrimental consequences in terms of the abandonment of plans for an innovative form of external verification. In addition, although perhaps in keeping with a first report, the concluding section in terms of commitments for the future is short and somewhat general. Perhaps the most striking contrast with the other case study is the apparent lack of any impact in terms of the Bank's relationship with its parent company. It will be interesting to see in the future whether this changes and, indeed, whether ZaBa's leadership in CSR and in reporting has impacts on other banks in Croatia and/or on the banking sector, including UniCredit subsidiaries, elsewhere in Central and Eastern Europe.

4. CONCLUSIONS

There are many similarities between the two case study companies, in particular, in terms of the motives for, and impact of reporting. Both are long-standing Croatian companies and, now, part of a larger, multi-national, parent company. Both are clear market leaders in their particular, highly competitive, sectors. Both have long-standing commitments to CSR practices, led by key champions but increasingly spread throughout the organization. Both sought, explicitly, to use reporting as a way of raising awareness of their CSR commitments within the company and for external stakeholders. Both have changed their corporate governance structures to prioritise sustainability. Both are now committed to a cycle of bi-annual Sustainability reporting based on the GRI standard. In terms of Dunphy *et al*'s stages, both can be seen to be close to entering a third wave of a transformative commitment to sustainability.

There are also a significant number of differences. ZaBa relies on its national reputation whereas CCBH seeks to solidify a national reputation in the context of a global brand. CCBH began reporting earlier and has, in consequence, reached a more advanced form of reporting and, in particular, has in place an embryonic benchmarking and monitoring system for

chasing sustainability goals. ZaBa has profiled its corporate philanthropy leadership more as its 'flagship' for CSR, whereas CCHBC, perhaps, sees reporting and peer reputation as more important. Table 2 summarises the main points of similarity and difference between the two companies in terms of reporting.

TABLE 2: Case Studies Compared

ISSUE	CCHBC	ZABA
Leadership	Domestic market leader, group is international market leader	Domestic market leader, part of international group
Reporting Status	Advanced – Sustainability; GRI, Benchmarking Performance; External Verification	Beginning – GRI on social reporting; Limited Benchmarking; No External Verification
Governance Structures	Transitional – Policy commitments in place	Beginning – Policy commitments undeveloped
Themes Emphasised	Holistic – Stakeholder Oriented	Community Development – Customer and Civil Society Oriented
Reputation	Moving from Negative to Positive – Domestic and International	Positive – Focus on Philanthropy
Parent Company	In advance of PC though catch up occurring	Behind PC – No Plans for Convergence
Future	Innovation Through Delivering Value	Innovation through Move to Sustainability Reporting

In terms of some of the hypotheses regarding reporting noted earlier, the case studies appear to show the importance of leadership in the context of the Croatian CSR field but also the relevance of the transition context. In a 'field' marked by no more than a dozen regular reporters and a mere handful of GRI 'in accordance' reporters, there has not yet been any evidence of the diminished impact of reporting. Crucially, whilst CCBH's initial environmental report was, in part, driven by external pressure and a desire to manage reputation, the subsequent Social Report was more a stock-taking venture, and the Sustainability report was driven fully by strategy, values and a kind of assertiveness that transparency, honesty, and dialogue work in the interests of all. ZaBa, which did not face external pressure, is now developing a more holistic strategic sustainability framework under a longer-term timescale. Both companies have changed their structures and developed new narratives in the process of reporting. The most underdeveloped issue for both companies is that of stakeholder dialogue and, in particular, the design of diverse channels for diverse stakeholders.

The evidence presented here suggests that there is a clear link between the development of a range of developmental imperatives within companies, sustainability competences and reporting practices. The in-depth case studies presented here need to be complemented by wider surveys of managerial attitudes and practices among a range of reporters. The reasons why many leading companies, including leaders in sustainability practices, still do not report regularly and systematically in Croatia, also deserves special attention. In the context of interest in the economic value of 'clusters' in Croatia (cf. Redžepagić and Stubbs, 2006), it will be interesting to see whether 'sustainable business clusters' in which companies work together, and with other stakeholders, to deliver long-term social and environmental benefits (cf. Zadek, 2004 ch. 29; Regional Futures, 2004) will also be developed in Croatia. In the future, research on the nature of competences in different fields will need to explore the link

between emerging sustainability clusters and networks and wider responsible competitiveness. This paper has, we hope, opened a door to promote more diverse methods and analysis of the symbiotic relationship between reporting, sustainability and management practices in Croatia.

Further research is needed to build on the findings of these case studies and generate hypotheses which can be tested and lead to generalisable statements regarding the role of reporting in Croatia. The following appear to us to offer the most important lines of inquiry:

- What factors encourage Sustainability Reporting in Croatia? Why have some leaders in CSR practices not yet entered into systematic reporting?
- Are managerial attitudes, practices and competences in terms of sustainability reporting a good predictor of other aspects of the management function?
- Are leading reporters more networked within the sustainability field than other companies?
- What are the motivations for reporting in a range of reporters? How does this vary with sector; size; leadership; and corporate governance?
- Is there evidence of lesson learning and transfer of sustainability competences from elsewhere or are they more often 'home grown'?
- How does sustainability reporting relate to companies' definitions of key stakeholders? How do companies seek to measure stakeholder impact?

Abstract

The paper empirically examines the influence of transformational leadership on the process of learning in organizations. Organizational learning is one of the most important sources of a sustainable competitive advantage, as well as an important driver of corporate performance. Leadership appears to be one of the most powerful facilitators of the organizational learning. However, there is little prior empirical evidence for the impact of leadership on organizational learning. Data were collected at the organizational unit level from 753 employees in Slovenia, using combination of the Multi-factor Leadership Questionnaire (MLQ) and the Organizational Learning and Information Management Processes (OLIMP) measurement instrument. The results indicate that transformational leadership has a strong impact on all four phases of organizational learning: Information Acquisition; Information Distribution; Information Interpretation; and Behavioral and Cognitive Changes; however, it only directly impacts the first and last phases. Total effect sizes range from .61 to .79.

1   INTRODUCTION

Organizational learning is one of the most important sources of a sustainable competitive advantage that companies have (de Geus 1988) as well as an important driver of corporate performance (Stata 1989). Given the turbulent environments that organizations work within, continuous learning is a key driver of their ability to remain adaptive and flexible – that is to survive and effectively compete (Burke, Stagl et al. 2006). Studies have shown that it affects competitive advantage (Jashapara 2003), financial and non-financial performance (Bontis, Crossan et al. 2002; Dimovski and Skerlavaj 2005; Jimenez-Jimenez and Cegarra-Navarro 2006), tangible and intangible collaborative benefits in strategic alliances (Simonin 1997), the unit cost of production (Darr, Argote et al. 1995), and innovation (Llorens Montes, Ruiz Moreno et al. 2005). It is especially important for companies from transitional economies, which strive to catch-up the world's leading competitors.

Given the significance of organizational learning for corporate performance, it is important to understand how managers can influence the learning process in organizations. Authors suggest several antecedents to organizational learning such as the organizational structure, organizational culture, and subordinates' autonomy (Bapuji and Crossan 2004), human resource management practices (Wright 2001), teamwork cohesion (Swieringa and Wierdsma 1992; Marquardt 1996; Dyerson and Mueller 1999; Llorens Montes, Ruiz Moreno et al. 2005), social capital (Nahapiet 1998) and information-communication technologies (Tippins 2003; Ruiz-Mercader, Merono-Cerdan et al. 2006). In addition, several authors have emphasized the importance of leadership for organizational learning (Swieringa and Wierdsma 1992; Lei, Slocum et al. 1999; Llorens Montes, Ruiz Moreno et al. 2005; Perez-Lopez, Montes-Peon et al. 2005). The capability for transformational leadership has even been described as one of the most important means of developing learning organizations (Slater and Narver 1995; Maani and Benton 1999; Snell 2001), especially since leadership also influences many of the previously listed antecedents to organizational learning.

However, the relationship between leadership and organizational learning has rarely been empirically examined. The purpose of the study is to empirically investigate the relationship between leadership and organizational learning in the context of a small transitional economy. More specifically, the study examines the influence of transformational leadership on learning in organizational units drawn from a wide range of organizations. The basic research questions is whether transformational leadership contributes to learning in organizations.

The paper is structured in four major sections. In the first section we provide some theoretical background to the concepts used in the study – organizational learning and the transformational leadership theory. We conclude the first section by reviewing existing research on the relationship between leadership and learning in organizations, develop a theoretical model and propose hypothesis to be tested. The second section deals with the methodology. We discuss the research instrument, research design and data collection, characteristics of the sample and statistical methods used. In the third section we present the results. Finally, in the last section we discuss the theoretical and practical implications of the study, review its contributions and limitations and propose some questions requiring further investigation.

2 THEORETICAL BACKGROUND

2.1. Organizational learning

Organizational learning remains a very popular concept in the modern managerial literature and has been defined in many different ways. Early authors understood it simply as a process of detecting and correcting errors (Argyris and Schon 1978). Fiol & Lyles (1985) perceived it as a process of improving actions through better knowledge and understanding. Huber (1991) defined organizational learning as the processing of information with the aim to store knowledge in the organizational memory. He claimed that an entity learns if, through the processing of information, the range of its potential behaviors is changed. According to Huber (1991), organizational learning consists of four phases: (1) information acquisition; (2) information distribution; (3) information interpretation; and (4) organizational memory. Dimovski (1994) extended Hubers' information-processing perspective to include action and defined organizational learning as a process of information acquisition, information interpretation together with the resulting behavioral and cognitive changes which should, in turn, have an impact on organizational performance. Other authors emphasizing the importance of action and changes for organizational learning are Kim (1993), Crossan (1995), and Sanchez (2005).

Building on these arguments, we define organizational learning as process consisting of four consecutive phases: (1) information acquisition; (2) the distribution of information; (3) information interpretation; and (4) the resulting behavioral and cognitive changes. The first three phases may be grouped in the information-processing stage. While we might expect these consecutive phases to be empirically highly related, they are theoretically distinct and related as such.

The information-processing (and organizational-learning) cycle starts with the collection of information from both *internal* and *external* sources, while the third key sub-dimension of information acquisition is *employee training*. When assigned adequate importance, these three sub-dimensions allow employees to constantly update their work-related information base.

The information gathered through various sources and ways needs to be distributed to those members of an organization that might require it (Huber 1991). Several channels and conduits exist that allow for information distribution. Some conduits rely more on *'people'* (employees are acquainted with goals, take part in more cross-functional teams etc), while others rely on *'systems'* (e.g. information system, organized meetings to inform employees, formalized mechanisms and systems to facilitate the transfer of best practices).

Information must be given meaning. 'Interpretation is the process of translating events, of developing models for understanding, of bringing out meaning, of assembling conceptual schemes' (Weick and Daft 1984). The purpose of interpreting information is to reduce the ambiguity related to information. Recent research in the area of organizational learning culture and organizational performance (Skerlavaj, Indihar Stemberger et al. in press) has demonstrated that information interpretation also differs in the way people get together in order to understand the information acquired and distributed. Some vehicles might be *formal* such as official memorandums, expert reports, seminars and similar events. Other meetings might be more *informal* and involve team and personal meetings.

Organizational learning is reflected in 'accompanying changes' (Garvin 1993). Spector and Davidsen (2006) claimed that 'learning is fundamentally about change'. If no *behavioral or*

284

cognitive changes occur, organizational learning has not in fact occurred and the only thing that remains is unused potential for improvements (Fiol and Lyles 1985; Garvin 1993). Sanchez (2005) supported this notion by saying that 'knowledge has a value to organizations only when it is applied in action within an organization's processes' (p. 12) and that 'organizational learning can be said to occur when there is a change in the content, conditionality, or degree of belief of the beliefs shared by individuals who jointly act on those beliefs within an organization' (p.16).

Two levels of learning can be observed when discussing cognitive changes. Lower-level learning reflects changes within the organizational structure which are short-term and only partly influence the organization. Higher-level learning reflects changes in general rules and norms (Fiol and Lyles 1985). Argyris and Schön (1996) classified learning similarly: single-loop and double-loop learning, (Dodgson 1993) discussed tactical and strategic learning, while Senge (1990) used the terms adaptive and generative learning. By all means, with lower-level learning the organization acts passively and only adapts to the environment, whereas higher-level learning involves an active influence on the business environment.

2.2 Transformational leadership

Like organizational learning, leadership is a complex phenomenon that has been understood and defined in many different ways. In this study we focus on transformational leadership as conceptualized by Bass (1985) and developed by Avolio and Bass (1991) in their 'full-range leadership theory'. They distinguished between three major types of leadership behavior: laissez-faire (non-leadership), transactional and transformational leadership. The transactional leadership process is based on exchange: the leader offers rewards (or threatens punishments) for the performance of desired behaviors and completion of certain tasks. This type of leadership may result in the followers' compliance but it is unlikely to generate enthusiasm for and a commitment to task objectives. Transformational leadership lies in the leader's ability to inspire trust, loyalty and admiration in followers who then subordinate their individual interests to the interests of the group. Rather than analyzing and controlling specific transactions with the followers by using rules, directions and incentives, transformational leadership focuses on intangible qualities such as vision, shared values and ideas in order to build relationships, give larger meaning to separate activities and provide common grounds to enlist followers in the change process.

Transformational leadership encompasses five dimensions. *Idealized influence (attributed)* refers to the socialized charisma of the leader, whether the leader is perceived as being confident and powerful, and whether the leader is viewed as focusing on higher-order ideals and ethics. *Idealized influence (behavior)* refers to the charismatic actions of the leader that are centered on values, beliefs and a sense of mission. *Inspirational motivation* refers to the ways the leader energizes their followers by viewing the future with optimism, stressing ambitious goals, projecting an idealized vision and providing encouragement and meaning for what needs to be done. *Intellectual stimulation* occurs when the leader stimulates new perspectives and ways of doing things, questions old assumptions and beliefs while encouraging the expression of ideas and reasons. *Individualized consideration* refers to leader behavior that contributes to the satisfaction of followers by treating others as individuals, considering their individual needs, abilities and aspirations and thus allowing them to develop and self-actualize (Antonakis, Avolio et al. 2003).

Transactional leadership may be an effective type of leadership. Previous research has indicated a positive correlation between contingent reward leadership and effectiveness, and

no relationship between management by exception and effectiveness (Lowe, Kroeck et al. 1996). However, transformational leadership is even more effective. Bass (1985) argued that transformational leadership builds on or augments transactional leadership. Several meta-analyses of the Multifactor Leadership Questionnaire ('MLQ') studies have identified transformational leadership as the most effective type of leadership behavior (Lowe, Kroeck et al. 1996; DeGroot, Kiker et al. 2000; Dumdum, Lowe et al. 2002).

2.3 Transformational leadership and organizational learning

By the nature of their status, leaders serve as information centers of their units or teams. They therefore have a strong influence over the way information is acquired and distributed in the unit. Laissez-faire leaders, for example, will inhibit the flow of information due to their inactivity. The processes of acquiring and distributing information will therefore operate below optimum. The communication between unit members will be restrained and slowed down. New knowledge will be difficult to obtain, while information from different sources will not be widely shared. On the other hand, transformational leaders encourage open, honest and timely communication, and foster dialogue and collaboration between team members. They encourage the expression of different views and ideas. They act as catalysts, speeding up the knowledge acquisition and distribution. In the same manner, by allowing the expression of different views and ideas, by challenging old assumptions and beliefs and by stimulating new perspectives, they enhance the process of information interpretation as well. Finally, transformational leaders may facilitate the cognitive and behavioral changes in organizational members resulting from previous phases of organizational learning. Hence, an organization that wishes to learn better should adopt more transformational styles of leadership. Its leader would be a catalyst, a mentor, a facilitator and a trainer of learning capability.

The empirical evidence, although scarce, generally supports these assertions. A meta-analysis examining the relationship between leadership behavior in teams and team performance outcomes found that, out of 50 empirical studies, only three included organizational learning as the outcome variable and none of them examined the relationship between transformational leadership and organizational learning. They did, however, examine the influence of empowering leadership, which may be related to transformational leadership. The use of empowerment behaviors explained 31% of the variance in team learning, with the effect size equaling .56 (Burke, Stagl et al. 2006).

In a study of leadership and organizational learning's role on innovation and performance Aragon-Correa, Garcia-Morales, & Cordon-Pozo (in press) found that transformational leadership facilitated the organizational members' ability to create and use knowledge. Using data from 408 large firms from Spain and structural equation modeling, they found a strong and statistically significant effect of transformational leadership on organizational learning, with the standardized structural coefficient equaling .81. Similarly, a study of 202 companies from Spain examined the influence of support leadership on learning in organizations (Llorens Montes, Ruiz Moreno et al. 2005) as part of a larger structural equation model focusing on the determinants of organizational performance. Support leadership was conceptualized as being similar to transformational leadership but with a greater emphasis on tolerance, support and freedom to develop open communication. The direct effect of support leadership on organizational learning equaled .54, while the total effect was even larger (.64).

Recent research among 104 Jewish elementary schools (104 principals and 1,474 teachers) showed that transformational leadership had a significant positive direct effect on

organizational learning (β = .21) (Kurland & Hertz-Lazarowitz, 2006). The effect of transactional leadership was still positive but somewhat weaker (β = .15), while the effect of the laissez-faire leadership style showed a negative impact on organizational learning (β = -.15). These arguments lead to the following hypothesis:

Hypothesis 1: *Transformational leadership positively influences the information acquisition (H1a), information distribution (H1b), information interpretation (H1c), and cognitive and behavioral changes (H1d) dimensions of organizational learning.*

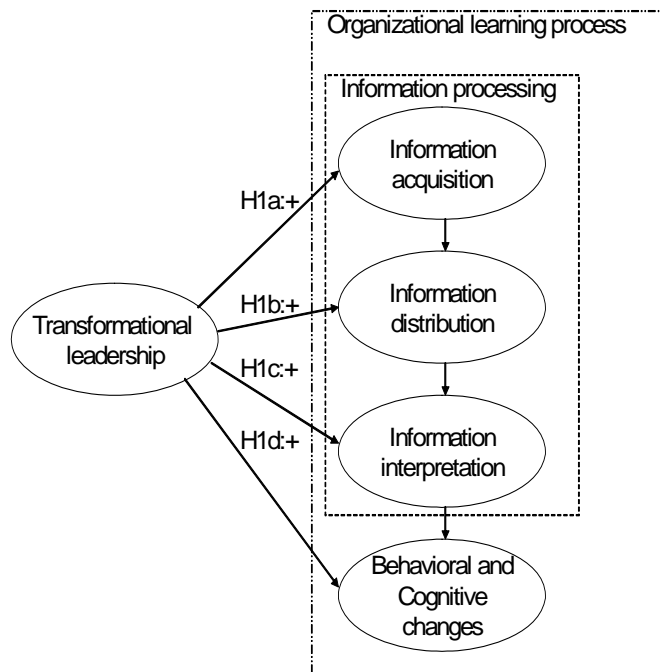
The relationships between the transformational leadership and organizational learning is summarized in the conceptual model presented in Figure 1.


Figure 1. *Hypothesized impacts of laissez-faire, transactional and transformational leadership on organizational learning.*

3 METHOD

3.1 Research instrument

In order to ensure content validity and ensure the widest possible comparability of results we built our measure on the previous research base and used pre-tested constructs and measures to the greatest extent possible.

When choosing a valid and reliable measurement instrument to assess the organizational learning process, we found that three operationalizations prevail. One is the Strategic Assessment Map (Bontis, Crossan et al. 2002), the second follows Nonaka and Takeuchi's (1995) SECI model, while the third follows the tradition of Hubers' (1991) definition of organizational learning. In upgrading Hubers' (1991) information-processing

perspective with the behavioral and cognitive dimension and an extensive literature overview, Dimovski (1994) developed a set of items wrapped up in the OLIMP questionnaire (see the Appendix), which has since then been refined and tested on several occasions (in the USA, Slovenia, Croatia, Malaysia) at various points in time (1994, 2002, 2003, 2004, 2005, 2006). Given the complexity of the organizational learning measurement it always yielded adequate psychometric properties. In this version, we upgraded the questionnaire with six additional items in order to also measure the information-distribution dimension. Five-point Likert scales were used. The questionnaire consisted of four dimensions and nine sub-dimensions, totaling 36 items. The sub-dimensions and items are listed in the Appendix.

The transformational leadership (as well as it's sub-dimensions) was measured using the Multifactor Leadership Questionnaire (MLQ), form 5X (Bass and Avolio 1990). MLQ is one of the most widely used and tested measures of transformational leadership exhibiting sound psychometric properties (Avolio, Bass et al. 1995; Lowe, Kroeck et al. 1996; Antonakis, Avolio et al. 2003). It contains 36 items representing the nine factors (laissez-faire leadership, management by exception (active), management by exception (passive), contingent reward, intellectual stimulation, inspirational motivation, individualized consideration, idealized influence). Each scale is thus made up of four items. In addition, nine items assess the three leadership outcome scales (these scales were not the focus of the study).

The MLQ was translated into the Slovenian language using the translation-back-translation technique. In addition, prior to this study the MLQ had been administered to 130 respondents, obtaining good levels of reliability. Nevertheless, as a result of the pre-testing some minor modifications to the wording were made for the most problematic items.

3.2 Research design and data collection

For the purposes of the research, we chose the organizational unit as the focus of the study. An organizational unit was defined as a geographically or functionally distinct part of an organization, which has its own leader. The respondents were asked to assess the four constructs of organizational learning in their unit. Similarly, they were asked to rate their leaders (leaders of their organizational unit) regarding the various leadership behaviors specified in the previous section.

Where random sampling is problematic (as in management research), one way to enhance the generalisability of findings is to deliberately sample for heterogeneity (Mark and Cook 1984) . By intentionally selecting subjects who come from diverse organizational settings, the researcher can determine whether a selected model accurately describes the actions of individuals across these divergent contexts. On the other hand, choosing a sample of firms located in a relatively homogenous geographic, cultural, legal and political space reduces the impact of confounding variables (variables that cannot be controlled in the empirical research) (Triandis 1994).

In line with these observations the data were collected in Slovenia in 2006. With its small transition economy and a population of approximately two million, Slovenia is a model of economic success and stability for its neighbors in Central and South-east Europe. The country joined the EU in 2004, has excellent infrastructure, a well-educated workforce and an excellent central location. It enjoys a GDP per capita that is substantially higher than any of the other transition economies of Central Europe (2006). In 2007 it also adopted the common European currency of the euro as the first of the new EU members.

288

Paper surveys were mailed to 1,914 alumni of the undergraduate programs of the Faculty of Economics in Ljubljana, the premier business school in the country. In addition, e-mails with links to the electronic version of the survey were sent to current and former students (up to eight previous generations) from the same school which accounted for an additional 4,485 units (with the possibility of the samples overlapping). 39 paper items were returned due to a non-existing address and about 10% of the e-mails were inactive (approximately 449). Within the first three weeks of the mailing, 418 paper surveys had been completed and sent back, with a response rate of 22.3%. In addition, 374 usable electronic questionnaires were completed (a response rate of 9.3%). Preliminary screening indicated a large number of missing values in 39 questionnaires. These questionnaires were removed from further analysis, making the final sample size 753.

Using this research design we were able to obtain data for organizational units of different sizes, from different functional backgrounds, and from different levels within the organizations. In addition, the units belonged to a wide range of companies in terms of size and industry. In this way the influence of confounding and background variables was randomized and cancelled out, increasing the validity of the empirical findings (Van de Vijver 2003).

3.3 Characteristics of the sample

The average age of the respondents was 34 years; 40% of them were female. Most (48%) have spent between 1 and 5 years in their present position, while 38% of them have worked in the same organizational unit for more than 5 years.

The majority of the leaders rated by the respondents were male (67%). Most of them were between 30 and 50 years old (70%) and only 4% were younger than 30. 63% have spent more than 3 years as the leaders of their present organizational units, while only 11% have been in the present leadership position for less than one year. More than half of the leaders rated belonged to top management (52%), while the rest belonged to middle management (37%) and line management (11%). On average, they had control over 73 subordinates (the number of people at the lower levels of the organization); however this parameter is distorted due to the presence of the CEOs of some large companies. The median number of subordinates was 17. Most leaders came from a business educational background (53%), followed by engineering (27%), the social sciences (10%) and natural sciences (9%).

The respondents and the leaders they rated came from a wide range of organizations within various industries. The size of the organizations ranged from 1 to 17,000 employees, with a mean of 686 and a median of 120 employees. Most of the organizations belonged to service sectors (46%), followed by the non-profit and public sector (22%) and industry (22%).

In general, the data indicate that most of the leaders belong to senior management and have held their leadership positions long enough to make an impact on their organizational or organizational units. Likewise, the majority of the respondents are mature enough and have been in their units long enough to provide a valid assessment of the constructs under study.

3.4 Statistical methods used and model specification

Structural equation modeling was used to test the hypotheses. The relationships between the constructs were estimated using LISREL 8.7 with the correlation matrix and asymptotic covariance matrix as inputs. We also conducted tests of normality which yielded a need to report Satorra-Bentler (SCALED) Chi square fit indices (Sattora and Bentler 1988). In large

samples such as ours the χ^2 test becomes highly problematic because in large samples even trivial differences between theoretical and empirical covariance matrices may result in a large value of the statistic (Joreskog 1993). Therefore, we shall provide several measures of model fit but will use the Comparative Fit Index (CFI), which appears to be the most accurate in a wide variety of situations (Hu and Bentler 1995), as the primary criterion of model fit.

Three model was corresponding to the conceptual model presented in Figure 2. Transformational leadership is measured with five indicators: idealized influence (attributed and behavioral); individual consideration; inspirational motivation; and intellectual stimulation. Transactional leadership is measured with three scales: contingent reward, active and passive

Indicators (sub-dimensions) for the organizational learning constructs were obtained through a combination of exploratory and confirmatory factor analysis, while we upgraded the validated and reliable questionnaire extended with one additional dimension and six items based on extensive theoretical support. Information acquisition is measured with three indicators – internal information acquisition, external information acquisition, and training. Information distribution is measured by two indicators: a people-oriented information distribution, and system-oriented information distribution. Information interpretation is measured by formal information interpretation and informal information interpretation. Finally, behavioral and cognitive changes are measured by two indicators: behavioral changes and cognitive changes. The four dimensions of organizational learning are, in effect, consecutive steps in the process. While we might expect a strong impact on one another, they are theoretically and empirically distinct constructs.

4 RESULTS

4.1 Validity and reliability

Confirmatory factor analysis (CFA) was used to assess the reliability and validity of the constructs used in the study. The construct validity measures how well the indicators represent the corresponding latent variables. Table 1 presents unstandardized and completely standardized factor loadings together with the corresponding t-values for each indicator and construct in the measurement model.

Table 1: Factor Loadings and Construct Validity for the Constructs Used in the Study

Latent variable	Indicator	Unstandardized factor loading	Completely standardized factor loading	t-values
Transformational leadership (Tf)	Idealized influence (attributed) II(a)	.78	.84	31.97
	Idealized influence (behavioral) II(b)	.60	.74	23.02
	Inspirational motivation IM	.85	.83	30.12
	Intellectual stimulation IS	.75	.83	28.86
	Individual consideration IC	.95	.88	36.41
Information acquisition (Infoacq)	Internal information acquisition (INTERNAL)	.54	.69	19.69
	External information acquisition (EXTERNAL)	.45	.57	15.58
	Training as information acquisition (TRAINING)	.74	.67	20.38
Information distribution (Distinfo)	Information distribution via systems (SYSTEM)	.81	.84	29.00
	Information distribution via organizational members (PEOPLE)	.78	.80	27.33
Information interpretation (Infoint)	Informal means of information interpretation (INFORMAL)	.62	.76	20.09
	Formal means of information interpretation (FORMAL)	.63	.72	21.28
Behavioral and cognitive changes (Bcc)	Behavioral changes (BC)	.51	.76	21.03
	Cognitive changes (CC)	.77	.88	31.17

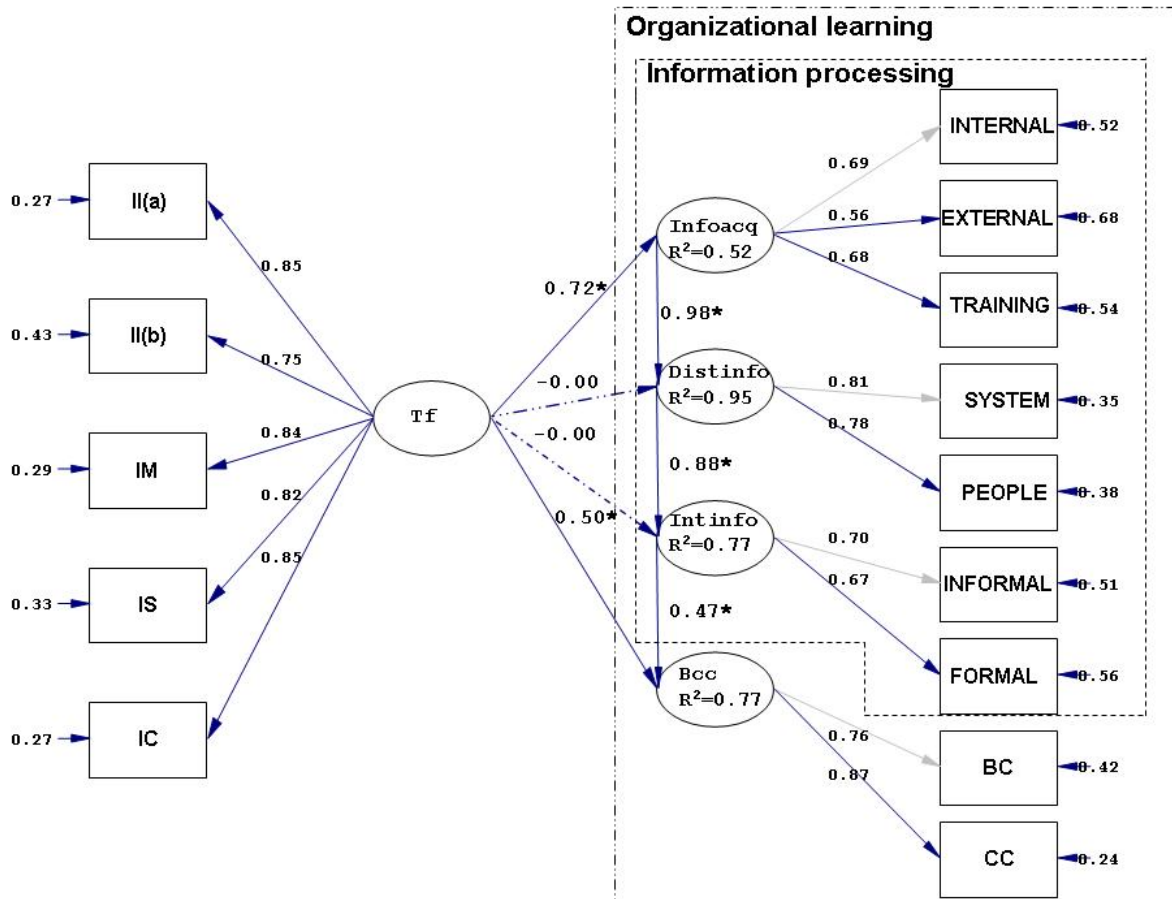
The results show that the factor loadings for all indicators are statistically significant and exceed the threshold of .50 for convergent validity (Hair, Anderson et al. 1998).The values of the Cronbach α, composite reliability index (CRI), as well as the average variance extracted (AVE) for all latent variables in the final measurement model are presented in Table 2. Diamantopoulos and Siguaw (2000) suggested that the threshold for CRI should be set at .60. Constructs exceeding that value are considered to have good composite reliability, which is the case with all latent variables. The cut-off value for AVE is .50 (Hair et al., 1998), where reliable constructs should exceed this value, with Cronbach alphas researchers usually use a cut-off value of α = .70 for studies in advanced phases (α1), while for exploratory studies

alphas ranging from .50 to .60 (α2) are considered to be adequate (Nunnaly 1978; Van de Ven 1979). All of the constructs attain the recommended cut-off values using all three measures of construct reliability. The only exception is the construct information acquisition, which slightly fails the AVE internal consistency test but fulfills the Cronbach alpha for exploratory studies (α2) and, what is more, satisfies the CRI criteria which is considered to be the most robust of all three reliability criteria (Diamantopoulos and Siguaw 2000).

Table 2: Internal Consistency and Reliability

Construct	Cronbach α	CRI	AVE
Transformational leadership	.91	.95	.68
Information acquisition	.67	.78	.42
Information distribution	.81	.88	.67
Information interpretation	.71	.81	.55
Behavioral and cognitive changes	.78	.88	.68

4.2 The relationship between leadership and organizational learning

Figure 3 presents a structural model of the relationship between transformational leadership and organizational learning along with the standardized values of path coefficients. Statistically significant structural coefficients are marked with an asterisk. Overall coefficients of determination (R^2) are also presented for each of the endogenous constructs. The model exhibits a good fit to the data ($\chi^2 = 351.46$, df = 70, NNFI = .98, CFI = .98, and GFI = .93). In addition, the high values of the determination coefficients indicate that the model explains a large percentage of the variance in the endogenous latent variables.


* Statistically significant at p<0.001.

Figure 2. The impact of transformational leadership on organizational learning.

Hypothesis 1 predicted that transformational leadership will have a strong and positive influence on all four constructs of organizational learning. The results show that only two of these four relationships (H1a and H1d) are statistically significant at p<.001. Transformational leadership demonstrated a strong direct impact on information acquisition (γ = .72) as well as on behavioral and cognitive changes (γ = .50). The impact of transformational leadership on information distribution and information interpretation was not found to be direct but indirect. Transformational leadership demonstrated a strong indirect effect on information distribution via information acquisition (β = .71). Similarly, the indirect effect of transformational leadership (via information acquisition and information distribution) on information interpretation was found to be statistically significant, positive and strong (β = .61). The total effect of transformational leadership on behavioral and cognitive changes, which includes direct and indirect effects, amounts to .79.

The direct and total effects of the transformational leadership on the four organizational learning constructs are summarized in Table 3.

293

Table 3: Standardized Direct, Indirect, and Total Effects of the Three Types of Leadership on Organizational Learning

Construct	Transformational leadership		
	Direct effect	Indirect effect	Total effect
Information acquisition	.72	---	.72
Information distribution	.00[n.s.]	.70	.70
Information interpretation	.00[n.s.]	.61	.61
Behavioral and cognitive changes	.50	.29	.79

All structural coefficients (except those marked) statistically significant at p>0.001

n.s. - not statistically significant

--- - not specified in the model.

5 DISCUSSION AND CONCLUSIONS

5.1 Implications for theory

This study's objective was to examine the influence of transformational leadership on the organizational learning process. Our hypothesis was confirmed, by only partially. Transformational leadership affects all phases of the organizational learning process. However, it only directly influences the beginning and ending phases, namely information acquisition, and behavioral and cognitive changes. The two other phases of organizational learning are only affected indirectly. One explanation may be that there is great correlation between the first three phases (the information-processing part of organizational learning). The structural coefficients between information acquisition and information distribution, for example, range from .90 to .98 in the three models we tested. Similarly, the structural coefficients between the information-distribution and information-interpretation phases range from .88 to .94. The information-processing phases of organizational learning process are quite related. Nevertheless, they are distinct constructs as proved by both theoretical arguments (Huber 1991) and empirical research (e.g. Perez-Lopez, Montes-Peon et al. 2005; Skerlavaj, Indihar Stemberger et al. 2006).

The influence of leadership is greatest on behavioral and cognitive changes, which are the final and apparently also the most important phase of the learning process in organizations. The total effect of transformational leadership on behavioral and cognitive changes amounts to .79, Leadership influences behavioral and cognitive changes in two ways. First, it affects them through the previous information-processing phases of the organizational learning process. By facilitating or impeding information processing in an organization, leaders achieve or impede changes in the mentality or behavior of organizational members in order to address changes in the internal or external business environment. However, leaders also influence changes in behavior and cognition directly, over and above the indirect influence through information-processing phases. This is to be expected as leadership is a relatively comprehensive process that guides, structures and facilitates all aspects of activities and

relationships in a group of people so as to guide, structure and facilitate the activities and relationships in the group.

5.2   Implications for managerial practice

New information and knowledge is constantly emerging from sources within and outside the company. Channels and conduits for their distribution are evolving. There is continuous pressure to interpret this information in ways that allow for understanding and exploiting emerging business opportunities. We consider changes as an integral part of the organizational learning process. At the same time, behavioral and cognitive changes are also its most important element. Collecting, spreading and understanding information is a futile endeavor if there are no resulting changes.

The role of leadership in this context is crucial. Above all, leaders need to promote learning at all levels and create opportunities for people to acquire information from heterogeneous sources while leaders have a particularly strong impact on the acquisition of information. Leaders also need to establish opportunities for employees to distribute information, meet, discuss ideas and facilitate interpretations based on wider perspectives. By emphasizing the company's vision and mission, personal encouragement and empowerment leaders need to stimulate employees to act upon this information and support changes that contribute to organizational performance.

Our research also suggests that there are some elements of the organizational learning process which leaders can influence directly, while other elements can only be influenced via indirect means. From this perspective, the information-acquisition phase seems to be crucial. It is of the utmost importance for leaders to facilitate and encourage employees to use all of the available sources, channels and means of both internal and external information acquisition. They should create opportunities for people to meet and talk, be alert to changes in the business environment and above all create an open organizational culture whereby trust and cooperation are valued.

Finally, leaders should bear in mind that they have several mechanisms for influencing the learning process in their organization. This study has focused mostly on the actions and behaviors of leaders. However, organizational architecture, structure, processes, systems, rules, policies and especially culture are also powerful tools available to leaders. Depending on their power, position in the organization and the availability of resources, leaders should use all these mechanisms in order to build an organization that is able to continually learn and adapt itself to its environment, thereby ensuring a long-term successful performance.

5.3   Limitations and further research

This study makes several important contributions to the field. First, it integrates two previously relatively disparate fields of organizational learning and leadership. Second, it empirically proves that transformational leadership strongly impacts learning in organizations. Finally, it expands the scope of empirical research by examining leadership and the learning process in the context of a small transitional economy. By testing existing (predominantly Anglo-Saxon) theories of leadership and organizational learning in different cultural, economic and political contexts, it enhances the generalizability and validity of these theories and constructs.

On the other hand, some of the study's strengths are also its weaknesses. From the methodological point of view, the sample and context are always an issue. While we believe

that using Slovenia as a target population contributes to the research's generalizability, it also poses a limitation that needs to be accounted for. Expanding the research to other nations (with different national cultures, nations of different sizes, histories etc) would significantly contribute to our understanding of the link between leadership and learning.

The second key limitation is the cross-sectional nature of the study. It is possible that at least certain aspects of leadership and its impact on the learning process emerge with some kind of time lag. The longitudinal treatment of data might yield additional insights in our two phenomena and how they relate to each other.

Third, due to its low reliability we were unable to measure the higher-order factor of transactional leadership as specified by the MLQ. Instead, we used contingent reward leadership (which exhibited high reliability and validity) as a proxy for transactional leadership.

Fourth, we limited our research to the direct effect of leadership on organizational learning. Nevertheless, we acknowledge the fact that this impact might be attenuated using e.g. organizational culture and structure as moderating variables. Future research should extend our understanding of the leadership style as antecedent to the organizational learning process by involving some moderating and mediating variables.

Additional insights into this clearly intriguing area of research might be generated by using in-depth (preferably qualitative) studies to answer many of the 'hows' that might have emerged in this paper. While we have tried to explain why leadership matters for organizational learning and how it affects the learning process in organizations there is still a lot to be said about particular leadership mechanisms in relation to learning.

Appendix

Operationalization of Organizational Learning Constructs (List of Items)

Dimension/Constructs	Sub-dimension/Indicators	Items
Information acquisition (Infoacq)	Internal information acquisition (INTERNAL)	▪ Employees as an extremely important source of information (INFOACQ1). ▪ Previous decisions important for current decisions (INFOACQ2). ▪ Employees are encouraged to participate in formal and informal networks outside of the organizational unit and organization (INFOACQ3). ▪ Other organizational units are an important source of learning new methods and services (INFOACQ7).
	External information acquisition (EXTERNAL)	▪ Reports prepared by external experts as an extremely important source of information (INFOACQ4). ▪ When accepting an important decision our leader tries to get advice or information from sources of outside of the company (hiring experts, contacting managers from other companies) (INFOACQ11). ▪ Our organizational unit has employees whose job it is related to searching for external information (INFOACQ12). ▪ External sources (reports, consultants, newsletters etc.) are extremely important for the operations of our organizational unit (INFOACQ13).
	Training as information acquisition (TRAINING)	▪ Frequently organized internal trainings (INFOACQ9). ▪ In our organizational unit we often send employees to various seminars, workshops, conferences with the intention to acquire new information (INFOACQ15).

Information distribution (Infodist)	System-oriented information distribution (SYSTEM)	▪ Our information system allows for efficient and quality information exchange inside our organizational unit or company (INFODIST1). ▪ We have organized meetings to inform employees on a regular basis (INFODIST3). ▪ We have formal mechanisms and systems in place that allow for the transfer of best practices among various fields of activities (e.g. group-incentive plans) (INFODIST4).
	People-oriented information distribution (PEOPLE)	▪ All members of our organizational unit are acquainted with the goals of the unit and organization (INFODIST2). ▪ There are individuals within our organizational unit who cooperate in multiple teams or project groups with individuals from other organizational units (INFODIST5). ▪ We have individuals whose job it is to collect and internally distribute improvement proposals from our employees (INFODIST6).
Information interpretation (Intinfo)	Informal information interpretation (INFORMAL)	▪ Personal contacts – (INFOINT1). ▪ Team meetings – (INFOINT2). ▪ Committees as decision-makers – (INFOINT3).
	Formal information interpretation (FORMAL)	▪ Seminars, conferences, workshops… – (INFOINT5). ▪ Written memos, notes, letters… – (INFOINT6). ▪ Special expert reports – (INFOINT7). ▪ Forums (e-chat, e-debates) – (INFOINT10).

Behavioral and cognitive changes (Bcc)	Behavioral changes (BC)	• Adaptability to environmental pressures - (BCC1). • Quality of products/services - (BCC2). • Number of products/services offered - (BCC3). • Technology of operation - (BCC4). • Speed of operations - (BCC5). • Introduction of new marketing approaches - (BCC6). • Average productivity of employees - (BCC7)
	Cognitive changes (CC)	• Satisfaction of employees - (BCC8). • Overall atmosphere - (BCC9). • Personal communication between top managers and employees - (BCC10). • Team meetings' efficiency - (BCC11). • Employees' level of understanding of the company's strategic orientation - (BCC12). • Employees' level of understanding of major problems in the company - (BCC13).

Key words: *Corporate Social Responsibility (CSR), Corruption, Corporate image, Competitiveness*

1. INTRODUCTION

In recent years, the concept of Corporate Social Responsibility (CSR) became one of the main priorities of the EU policy. European Commission presents the view that the introduction of CSR in corporate management leads to a more stable growth of companies, and it could play a significant role in the achievement of goals and objectives defined in Lisbon Strategy. The Commission's position on this issue is most extensively expressed in the so called Green Paper of CSR. It defines the corporate social responsibility as an idea that firms adopt the development strategies that take into account not only the social interests and the environment, but also try to cope with the interests of all stakeholders.

This publication induced a widespread debate about the ways in which the EU could promote the social responsibility, and in particular the way it could encourage the companies of member countries to introduce pro-social, innovative methods of management and to improve the transparency of business practices. It has been stressed that undertaking such actions on a larger scale than required by legal regulations could contribute to an increase in company's competitiveness, and the CSR concept should become an integral part of strategic management.[1] The document considers also a very important issue of involving the small and medium size firms in the corporate social responsibility. European Commission points out that CSR programs should be implemented not only by transnational corporations, but are expected to become an important element of the smaller firms strategy across the European Union.

The debate started with the publication of *Green Paper* (2001) lead to the publishing of the so called *White Paper* (2002). This document besides summarizing the results of the earlier public discussion focuses on four main areas of corporate social responsibility which require EU involvement. These are:

- education, i.e. an increase of knowledge about CSR through an exchange of experience and best practices between individual companies as well as between the member states,

---

[1] See *Green Paper* (2001).

- promotion of transparency and convergence of procedures and tools implementing CSR, i.e. popularisation of the codes of ethics, management standards and the principles of auditing and reporting,

- creation of European Multi-Stakeholder Forum on CSR,

- introduction of CSR to all EU policies, i.e. employment policy, environmental policy, consumer policy, trade development policy, and overall economic policy.[2]

One of the most important initiatives that resulted from the Lisbon Strategy was the project "European Initiative for CSR – 2005". Its main goal was to win 500 thousand companies and business partners for activities helping promote CSR by the end of 2004. The primary idea of the initiative was to send a message that "CSR is a market strategy that works and gives firms an opportunity to achieve a substantial competitive advantage."[3]

This initiative provided an easy access to practical solutions in managing CSR and to the set of instruments that allow companies to fully utilize their resources by doing business compatible with the idea of social responsibility.

The following projects constitute the key elements of the initiative:

- European CSR Academy – a platform for a dialog between business and academia. Its main goal is to stimulate research on measurable market reasons for CSR in firms' activity, an increase of educational level about the CSR principles at the European universities.

- SRI Watch – Socially Responsible Investment Watch, i.e. an internet data base that contains information on all funds and indicators used in Europe in the field of environment protection and business ethics.

- SME Key – an internet tool that encourages the small- and medium-size enterprises to engage in CSR through a vast number of informational material and a rich collection of case studies. It shows the benefits of implementing this idea in the firm's divisions, company's organizational culture, as well as in the individual branches of the economy.

The question that we pose is about the extent of knowledge and understanding of the CSR concept among Polish firms and consumers.

2. POLAND AND THE PROBLEM OF CORRUPTION

Before we analyse the perception of the CSR idea by Polish producers and consumers, the problem of corruption should be mentioned. First of all there are many historical reasons in ambivalent approach to corruption in the Polish society. They have been specified in The

---

[2] See *White Paper* (2002).
[3] Compare Greszta (2001).

World Bank Report on Corruption in Poland – An Overview of the Most Important Fields (2000). It should be noted that Poles in spite of strong feeling of national identity have relatively weak public spirit.

There is a general opinion that Poland is perceived as a corrupted country. But some statistics show that only 1.6 per cent of firm's revenues comes from bribes, that is less than the average in the region of Central and Eastern Europe equal to 2.2 per cent.[4]

The bad image of Poland as a corrupted country comes to some extent from the past in totalitarian system in which corruption and bribery were the essence of its functioning. The same problem is being reported in other countries in the region of Central and Eastern Europe.

Table 1. Corruption perception ranking of selected Central and Eastern European countries.

Rank	Country	Rank	Country
27	Estonia	70	Poland
31	Slovenia	85	Romania
44	Lithuania	107	Belarus
47	Czech Republic	107	Ukraine
47	Slovakia	107	Kazakhstan
51	Latvia	126	Albania
70	Croatia	126	Russia

Source: Transparency International, Global Corruption Report 2006.

It is worth mentioning that the degree of corruption in Polish business environment is not perceived by Polish firms as more severe than in other European countries. The latest research conducted by Prince of Wales International Business Leaders Forum (2002) shows that only less than 1/3 of respondents out of 500 biggest Polish firms are convinced that the business environment in Poland is more corrupt than in other European countries. The remaining more than 2/3 of them believe that the level of corruption in Poland is the same or smaller than in other countries in Europe. It should be mentioned that all of the questioned firms are intensively engaged in international trade. The same research shows that the accession of Poland to EU reduced the perceived internal risk of corruption within the firm.

□ **Lower** ▣ **Relatively lower** □ **Same** ▨ **Relatively higher** ▦ **Higher**
Figure 1.How Polish managers perceive corruption in Poland in comparison to other European countries?

---

[4] Compare, e.g.., Hellman, Jones, and Kaufman (2002).

There are many institutions in Poland that actively educate business circles how to fight corruption. Among those heavily involved are: Helsinki Foundation, Stefan Batory Foundation, Transparency International, Corporate Social Responsibility Forum etc.

Since 1999 Poland is also a signatory of Anti-corruption Convention OECD, and since January 2006 the Central Anti-corruption Office (an independent governmental agency with a wide range of competence) started its operations with some spectacular successes.

3. THE PERCEPTION OF THE CSR IDEA BY POLISH CONSUMERS AND PRODUCERS

The report "Economic Consciousness of the Society and the Image of Business" published by the Institute of Public Affairs in 2004 shows the degree of sensitivity of Polish consumers to various social engagements of firms.

- More than 2/3 of respondents (68 per cent) declare that they purchased products of a given firm, because part of the revenue was earmarked for an important social cause, e.g. charity.

- Almost half of the respondents (48 per cent) admit that they purchased a given product because the producer showed concern about the natural environment (e.g. the firm uses packaging based on recycled material or is not testing its products on animals).

- Similar share of respondents (46 per cent) admits that at least once they chose product because the producer was a sponsor of a cultural or a sports event.

- The remaining respondents that never used any of the above criteria in their decisions about purchases usually justify their behaviour with the lack of knowledge on this subject, but not the negligence of the social issues.[5]

The analyses of the above results provides the evidence of a rapid increase of consumer consciousness in Poland and their sensitivity to social issues while making the purchase decisions. Thus, it is worth investigating whether Polish companies are ready to meet those demands. According to the 2004 report of the Centre for Business Ethics, 99 per cent of managers declare that it is very important to apply ethical principles in a firm, and almost 2/3 of them is of an opinion that ethical behaviour contributes to a business success through an improvement of organizational culture and strengthening of the firm's image.[6]

It is also important to recall that the development of the CSR idea is especially slowed down by the existence of corruption and widespread economic crime that is perceived among the business people.

---

[5] See *Świadomość ekonomiczna społeczeństwa i wizerunek biznesu* (2004).
[6] Compare Badanie Zespołu Etyki Życia Gospodarczego, IFiS PAN, and Centrum Etyki Biznesu WSPiZ im. L. Koźmińskiego (2004).

At the same time the first national report on the ethics of Polish firms in 2004 based on the sample of 800 companies shows that:

- Only 41 per cent of respondents believe that it is possible to avoid unethical business activities.

- 45 per cent of them believe that ethical behaviour is possible in most of the cases.

- 13 per cent of respondents are of an opinion that it is not possible to maintain the long-run market position without using unethical measures.

- Responsible business dealing is more often attributed to state companies (53.6 per cent) rather than to private firms (28.8 per cent), and to the Polish firms (56 per cent) rather than to the foreign companies.[7]

Research conducted by the Responsible Business Forum in February 2005 on a sample of 1024 respondents shows how Polish consumers perceive the idea of responsible business and the motives attributed to Polish firms undertaking such activities. The key results of the research are:

- The vast majority of Polish consumers (68.8 per cent) views as a responsible business the ethical conduct associated with company's activities, i.e. ethical treatment of employees, business partners, and clients.

- According to respondents, the main reasons of fair and ethical behaviour of companies are:
    - personal characteristics of management (39 per cent),
    - profitability of such actions (30.6 per cent),
    - social expectations (9.5 per cent),
    - EU requirements (7.1 per cent).

- The motives attributed to social engagement of firms are perceived as:
    - profitability of such actions (51.3 per cent),
    - management's sensitivity to social issues (22.8 per cent),
    - social expectations (12.8 per cent),
    - EU expectations (3.7 per cent).[8]

The 2004 Report of the Centre for Business Ethics points out that:

- 80 per cent of companies views social norms as the ethical standards, and they lack any documents regulating these issues.

- Among the firms that do not have written Codes of Ethics around 55 per cent plan to introduce such codes in the nearest future, but 37 per cent have no intention to publish a written code.

---

[7] See Badanie Zespołu Etyki Życia Gospodarczego, IFiS PAN oraz Centrum Etyki Biznesu WSPiZ im. L. Koźmińskiego (2004).
[8] See *Odpowiedzialny Biznes w Polsce 2004* (2005).

- 2/3 of the firm declares lack of any training in business ethics.

- Above 70 per cent of managers believe that the implementation of the CSR idea is strengthening the brand name and creating the positive image of the firm, and conducting activities within the framework of the Cause-Related Marketing (CRM).[9]

- Only 30 per cent of managers in Poland understand that CSR constitutes a comprehensive management style that requires building a firm's complex strategy based on the idea of social responsibility, and not just undertaking occasional activities.[10]

4. A COMPARISON OF ATTITUDES TOWARDS CSR IN POLAND AND OTHER CEE COUNTRIES

In the first quarter of 2005, the World Bank and the European Commission conducted a survey of attitudes towards CSR in Central Europe. The sample consisted of 154 firms from Poland, 150 from Hungary, and 150 from Slovakia. The firms' selection was based on the level of turnover and the number of employees.
Figure 2.   Interpretation of the CSR concept.

The understanding of the concept of responsible business differs from country to country. In Poland, 80 per cent of managers view CSR as ethical behaviour. In Hungary, 65 per cent of managers believe that CSR means obeying the legal regulations. In Slovakia, almost 60 per cent of managers consider CSR as coping with the stakeholders' concerns.

---

[9] *Cause-related marketing* is a strategie of building the image of a company in relation with the sponsorship of charitable organizations, NGOs, social or ecological organizations. See, for example, Kotler, and Lee (2005).

[10] Kietliński, Reyes, and Oleksyn (2005).

All Polish, Slovak, and Hungarian firms define their main stakeholders in a similar way, i.e. shareholder, clients, and employees. The Hungarian, and Slovak firms believe that the next important stakeholder is their government, but Polish firm indicate local communities before the central government. It should be noted that NGOs are not considered as an important stakeholder in any of the analysed countries. It would be worthwhile to compare these definitions with the list of most important social partners for the companies listed included in the Dow Jones Sustainability Index. Sustainability Asset Management Research showed the following ranking: shareholders (100 per cent), local communities (94 per cent), government (83 per cent), suppliers and service providers (61 per cent), labour unions (61 per cent), NGOs (56 per cent), and media (50 per cent).

The codes of ethics are most popular in Hungary, where 60 per cent of firms put the rules of conduct in writing. However, in Hungary, there is the smallest number of regulations preventing corruption, and the highest number of rules concerning the financing of candidates for public positions.

Polish and Slovak companies exceed the Hungarian ones in implementing non-discriminatory practices in the recruitment process. Hungarian firms prefer engagement in technical training, housing, and support of ethnic minorities. In all three countries, the main beneficiary group of social projects are young people. Although Poland has more advanced projects in the environmental protection it has less achievements than Hungary and Slovakia in educational activities in this field. The programs of utilizing recycled materials are widespread in Poland and Hungary, where over 70 per cent of firms introduced such programs. In Hungary more than 41 per cent of companies have been granted environmental certification.
Figure 3.   The main barriers to implement CSR.

The lack of relevant legal regulations is considered to be the main barrier to the CSR implementation in all discussed countries. Hungarian firms complain about the lack of relevant institutions, clear results, and an excessive focusing on the short-term benefits. Slovak firms stress mainly the costs as the barrier to the CSR implementation. Polish as well as Slovak enterprises more than Hungarian ones see the significant risk of including social consideration in doing business. In particular, they name potentially higher operating costs and the negative impact on the firm's profitability.
Figure 4.   Risks associated with the implementation of CSR.

More than 95 per cent of companies in all surveyed countries believe that the most important internal benefit of CSR is stable long-run firm development. Hungarian and Slovak enterprises more than Polish ones perceive the rise in productivity, quality of products, and the sales revenue as the results of ethical business practice. Although the firms in these countries differently assess the internal benefits of CSR, they all agree that the main external gain is an increase the firm's reputation and, indirectly, balanced development of the entire economy.

In all surveyed countries, there is similar assessment of activities that could help in the introduction of CSR. Almost all firms (95 per cent) indicated the loan subsidies, greater role of local governments, tax exemptions and the recognition by the business partners as the main factors encouraging the implementation of CSR practices.[11]

---

[11] *Enabling a Better Environment for CSR in CEE Countries Projects*, FOB Conference, Warsaw, November 7-8, 2005.

5. CONCLUSIONS

Analyzing the degree of internalization of the CSR idea in Polish companies it is necessary to remember that it still faces many barriers in the form of complicated tax system, high costs of labor, unstable regulation of economic activity, widespread corruption etc. On the other hand, any attempts of companies to engage in socially responsible programs are perceived as a campaign to build firm's image, and not as a sign of social sensibility and an integral part of a company's long-run strategy aimed at a balanced development.[12]

In many, especially small- and medium-size enterprises, the issue of CSR and the problems related to business ethics are not perceived as a chance to enter a new area of competitiveness, innovations and broadly understood quality orientation, but rather a source of costs and troubles, redundant and not very constructive moralizing. International certification of CSR is not very much known in Poland.

At the same time it is worth remembering that Polish business environment is significantly less developed than in the old members of European Union, therefore any sign of implementation of CSR, even just for the sake of an image campaign, should be warmly welcomed. If Polish firms will engage in the CSR only because of the outside pressure, e.g. from the EU, or because of the willingness to improve their image, this concept will never become anything more than just a noble idea, and will not be a significant factor of business-life improvement in Poland.

A sign of real internalization of the CSR idea in Poland will be a change in the management style and a practical implementation of the integration of social policy with the overall firm strategy through an introduction of socially responsible management model.[13] Effective strategies of implementing CSR should take into account the interests of all stakeholders of the firm. The activities that are aimed at building the image ought constitute its integral part, but should not be considered the most important ones. Otherwise Michel Porter is right to warn that "CSR is a religion with a large number of priests that requires neither proof nor theory".

Key words: *social responsibility, banking system, sustainable development, general public, foreign owners*

1. INTRODUCTION

Social responsibility as a beginning of a new approach that should, including many other factors, result with secured sustainable development is the key for catching up of the developing countries such as Croatia. The problem of low level of social responsibility is very visible in Croatian banking system. Banks in Croatia have passed through several different phases just like banks in other central and Eastern European countries (CEE) that have passed the transformation from socialism to capitalism. We can see that there were three main phases that banks in Croatia went through; sanation which was made by government financed from citizens' money, than phase of fitting into global trends such as deregulation and increasing capital mobility at the end of this intensive process banks in Croatia come up with new foreign owners, strengthened and able to influence structure of national investments. This phase was characterized by rather substantial increase of offers of new financial instruments to general public and decrease of offers to economic subjects that are supposed to be the ones that should carry production and development of whole country.

Was that the trigger that made Croatian central bank intervene in order to change these trends? What is the real situation in Croatian banks and how socially responsible are they? These are the questions that this article will answer.

The purpose of this paper is to show how low social responsibility in goals of Croatian banks effects negatively on the development of the country.

2. HISTORICAL BACKGROUND OF CROATIAN BANKS

How did it happen? How did the Croatian banks become owned by foreigners? The whole story can be presented through 3 phases:

The 1st phase can be called the phase of foundation and it took place from early years of 20th century until 1995. What we can say about this phase is that Croatia and other CEE countries had started to build national banking sector at the same time when some western European countries started to enter international markets. The market of the banks in that period was focused on corporate banking while the consumer banking was still undeveloped.

The 2nd phase is called privatization because the period from 1995 until 2000 was mainly characterized by privatization of state owned banks. In this particular moment, foreign banks have entered Croatian market buying some local banks. During this process, that took place at the end of the war that was going on in Croatia, several new local banks went through bankruptcy. Opening of this market to international participations increased competition in corporate banking and also retail banking market showed rather fast development.

The 3rd phase of consolidation has started in 2001 and it is still in progress. Characteristics of this phase are increased competition among new owners and formation of new strategic plans of international banks in Croatia. At the same time there are many changes in structures and needs of consumers of banking products. For example, small and medium enterprises (SME), as a market segment start fast growth and need banking institutions to follow their financial needs. However, access to bank loans generally or at affordable terms is granted to only 80% of SME.[1]

Maybe the best way to show these phases is through figures.

Table1. Investment structure of the Croatian banks in 3 dates from 3 different phases

	December 1993		December 2000		December 2005	
DOMESTIC CURRENCY LOANS	**Millions HRK**	**%**	**Millions HRK**	**%**	**Millions HRK**	**%**

Figure 3.   Structure of loans in Croatia in December 2005

319

In 2005 commercial banks granted credits in the total amount of 154.929,7 millions HRK (both denominated in Croatian kunas and foreign currencies). In comparison with the end of the 2004 year the growth of total amount of credits has been 20,3%. At the end of 2005 the share of credits granted to the enterprises was 40,07%.

It becomes very visible that banking industry has changed its orientation from predominantly supporting of enterprises, which is generally held as loans for production and development, to expansion of loans to general public.

This "unlimited" expansion of loans to general public gives an impression that current bank owners do not consider their profit in longer period. Requirements for sustainable development are not possible to be completed unless the bank system becomes more long terms orientated.

2.1. Banks in Croatia today

In order to understand better the motivations of currently present banks in Croatian financial market it is useful to know who we are and in what way we are dealing with in this moment.

Financial market in Croatia is dominated by banks. They are holding over 79% of total assets of financial institutions. Other financial institutions are still developing. That underlines the importance of banking system for Croatia. According to the Banks Act, a bank is a financial institution established as a public limited company with headquarters in the Republic of Croatia.[2] The establishment is based on a licence issued by the Croatian National Bank (CNB). The minimum amount of authorized capital required to establish a bank is 40 million HRK. A bank must follow the principles of liquidity and solvency, and the minimum rate of capital adequacy must be at least 10%. The law says that both direct and indirect acquisition of a bank's shares in an amount which secures capital interest or voting rights must be approved by the Croatian National Bank beforehand, specifically: if 10% or more (a qualifying holding), 20% or more, 33% or more, 50% or more and 75% or more shares are acquired. A bank conducts business on the basis of an adequate licence obtained from the Croatian National Bank (CNB). Along with banking services, it can also provide other financial services, provided it gets a licence for it from the Croatian National Bank. Banking services include receiving cash deposits, granting loans and other investment of funds in one's own name and for one's own account, as well as issuing means of payment in the form of electronic money.[3]

Foreign ownership share of total assets in 2005 was 91,3%, 14 banks are either fully or majority-owned by foreign entities and two banks are fully or majority-owned by the state. That is the result of processes showed before but facts for themselves are not the ones that show level of social responsibility but the previously shown trend of increasing loans to general public. Finally we can consider entrance of foreign banks into Croatian market as a very important foreign investment, witch could be considered as positive for domestic economy.[4]

[4] Galac T., Kraft E.(2001)

2.2. Asymmetry of knowledge

In banking and financial sector we usually deal with asymmetry of information[5], but in case of relation between bank and general public sector it is not only that kind of unbalance that exists as a problem between positions of these two subjects involved. Maybe even greater problem is "asymmetry of knowledge" by which we mean the lake of proper education of general public in use of new financial instruments. If we know that only 7% of people in Croatia have university or collage degree, and that some things connected to financial offer of banking institutions are not even understandable for this small pattern of people belonging to this part of population. Reasons are historical but it does not mean that we should ignore them. Transition in Croatia was very fast and it also took place during the war in Croatia. Since the population in economies in transition did not have possibility to prepare and educate themselves, generally they are not able to be completely reasonable and to understand completely all elements that can come up from taking an obligation as loan is. How loans are presented makes also difference. Sometimes there is too much unimportant information offered instead basic ones that are really important. For example, most banks underline nominal interest rate and only with small letters beneath all kinds of less important information put the information about effective interest rate.

If there was a better regulation that should control communication between bank and costumer from general public, and if there was some kind of public service organized and conducted by government in order to consult and educate general public, this kind of "asymmetry of knowledge" should be minimized.

The banking system in Croatia has many challenges to meet ahead. The way that banks choose to deal with new problems will determinate also their position in context of social responsibility. The new strategies that banks will take will also determine how important for them will be interaction with the society. And on the other hand government's responsibility is to take care and protect interests of its own citizens.

3. THE GOALS OF THE CROATIAN BANKS

The main goal for the bank as institution is a profit. Social goals are not primary for the bank but in a way bank is a "public good", because it fulfills many public interests and demands of the community. In terms of social responsibility we could say that bank shows traces of socially responsible functioning if they do not discriminate anyone and provide their services to all members of the community. Above that there is also the bank's stability, safety, price efficiency and also bank's profitability, since bank pays contribution on its profit, so high profit brings more contribution.[6]

But is this satisfying approach? When we analyze strategic plans of banks we can talk about social responsibility from completely different prospective. Bank that plans to work in this area in long terms has to have more feeling for social responsibility. What do we mean by that? Answer is simple if one plans to make a profit in short terms, one doesn't have to care what happens in long terms, but wanting to make a profit in long terms, one has to be aware

---

[5] Pojatina, D. (2006)
[6] Leko, V. (2004)

that his investments should do some good to general public by increasing productivity and investing in development.

We could say that distribution of bank loans can give as rather clear picture on how they plan their future in Croatia.

Marketing goals of the banks can sometimes look as a socially responsible actions and there not to be underestimated. For purposes of creating their own positive image[7] banks are financing many socially important events and activities. This does some good to banks and also does some good to general public. Anyway it is very positive and although it has been done exclusively for marketing purpose it provides some benefits to the general public.

4. LOANS STRUCTURE OF CROATIAN BANKS TO GENERAL PUBLIC IN COMPARISON WITH BANKS OF SELECTED COUNTRIES

Many eminent experts will agree that the problem is not only negative, in context of sustainable development, distribution of bank loans, but the structure of loans to the general public makes story even more dramatic.

Table 2. Loans to general public USA at the end of 2004

BANK FACILITIES	BILLION in USD	%
Total	13.543	100,00
Housing loans	9.701	66,70
Personal loans	2.151	14,80

The distributions of loans can be better seen from figure 4.

---

[7] Tomašević Lišanin, M. (1997)

The structure of loans to general public in USA
The structure of loans to general public in EU
The structure of loans to general public in Croatia
Figure4. Comparison among structures of bank loans in; USA, EU and Croatia

If we compare data from these diagrams we can say that the structure of the loans for general public in USA and EU countries are pretty much the same. Great majority of general public loans are distributed for housing loans, little more than 10% is being spent on different "consumers' loans", and less than 20% is to be spent on different goods. In Croatia things look much different; housing loans take only little bit more than 30% of the whole amount that is distributed for loans to general public, and what is even more scaring is that "consumers' loans" take more than 45% of all loans to public. It shows how people in Croatia, as in other transition countries have urge to consume beyond there actual possibilities, and how banks take advantage from that situation. Reason of this "consummation hunger" could be found in a sudden opening of the market in Croatia to export of the different goods that were not so easily accessible before in times of socialism.

In democratic countries everyone should be able to decide freely how to spend money that one earns, but as for example in Australia, banks should be obligated to show them what are there realistic possibilities and not to make them poor.

Things are getting even worse from year to year. In 2006 from data collected by Croatian National bank (CNB) red alert is to be switched on, the growth of bank loans to general public goes beyond 24%. The CNB has answered with new regulations that will be effective from the beginning of 2007, and basically they should stop the growth of the loans in total on the level of 12% because every percent of the growth beyond 12% would produce more costs than benefits to the banks. CNB has installed this measure in order to stop growth of loans to general public but by the lows and regulations of EU all regulations have to be applied to all sectors, meaning that rules have to be same whether loans are to be consumed in general public or in small and medium enterprises. Banks have already answered that their response to this measures is going to be increased interests on loans to enterprises. This kind of response gives as a clue on how high banks steam CNB and how inefficient are the "legal tools" CNB has in disposition in order to make banking system more socially responsible.

Among new documents issued by CNB one that is bringing more order in relationship between banks and general public is the one consisted from guidelines for managing the credit risk that is occurring as a result of issuing loans to the general public. Many articles are putting order into market but some of them are very discussible from social responsibility point of view. In particular the article that defines that maximum of monthly payments to the banks are on the same level as monthly income one has.[8] Many existing lows and regulations are to be improved if we want them to work better for booth; general public and banks.

---

[8] Hrvatska narodna banka (2006).

5. CONCLUSION

The situation is very serious and it demands immediate actions. Loans to general public are going wild and they are threatening to cause financial collapse and poverty of general public in Croatia. The causes are to be the first ones to be defined. Taking in consideration what was earlier stated in this article the causes could be:

- Lack of efficient legal instruments that Croatian National Bank has to make order in banking sector.

- General public is not educated enough to be left on its own in making financial decisions.

- Government through Ministry of Education and Ministry of Finance or some other services did not try to educate people in order to prepare them to use new financial products and to protect them.

Someone could say that the profit is always going to be on the first place for the banks but if we put bank goals in long term prospective we could conclude that the bank which plans to exist on one market for longer period has to modify its strategies. By making restrictions in expansion of loans to general public and by distributing more loans to enterprises, bank does not only show high level of social responsibility but at the same time protects its own long term interests.

This has not been the way that banks usually think but in order to achieve this it would be very useful to have the legal instruments to make them think and act differently. Croatian National Bank is trying to make a difference but the instruments they have on disposal are not efficient as they are supposed to be. Maybe the one of legal instruments that could work in this situation could be some kind of "time restriction", meaning, definition of minimum time that one bank entering in Croatian banking market has to stay before withdrawing its capital.

Maybe the idea of Croatian Chamber of Economy, that has created Code of Ethics in 2005 for all members, is a very good one to be applied in banking sector in Croatia. Code of Ethics proposed to members contains ethical regulations that members should respect in order to achieve more efficiency but taking in consideration sustainable development and care for environment wellbeing.

Some eminent Croatian experts and researchers have agreed that it will never become a goal of one foreign owned bank and that the only possibility is to make a strong domestic bank that will create different strategies.[9] But the reality is that we in Croatia live in environment created predominantly of the foreign owned banks and we should have the instruments to make them think and act differently.

Also big responsibility is to be taken from different government structures in order to educate and help to majority of general public to use financial instruments as they can, and not to help them become poorer and more dependent upon social care. Without proper education of majority of population especially in dealing with finances poverty is inevitable.

---

[9] This opinions were presented at annual Conference of Croatian Economists Society in Opatija in 2006. www.slobodnadalmacija.hr , (acceded 1.12.2006).

Just to conclude this paper in spirit of optimism which is also necessary to be creative, we would like to underline that this year Nobel annual award has been awarded to a men who believed in different concept of banking system. Banker and economist from Bangladesh Muhammad Yunus has shown to the whole world how socially responsible one banker could be. By giving micro credits he managed to have impact on whole community and managed to decrease poverty in his surrounding. With his Grammen Bank he has managed to inspire many people all over the world and we can only hope that bankers in Croatia will be able to sense some of this "socially responsible vibrations".

1. FERTILITY TRANSITION IN SLOVENIA AND CROATIA AND ITS IMPLICATIONS

The main demographic concern of the developed countries is fertility decline and population ageing. The pace and persistence of fertility transition from higher to lower fertility rates is a world wide phenomenon with no precedence in a human history. The developed world fertility rate has been continuously declining in the last decades. In Slovenia fertility rate has been declining for more than last 100 years and the situation in Croatia has been similar. From 1970 and 1995 the percent of all world countries with total fertility rate equal or greater than 4.5 fell from 60% to 40%. During the same time period, the percent of all world countries with total fertility rate lower than 2.5 increased from 17% to 33% (Bulatao and Casterline 2001). Therefore, fertility transition is the transition process from the state of high to the state of low fertility rate which is not high enough even to ensure the simple reproduction of a population. The start of a fertility transition is considered as a decade in which the decline in fertility rate compared to the fertility rate in the previous decade is lower for at least 10%.

Fertility is normally measured by the total fertility rate which is a long-run indicator of a population reproduction. Age specific fertility rates (f_x) measure the number of children that the average woman has born between her x^{th} and $(x+1)^{th}$ birthdays. We define age specific fertility rate as:

$$f_x = \frac{B_x}{P_x^f}$$

where B_x denotes births in year t pertained to women aged x at the time of birth and P_x^f denotes mid-year population of women aged x. The superscript f denotes that we are only

considering women. Total fertility rate (*TFR*) is than defined as a sum of the f_x over the women ages between 15 and 49 years:

$$TFR = \sum_{x=15}^{49} f_x$$

It measures the total number of children per a woman in her life under the condition that she survives until age 50 years, which is the end of the fertility period. If the value of total fertility rate per woman is less than 2.1, a woman has less than 2.1 children, meaning that she is less likely to provide at least one girl to replace herself or to assure a simple reproduction of a population. Total fertility rate is a long run indicator of fertility (Hinde 1998, 100).

In Figure 1 we can see recent and projected developments until 2050 in total fertility rate in Slovenia, Croatia, Europe and the World.
Figure 1. Total fertility rate in Croatia, Slovenia, Europe and the World, 1996-2050.

We can see that total fertility rate has been declining over the whole observed period. It is projected to recover in Slovenia, Croatia and Europe where the number of children per women has almost reached its minimum. But in the global world context the total fertility rate is projected to decrease until 2050 and even later on, due to the decreasing total fertility rate in developing countries, where the current fertility rate is on a higher level.

Another most commonly used measure of fertility is a crude birth rate, which is defined as the average number of life births per 1000 population in a chosen year and location. It is considered as a better measure than the absolute measure of life births, but is strongly influenced by the age and sex structures of the population in the denominator of the ratio (Hinde 1998, 95-96). Considering that t is a given calendar year, B_t is the total number of births in year t and P_t is the total mid-year population, we can calculate the crude birth rate (b_t) as:

$$b_t = \frac{B_t}{P_t} * 1000$$

From the comparison of Figures 1 and 2 it is confirmed that total fertility rate is a long run indicator of fertility. Even if the values of total fertility rates start to increase after a certain point in time point, the crude rates of fertility are still projected to decline even after that time until 2030 in Slovenia, Croatia, and Europe, but for the world as a whole at least until 2050.
Figure 2. Crude birth rates in Slovenia, Croatia, Continent of Europe and the World, 1970-2050.

Fertility, mortality and migration are the three determinants of population age structure and its changes. Mortality is not increasing and so far remains stable in most of the developed countries. In less developed and developing countries mortality is even decreasing due to the improved overall life conditions contributing to the population ageing. On another hand, migrations in Slovenia have contributed slightly to the rejuvenation of the population since Slovenia has been net immigration country of especially younger workers during the last decades. In Croatia there are negative net migrations that are causing an outflow of younger working population contributing additionally to the population ageing. However the persistent and quite dramatic decline in the fertility rate in the last decades remains the most important factor of population ageing. As we can see in Figure 3, the share of people younger than 15 years in the whole population (represented by dotted lines) has been decreasing and the share of those aged 65 and more in the whole population (represented by solid lines) have been increasing in Slovenia, Croatia, Europe and the world. It is projected to continue similar patter until 2040. After 2040 the proportion of young population is projected to increase slightly, but the increasing proportion of old is projected to continue further on.
Figure 3. Share of population younger than 15, and aged 65 and more in Slovenia and Croatia 1974-2005.

The declining fertility and the consequent population ageing in Croatia, Slovenia and in the world are important research and policy issues, because the implications of the population ageing are resulting especially from the severe fertility decline. They are related to the economical, political, cultural and broader social environmental implications. Aggregate wage costs tend to be pushed up by labour force ageing in a case that current earnings differentials by age are maintained (Johnson and Zimmermann 1992, p. 5). Allocation of labour will be less optimal within a country since rates of regional migration are the highest among young adults, and decline with age increases until retirement (Champion et al. 1998, p. 65). Aggregate participation in labour market and average hours worked are expected to decline. The increasing share of older people is traditionally less active than younger and those of mature age (Productivity Commission 2005). Demand for education of children will decrease and demand for health service will increase. Pension system will need to be reformed due to the increasing dependency ratio. There is no doubt that the declining fertility rate with all its consequences is an increasingly important issue. Therefore, we try to find an answer to the question what are the factors of the fertility decline. We review first the most commonly used models of fertility.

2. FACTORS OF FERTILITY AND FERTILITY MODELS

In the last hundred years different determinants for the fertility decline have been argued in the literature. The findings vary depending to specific social, economic or historical circumstances. Fertility rates of different countries started to decline after the mortality declines. Social changes, which are caused by the structural changes in the economy towards industry and services and urbanisation, are associated with the decline in mortality and the increase in the survival of children. Fertility started to decline as a result of increased survival of children, since it was not necessary any more to give birth to more children in order to substitute the ones who did not survive until the adulthood (Davis 1963). Fertility started to

decline also as a result of the increased costs of rising of children in the new industrialised and urbanised world.

Later on further research revealed that the reasons for fertility decline can not only be a socio-economic development and the consequent decrease of mortality because the fertility started to decline also in countries with a very different level of a socio-economic development. In some countries cultural factors such as language and religion were more important for the fertility decline (Knodel and Van de Walle 1979). Furthermore, there are mentioned factors of fertility decline like changes in traditional values, which occurred with the increased personal material wealth and secularisation and where society became more individualistic (Lesthaeghe 1983). Caldwell (1976, 1981) emphasized that one of the reasons for the fertility decline is also "westernisation", which means the diffusion of ideas about the nuclear families where children are net receiver of emotional and material benefits. Microeconomic factors such as relative costs of children compared to other goods, income of a couple and couple's preferences for children compared to preferences for other ways of consumption are the next group of factors for the decline of the fertility rate that were added later on (Becker 1960 and Schultz 1973). Easterlin and Crimmins (1985) developed a model where fertility depends on the number of children, which would be born if there were no contraception, on the desired number of survived children, and on the costs of birth regulation. This model first brings the institutional dimension in to the investigation of the factors of fertility. Availability and spreading of information about contraception emerged as another important factor, which contributed to the fertility decline. However, if parents want to have many children, the availability of contraception will not stop them from having them (Cleland and Wilson 1987).

Most important factors of the declining fertility rate in a so called second demographic transition, which is especially typical for Europe, are postponing of marriages, postponing of having the first child, the increase of consensual units and fertility in such units, the increase of divorces and similar (Lesthaeghe and Van de Kaa 1986). The importance of psychological factors in modern times is becoming more and more important.

According to the earlier model of Oppenhein Mason (1997: 433-454), fertility depends on the perceived probability of child survival, on the perceived costs and benefits, which come with children, and on the relation between the perceived costs (sociological, psychological and financial) of regulating the number of children and costs of regulating the number of births.

The role of different factors is changing according to the social, cultural and economical development of a country. We can divide factors of fertility on direct and indirect factors by the way of their impact on the fertility (Malačič, 1985: 85). Among *direct factors,* there is a commonly used classification, which divides direct factors into three groups. The first group of factors consists of those which affect the probability of a sexual intercourse such as age at entering into sexual units, duration of fertility period, voluntary and involuntary sexual abstinence, and frequency of sexual intercourses. The second group of factors consists of those which are related to the probability to conceive such as fecundity/infecundity from involuntary and voluntary reasons, use of contraception and similar. The third group of factors includes factors affecting pregnancy and birth like death of an embryo from voluntary and involuntary reasons (Davis and Blake 1956). Among *indirect factors,* there are biological, economic, social, cultural, and psychological factors. Biological factors are less important in a modern society and refer to the fecundity as the biological ability of male and female population to conceive a child. On the contrary, the sterility may be not only a result of biological factors, but also a result of social factors like sexual diseases, nutrition, alcohol,

abortion, breast feeding and similar. Economic factors refer to economic benefits and costs of children. A special attention has recently been devoted to the opportunity costs of bearing and rising children. If women have higher education or are more likely to have a job then the forgone earnings during pregnancy and later on, in the earliest ages of a child, are much higher, compared to the situation where women have lower education and are less likely to get a job in general. In such cases their expected potential earnings are lower and thus are lower opportunity costs of giving them up. Social factors include industrialisation, urbanisation, modernisation, socio-economic position of a family, employment and activity of women, education level of parents, social norms, values and standpoints, transformation of a family and intergenerational flows of wealth from young to old or the opposite. Cultural factors normally include religion, ethnic and racial characteristics. Finally psychological factors seem to be gaining importance in modern societies. These factors are demonstrated at the three levels: firstly, at a personal level through personal characteristics of an individual. Secondly, in relationships in small groups, especially in families and finally, at the socio-psychological level, which is defined with economic, social and political development (Bulatao and Casterline 2001).

3. RESEARCH QUESTION, DATA AND METHODOLOGY

After reviewing the theories and models of fertility, we want to find out which model is the best to explain fertility decline in Slovenia and in Croatia. Among possible explanatory variables are social, cultural, psychological and economic variables. Some economic factors, which caused the fertility declines, could be later also the consequence of the fertility decline, and thus forming a vicious circle. For example, worse macroeconomic conditions including increasing general level of unemployment may lower fertility, because of worse economic conditions for families. The fertility decline changes population age structures toward population ageing, which has implications for the economy. These implications may contribute to the lower mobility of labour, to the lower efficiency of labour, to lower aggregate activity, and to the further worsening of the macroeconomic situation.

We aim to develop our own model of fertility. We assume that factors, which influence fertility decline in Slovenia and Croatia are similar in terms of their circumstances and developments regarding fertility, mortality of children, economic contribution of children, actual and opportunity costs of raising, bearing and educating of children, transformation of families and values, and disappearances of traditional incentives for childbearing, which is reflected in postponing of marriages and pregnancy, and which is facilitated by greater access to contraception. To empirically investigate determinants of fertility, we have collected statistical data to test fertility model on the data for Slovenia. From the Statistical Office of the Republic of Slovenia (SORS), we have collected time series data for the period 1975-2005.

Fertility can be measured by different indicators like total fertility rate, crude birth rate, age specific fertility rates or by the absolute number of life births as described at the beginning of the paper. The weakness of the absolute measure of the number of life births is its dependency on the size of the population. On the other hand, total fertility rate reflects the fertility determinants only in a long run. We decided for the *crude rate of fertility* (*CFR*) as a proxy measure of fertility in our model.

To measure the first factor we collected data on *infant mortality rate (IMR)*, which is defined as the number of babies who die after the birth aged from 0 to 1 year per 1000 life births in a chosen year and in a chosen territory. We expect the correlation coefficient between the infant mortality rate (*IMR*) and the crude rate of fertility (*CRF*) to be positive.

To measure the economic contribution of children, we have collected data on agricultural area (*AA*) assuming that smaller agricultural area implies smaller proportion of rural population. Economic contribution of children is very important when helping on their families' farms. During the last three decades the proportion of rural population has been decreasing. Consequently the economic value of children for their families in this context has been lowering. We expect that the correlation between rural population proxied by the agricultural area (*AA*) and the crude rate of fertility (*CRF*) is positive.

To measure the costs of raising and educating children, we have collected data on the average starting price of the useful square meter of a habitable area, data on the average monthly salary. In order to eliminate the problem of inflation and different currencies (dinar and tolar) before and after the declaration of the Slovenian independency, we calculated a ratio between the average monthly salary and the average starting price of the useful square meter of a habitable area: the ratio is higher if costs for the habitable area are lower or if the average monthly salary is higher (*RW*). This ratio measures the number of square meters of habitable area, which can be bought by the average monthly salary. We believe that a basic economic precondition for childbearing from the couples' point of view is that they have a place to live. Beside costs related specifically to education of children, providing a child with a suitable accommodation is one of the most important costs of rising children. The correlation between the ratio of average monthly salary to the price of the habitable area (*RW*) and the crude rate of fertility (*CRF*) is expected to be positive.

Opportunity costs of childbearing and rising of children for women are proxied by the percent of unemployed woman in the total number of unemployed *(PUW)*. The lower the percentage and the number of unemployed women among all unemployed people in a given year, the more women are employed and consequently opportunity costs of childbearing and later on rising children for women are higher. We may expect that higher opportunity costs will result in a lower fertility. The lower the number of women who work (the higher the percent of unemployed women among all unemployed) the lower will be opportunity costs of childbearing. Consequently fertility may rise. Therefore, we expect positive correlation between the percent of unemployed women (*PUW*) and the crude rate of fertility (*CRF*). However, the unemployment status of women is also less likely to encourage their willingness to have children due to social problems. Therefore, it is important to understand that here we consider this part of lowering unemployment, which is determined by higher educational level of women and changes in values and not that part of unemployment, which is a result of better macroeconomic conditions, which affect both women and men. It is clear that in the case of greater overall unemployment for men and women, which is a result of worsening macroeconomic and thus also social situation, fertility will tend to decline.

Next group of factors is related to the transformation of families, disappearance of traditional incentives for childbearing and transformation of values. As a result of these changes in values of women and couples, the marriage and childbearing are postponed to the later time when women and couples are older. This delaying is mostly facilitated not by the sexual abstinence, but by the greater use of contraception, which is now much more accessible than in the past. The important causes for all these changes are changes in values, which we

measure by the proxy variable the number of divorces per 1000 marriages *(DPM)* in a chosen year. The higher the number of divorces, the greater is the transformation of families and values. There will consequently be more one parent families and personal values perceived much less traditional and conservative. We expect a negative correlation between the number of divorces per 1000 population (*DPM*) and the crude rate of fertility (*CRF*).

Using multiple regression function we have tested the model on the data collected. As a dependent variable, the total fertility as measure of level of fertility is used. This is a long run measure of fertility expressed in the average number of children born per one woman at the present level of mortality and under the assumption that all women will survive at least until the end of the reproduction period (until the end of 49th year of life). The other variables described above are taken into the regression model as explanatory variables trying to explain the variance of the fertility by the variance of the explanatory variables. The general form of a multiple linear model is:

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \ldots + \beta_p x_p + \varepsilon$$

Our individual estimates of a dependant variable, i.e., the crude rate of fertility (*CRF'*) are different from the actual values of the dependant variable (*CRF*), but are on average the same as the actual values (*E(CRF')=CRF*). Therefore, a random variable or error terms (ε) is distributed normally with a mean value of zero and a standard deviation, which is equal for all values of x_i, and hence we may rewrite the model as:

$$E(y) = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \ldots + \beta_p x_p$$

We are working with a sample data, and thus the final form of a model is:

$$\hat{y} = b_0 + b_1 x_1 + b_2 x_2 + b_3 x_3 + \ldots + b_k x_k \, ,$$

whereas in our specific case, this is:

$$CRF = b_0 + b_1 IMR + b_2 AA + b_3 RW + b_4 PUW + b_5 DPM$$

This fertility model is empirically tested in the regression framework employing ordinary least square (OLS) method.

4. THE FERTILITY MODEL

The fertility model, which we have developed, tries to explain the variations of fertility, which is measured by the crude rate of fertility, by the variations of the five independent explanatory variables. These explanatory variables are: the infant mortality rate (*IMR*), agricultural area (*AA*), the ratio of average monthly salary in real terms (*RW*), the percent of unemployed woman in the total number of unemployed (*PUW*), and the number of divorces per 1000 marriages (*DPM*). The each explanatory variables stand for the corresponding fertility factor: mortality of children, economic contribution of children, costs of raising and educating children, opportunity costs of bearing and rising children, and transformation of families. These explanatory variables together explain around 98% of variations in fertility (adjusted $R^2=0.98$).

The signs of the regression coefficients are in accordance with our theoretical expectations. The regression coefficient b_1 is positive, meaning that the decreasing values of infant mortality by years correlates with the decreasing values of fertility. The regression coefficient b_2 is positive as well, meaning that the decreasing significance of agricultural values by years correlates with the decreasing fertility. The regression coefficient b_3 is also positive, meaning that the real monthly wages expressed in the number of m^2 of habitable area one can buy with the average monthly salary positively correlates with fertility. The coefficient b_4 is positive too, meaning that the decreasing percent of unemployed women in the whole number of unemployed by years correlates with the decreasing fertility. Finally, the regression coefficient b_5 is negative, meaning that the increasing percent of divorces per 1000 marriages by years reduces the fertility. All the partial regression coefficients, except the regression constant and the regression coefficient b_3, are statistically significant. The level of significance for the regression constant and for the b_3 is at around 5% for the two-tailed t-test. The one-tailed t-test is more appropriate, and thus we divide these two significance levels by two to obtain the sufficiently low risk levels when rejecting the null hypothesis that a chosen variable has no influence on the crude rate of fertility. Namely, we expect the regression coefficients b_0 and b_3 to be not only different from zero, but also to be positive. This is why one-tailed t-test is justified.

F-test shows that the fertility model as a whole is a good explanation of the fertility variations. Table 1 presents the estimated fertility regression. The form of the regression function describing the relation between the fertility and the five fertility determinants, which is the result of the regression analysis, is the following:

$$CRF = 2.87 + 0.29*IMR + 2.83E\text{-}06*AA + 3.37*RW + 0.095*PUW + -0.0095*DPM$$

Table 1. Summary of the regression analysis results.

Variable	Coefficients	T stat	Two-tailed p-value	One-tailed p-value
Regr.constant	2.865	2.003	0.0577	0.0288

5. CONCLUSIONS

Similar to many other developed countries, the rate of fertility in Croatia and Slovenia has been persistently declining during the last decades. It is also projected to decline further for the next 20 years. As a result the populations of Croatia and Slovenia are becoming older and older, which has many negative implications for labour market and the economy as a whole. Looking closer at fertility determinants, we found out that there are many different theories trying to explain variations in fertility. We succeeded to explain variations in fertility in Slovenia during the last decades by the following explanatory variables: mortality of children, economic contribution of children, costs of raising and educating of children,

opportunity costs of bearing and rising of children, and transformation of families and values. We assume that factors influencing fertility decline in Slovenia are in some ways similar to those in Croatia in terms of their circumstances and developments.

The mortality of babies has been decreasing and is very low now. The direct economic value of children for their families is decreasing and hence the need for them is lower. The real costs of having a family are not decreasing. The prices of housing and many other family related expenses are even increasing. On another hand, women are more educated and more active in the labour market. These changes imply the increase of opportunity costs of childbearing and rising of children, measured in the forgone earnings and careers. Finally, the increasingly important reason why couples choose to have fewer children is the change of personal values and the transformation of families. The society is more consumption orientated understanding a child more as consumption alternative. When deciding between having a new car and having another baby they decide more according to the short run criteria. This is true especially if they do not have any deeper personal convictions about the value of a child. Since these convictions are in decline, marriage and pregnancy is postponed.

The analysis of the fertility reveals that single, more educated women, women with more demanding jobs, women who live in bigger towns and women who are not religious still have fewer children than married women, lower educated women, women with less demanding jobs, women living outside large towns and women who are religious. Most of the factors included in our fertility model are expected to keep on developing in the same direction. We may conclude that fertility decline is a consequence of a rational process, which is based on the conclusion of each individual that in a short run it makes sense to decide for fewer children for economic, social and psychological benefits they may have in a short run. Where are the limits and what will bee the final consequences of such a process, and what do we need to do as a society in order to become more long run orientated, remains an open question.

Key words: *ethics, compensation management, gender pay gap, executive compensation, Croatian enterprise*

Abstract

This paper deals with several ethical considerations in the area of compensation management in Croatian enterprises. It is based on a survey performed in Croatia in the first three months of 2005. The survey sample includes 350 Croatian enterprises whose top managers were distributed questionnaires. Questionnaire return rate was 18% and included different branches of the economy. Extensive research has showed the following: variable compensation in Croatian enterprises is in most cases based on objective performance indicators. Gender pay gap in Croatia is not as widespread as it is in developed western economies. In Croatia it amounts to 10,5% compared to the EU25 where it is estimated to be 15%. Comparisons of the amounts of executive pay to the average employee pay can not be categorized as unethical, as the ratio is from 1:7 to 1:10 which is acceptable to the theoretical standards.

1.   INTRODUCTION

Considering that people differ in incomes, wages and terms of employment one can say that wage discrimination is undisputable and that there is no ethics in compensation. On the other hand, can all wage differences be regarded as wage discrimination? As far as in 1975 a number of European Directives[1] were introduced to support the principle of equal pay to work of equal value, guarantee the equal treatment in the workplace (i.e. access to employment, vocational training, promotion and working conditions) and provide for equal treatment of women and men with respect to both statutory social security and occupational social security (Rice, 1999). These and later introduced Directives[2] apply to the EU countries whereas in

---

[1] Council Directive 75/117/EEC of 10 Feb 1975 on the application of the principle of equal pay for men and women, http://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:31975L0117:EN:HTML
[2] http://ec.europa.eu/employment_social/gender_equality/legislation/legalacts_en.html#directives

Croatia this area has been regulated through Employment Law.[3] The principles applied in Croatia seem derived from the principles applied in the EU. But the real question is whether these principles work in practice and disable the phenomenon of wage discrimination.

When discussing about ethical issues in compensation the main question is: what is actually unethical behavior in compensation? Is it unethical to pay different amounts to employees that perform the same task? Or is it unethical to pay employees the same amounts if they perform same tasks but one of them with much more effort and better performance than the other? Fairness and justice in compensation is an often used, but fairly vague concept than needs to be defined first. Here we must understand the meaning of the term economic or wage discrimination. Economic discrimination is defined as when otherwise identical workers receive different pay doing the same job or are given different chances of employment or promotion. It is the presence of different pay for workers of the same ability but who are in different groups (Grybaite, 2006). Economic discrimination should be avoided whenever possible due to its poor influence on employee motivation and performance.

Business ethics is frequently discerned at three different levels. A macro level that focuses on the political system, a meso level that concentrates on the organization as such, and a micro level that elaborates on individuals inside organizations (Steinmann and Löhr, 1996). For the purpose of this paper we will consider unethical behavior in compensation as the lack of internal equity in compensation - where internally equitable compensation pays people in proportion to the relative value of their job (Berger & Berger, 1999:41). Furthermore, we will consider unethical behavior in compensation when jobs of the same relative value bring different salaries, based on other reasons than the employee performance. Besides the amount of base salary some other issues in compensation very often get criticized as examples of unethical behavior. One of these is executive compensation. Ethical aspects in executive compensation that we consider in this paper are the basis for calculating executive compensation and the comparison of the amounts of executive pay to the average employee pay. Another regular discussion in compensation includes gender pay differences. As a part of this paper we will explore the situation in Croatia both regarding executive compensation and gender pay gaps.

In most general terms, compensation is a reward for employees' effort. It should motivate employees to take higher effort and tighten up both the interests and objectives of employees and enterprises. Unfortunately, with the higher element of discretion in a compensation system, the possibilities and risk of unethical behavior increase. There are numerous examples of equal work that is differently rewarded in spite of strong efforts for eliminating economic discrimination. A great deal of such discrimination is a result of the characteristics of a compensation system in the enterprise. The main interest of this paper consists of exploration of described ethical issues in compensation management of Croatian enterprises. This area will be explored and tested through the following hypotheses:

H1: Variable compensation in Croatian enterprises is in most cases based on objective performance indicators e.g. performance appraisal and piecework pay.

H2: In Croatian enterprises the problem of gender pay gap is not as widespread as in developed western economies.

H3: In Croatian enterprises it is possible to recognize unethical behavior when comparing amounts of executive pay to the average employee pay.

2. METHODOLOGY OF RESEARCH

The study that is the basis for this paper was conducted during the first three months of 2005 in Croatia. The sample covered 350 Croatian enterprises in all branches of the economy. The sample covers manufacturing, service and trading companies. It was attempted to cover small, medium and large companies proportionally. The study questionnaire consisted of basic information about the firm and 66 questions in the areas of competitive structure, strategy, organizational structure, technology, compensation management and environmental management.

The questionnaire was distributed to top managers, which is logical in view of the nature of the study. Within 70 days, 63 questionnaires were received (questionnaire return rate: 18%), which is satisfactory for the purpose of our study. We stress that all the key major Croatian companies returned their questionnaires. It is interesting to note that the companies which returned questionnaires employed 52667 people in 2004, gained total revenue of 2.984.036.147 US$ and made total profits of 215.894.912 US$. Questionnaires were received from 49 manufacturing and 14 non-manufacturing companies. We consider the study sample representative considering that the companies questioned employ more than 4,1% of all employees in Croatia and that the ratio between the revenues of manufacturing and non-manufacturing companies in the sample is nearly equal to that in the Croatian economy (42,5% non manufacturing: 57,5% manufacturing).

For the purposes of this study we identified three groups of companies according to number of employees. The first group, which was labeled "small companies", consists of companies which have between 15 and 100 employees; the second group, companies with between 100 and 500 employees, was labeled "medium companies"; and the third group, companies with more than 500 employees, was labeled "large companies". The division is of a conditional character and although there was no weighting by total revenue or type of activity, it seems to clearly show the present situation in the Croatian economy.

Table 1: Independent characteristics of examined enterprises

Independent characteristic of enterprise	Distribution in the sample		
Size of enterprise	**Small**	**Medium**	**Large**
	26,4%	37,7%	37,7%
Ownership majority	**State ownership**	**Private ownership**	**Foreign ownership**
	18,03%	59,02%	22,95%
Industry	**Manufacturing**	**Non manufacturing**	
	57,5%	42,5%	

Besides the data from our research we use on-line data provided by Croatian Bureau of Statistics, Eurostat, World Bank and USAID.

3.   THE BASIS FOR VARIABLE COMPENSATION

In today's competitive world only a few disagree that individuals who contribute more to achieving organizational goals should receive greater rewards. The change in the wage setting mechanism, from administrative to market-based has led to a sharp increase in wage dispersion. More productive and expanding firms in general tend to pay higher wages, especially to workers whose skills are in high demand. The process by which monetary rates are attached to each job is job pricing. The process should be taken carefully to establish consistency and equity throughout the pay structure. Two basic issues must be determined: (1) how to measure the worth of jobs and thus assign them in a place in the hierarchy and (2) what is an appropriate pay gap between different levels in the hierarchy.

Salary surveys such as salary survey performed by Hay group consistently demonstrate considerable variability in wages for the same job in the same national labor market.[4] Salaries can vary by as much as 100% meaning that there are people in the marketplace that are performing the same or similar jobs but who earn as twice as much as other people (Turnasella, 1999). However, due to the fact that enterprises differ in their internal structure and organization and thus in human resources effectiveness, oscillations in pay for the same occupation in different enterprises can not be regarded as economic discrimination. A different issue is internal pay inequality that exists within companies.

Principle of equity in compensation is divided into internal and external equity. External equity focuses on external labor market and aims at paying everyone in organization around the market rate for similar jobs. An organization has four choices relative to its compensation levels: (1) pay what the market is paying, follow, (2) pay in excess of what the market is paying, lead, (3) pay less than the market is paying, lag or (4) some combination to follow, lead and lag (Caruth & Handlogten, 2001). External equity is not something that would be a strong source for the perception of lack of ethics in compensation as internal one (Thorpe & Homan, 2000:25). Thorpe and Homan explain that employees will understand that one employer is able to pay higher wages than another, and in such cases it is possible that employees will seek employment in higher-paying organizations. However, when pay is associated with the perception of unfair distribution within the enterprise it will result in low confidence in the compensation system. In practice it is much harder to achieve internal equity than external one. Negative consequences of inequality are absence, low effort, hostility and dissatisfaction with the organization. We consider that internal inequity is an effect of unethical behavior in compensation.

Internal equity implies that jobs requiring greater amounts of skill, effort and responsibility are compensated at higher rates of pay than jobs requiring lesser amounts. In other words, internal equity is just fairness in rewarding jobs based on the degree of difficulty entailed in performing these jobs. Internal equity recognizes as fairly as possible the differences inherent in jobs and pays them accordingly. Likewise, an enterprise needs to implement a formal compensation program that will recognize the difference among jobs and reflect these differences in pay. There is also the matter of perceived equity – fairness of the compensation system as seen through eyes of employees. In the very core of internal equity is variable compensation.

[4] Hay Group is a global management consultancy, especially active in the area of compensation management. It has offices in 47 countries. Office in charge for Croatia is located in Budapest. www.haygroup.com

Variable pay rewards employees according to partial or complete attainment of predetermined work objectives. It is defined as a compensation that fluctuates according to employee's achievement of some standard based on a preestablished formula, individual or group goals or company earnings (Martocchio, 2006:136). Lawler (2000) distinguishes among two types of variable compensation: incentive pay (or piecework pay) and merit pay. *Incentive pay* involves paying employees directly for the amount of work they produce. This approach is associated with factory work that can be measured. This system is difficult to design, maintain and mange and it carries a strong bureaucratic weight. *Merit pay* can be applied for most employees in an organization. Pay is a result of the subjective performance rating by direct superior or a formal process of performance appraisal. Evidence exist that merit pay is a poor motivator for performance if the performance measures are somewhat unclear and the rewards for performance are relatively small (Lawler, 2000). However a strong advantage of merit pay is the relative simplicity in its application when compared to other compensation systems.

Variable compensation is based on pay for performance principle. Therefore a mechanism must be used to measure and rate performance for all employees whose pay will depend upon performance. In most cases the mechanism used to measure and rate performance is performance appraisal. Performance appraisal is the formal process, normally conducted by means of completing an instrument that identifies and documents a jobholder's contribution and workplace behavior (Henderson, 2006:325). It is already clear that the discussion about ethical issues in compensation depends greatly on fair judgment of performance. Some of the obstacles associated with performance appraisal are: (1) it is subjective, (2) a single rating is a superficial and arbitrary judgment, (3) the performance review is dominated by the necessity to perform a rating and to development, (4) it is extremely difficult to rate qualitative aspects of performance (Armstrong & Stephens, 2005).

What most organizations wish to emphasize through variable pay is that an employee will receive a pay increase only if it is deserved by work. The process of performance appraisal here has the most important role as it must indicate which employees have showed a high effort to the accomplishment of the enterprise's goals. Martocchio (2006) lists four points of interest to assure nondiscriminatory performance appraisal: (1) conduct job analyses to ascertain characteristics necessary for successful job performance, (2) job characteristics must be included in the rating instrument, (3) supervisors must be trained to use the rating instrument properly, (4) review of ratings by upper level personnel helps to make performance appraisal process more accurate and effective.

Pay for performance scheme can result in a substantial difference in pay for the people performing the same job within the company. When companies' merit increases do not clearly reflect differences in actual job performances top performers may become frustrated and reduce their level of performance. In some cases this problem can be solved through alternative rewards such as benefits but it will surely bring disappointment to employees. However, there are some different views to the problem of variable compensation. Turnascella (1999) argues that internal pay inequality can be traced back to the hiring process and the salary negotiations between the organization and the employee.

4.   PAY GAPS

Surely much of the pay differential can be associated to factors such as occupational choice, union membership and different industry characteristics that can not be categorized as economic discrimination. In spite of the legislative effort and social awareness some of the most emphasized discriminatory pay gaps are the gender gap and the gap resulting from the comparison of the amounts of executive compensation to blue collar employee pay. Practice also recognizes age pay gaps, minorities pay gaps, pay gaps for people with disabilities, pregnancy discrimination etc.

The gap between male and female earnings, or gender pay gap, is given special attention. In industries in which female dominate the workforce, meaning that in excess of 70% of all employees are female, wage rates are usually lower than in those cases in which males are the dominant workers (Henderson, 2006:32). It is encouraging that starting from 1980s this gap is decreasing. For example, it decreased in the USA from traditionally some 60% to 79,7% in 2003.[5]

It is common sense that unskilled workers get less paid than skilled workers. Technological progress and structural shifts, such as that from the manufacturing sector to the services sector, raised relative demand for, and thus wages, of white-collar skilled workers. At the same time, the process implied deterioration in the relative wages of less-skilled, blue-collar workers employed in declining manufacturing industries. The changes in the structure of the economy, and thus changes in relative demand for different types of labor, have given rise to various wage premiums to worker and firm characteristics (such as education, skills, occupation, industry, and location) and contributed to the increase in wage inequality. For example, a university-educated worker in Poland currently earns (on average) 70 percent more than a worker with basic vocational training does. Under central planning, the differential was merely 20 percent (World Bank, 2005).

However, the question is what should be the ratio of pay for two employees? A typical example for this issue is the pay of top executives. The ethics of remuneration especially has been a matter of keen interest in recent years as a result of the controversy over executive pay. Concern has been expressed over the expanding differentials which executives enjoy over other employees and attention has been directed both towards executive pay systems and the decision-making processes through which such systems are chosen. Enterprises use variable compensation to align interests of shareholders and management. Executive pay increased between two and three times from the early 1990s until today (McCall, 2005). Still, the gap among CEO pay and employee pay continues to grow, despite criticisms from the public, shareholders and the media (Pratt, 1996). There are five elements of executive compensation: salary, benefits, short term incentives (mostly cash or stock), long term incentives (mostly stock options) and perquisites (Ellig, 2003). The biggest contributing factor to the growth of the pay gap is the use of stock options in executive compensation packages, or the variable pay component of the compensation package. Stock based rewards are mostly designed to hold on to top managers and to encourage them to strive for long term results, but CEO compensation dips even though corporate profits decline. In fact, many would agree that the way to narrow the pay gap is not necessarily through cutting pay at the top but by extending incentive opportunities down through the organization. There is the possibility also to link

---

[5] Employment and Earnings, Bureau of Labor Statistics, January 2004 according to Henderson, 2006, pp.33

long term compensation with the market measures of firm performance (Singh & Agarwal, 2003).

Recently, the public has started to question the wisdom of excessive amounts of CEO pay and even argument that stock option plans have a causal role in financial and accounting scandals that have hit US megacorporations as options have value only when stock price rises (McCall 2005:244). The main issue explored has been whether executives are overpaid or their compensation reflects rewards for their leadership and performance. We argue that from the pure moral perspective it is not ethical to pay CEOs amounts that exceed average employee pay for a few tens times. McCall (2005) suggests two moral criteria for the assessment of CEO pay: net social welfare and fairness/justice. On the criterion of net welfare the consequences of high executive compensation are negative. It affects employee morale, social cohesion and even causes shareholder dilution. Moreover, the size and the nature of compensation package create pervasive incentives to focus on short term profit maximization. On the grounds of justice and fairness executive compensation omits the relative level of contribution and risk taken by the employees. Is really the contribution of an employee 20, 50 or 100 times minor than executive's?

Additional ethical consideration that we did not explore in detail this paper, but that surely exists is the problem of determining compensation practices for top executives. The problem is *who* produces these compensation practices. Executive compensation is often set either directly by BoD or by use of consultants. Again, the consultants are often recommended by the company's management team, and management team needs to approve the amount recommended (McCall 2005:249). Therefore, all refers that executives have a strong influence on determining their own pay levels.

5.   DATA ANALYSIS AND DISCUSSION

Ethical issues in compensation management in Croatian enterprises will be considered through several empirical tests. An important cornerstone for compensation is formulated compensation strategy in an enterprise. Enterprises can have a formulated compensation strategy or completely ignore its importance and thus pay their employees without any formal basis. If an enterprise does not have formal compensation strategy it is difficult to discuss about ethic in compensation as there are no set rules and procedures to follow in compensation. It means that it will be possible to recognize the existence of unethical behavior, but it will not be possible to find arguments to support the thesis that the system is unethical as there are no rules that define how should an adequate compensation system look like. Table 2 presents the empirical results gained from the exploration of compensation strategy in Croatian enterprises. It can be seen that more than 85% of Croatian enterprises have directly or indirectly (through HRM strategy) defined compensation strategy. Thus it can be expected that unethical compensation is hardly to be an aim for any of these enterprises that they would want to achieve with compensation system. Actually, we believe that our paper can help to test the final outcome and results obtained by implementing different formally existing compensation strategies. We believe that non-existence of a compensation strategy could be a strong justification for occurring ethically dubious compensation issues. As could have been expected with the increase of the size of enterprise the percentage of enterprises that have a formulated compensation strategy also increases (31% of small, 32% of medium, 59% of large enterprises). Informal compensation system is rarely perceived as

fair. It is usually seen as biased and arbitrary because employees may feel that there is no logic attached to it. A formal compensation program, relying on job analyses, systems and logic is more readily perceived by employees as fair and equitable. Formalization of compensation programs increases the likehood of perceived equity on the part of the employees.

Table 2: The existence of the compensation strategy in enterprise

Does the company have a formulated compensation strategy?	All enterprises	Small enterprises	Medium enterprises	Large enterprises
YES, and it represents an essential part of the HRM strategy, and as such of the strategic plans of the company	41,27%	31,25%	32,00%	59,09%
It is partially included in the HRM strategy, but not in detail	44,44%	50,00%	52,00%	31,82%
NO	14,29%	18,75%	16,00%	9,09%
Total	100,00%	100,00%	100,00%	100,00%

In traditional pay plans employees received compensation based on fixed hourly pay rate or monthly (annual) salary. These employees earned raises according to their length of service in the organization or according to supervisors' subjective appraisals of employee's job performance. Today enterprises use incentive pay based on employee performance to reward individual employees (Martocchio, 2006: 137-138). Here we have two possibilities: set measurable merit performance standards that apply to each individual or the second possibility is to use incentive compensation system that uses more objective criteria such as different indicators to determine variable compensation. Under traditional pay plans there were limited possibilities for unethical behaviors. Therefore in further exploration of compensation system in Croatian enterprises we determined whether enterprises still use traditional compensation systems, or they use variable compensation. The results are shown in table 3.

Table 3: The base for determining individual variable compensation

	All enterprises	Small enterprises	Medium enterprises	Large enterprises
No variable compensation (salary)	3,61%	5,26%	3,03%	3,33%
Supervisors' subjective rating	33,73%	31,58%	42,42%	23,33%
Incentive pay or piecework pay standards	21,69%	21,05%	18,18%	26,67%
Performance appraisal	34,94%	26,32%	30,30%	46,67%
Else	6,02%	15,79%	6,06%	0,00%
Total	100,00%	100,00%	100,00%	100,00%

Table 3 shows that Croatian enterprises mostly use variable compensation. Traditional compensation in its basic form that has no variable part is used in only 3,6 % of Croatian enterprises. This conclusion is reasonable as such kind of compensation system has no extra motivation potential except for the amount of base pay. A modification of pure annual salary is when supervisors independently distribute pay increases. Subjective rating by the supervisor is used in 33,7% of Croatian enterprises. Fortunately, this does not open much room for derogation of internal equity in compensation as the amounts that managers can distribute are usually in the range of 2-6% (Martocchio, 2006). As expected, this method is

least used in large enterprises (23,3%), although we find the percentage of large enterprises that use this method quite high taking in account subjective character of this method. Even higher percentage of medium sized enterprises use subjective manager's rating (42,4%). Truly variable compensation is the compensation that is based on achieving incentive standards or compensation based on performance appraisal. In comparing these two, performance appraisal is a technique that can be categorized as more subjective in nature as there are no articulated objective standards that need to be achieved. As much as almost 35% of Croatian enterprises use performance appraisal. The rate of use for performance appraisal increases as the enterprise size increases (it is used by 26,3% of small enterprises, 30,3% of medium sized enterprises and 46,7% of large sized enterprises). Performance appraisal, if not used properly, can be a strong source of unethical incentives in compensation. Therefore the next examination that we preformed involved the attitude of survey respondents to the performance appraisal. The respondents were asked to rate whether they believed that performance appraisal was suitable method for determining the variable part of the salary.

Although measures used by performance appraisals are not always quantifiable table 4 shows that Croatian enterprises consider performance appraisal to be a good method for determining variable part of the salary - if applied properly (68,8%). Other respondents believe that it is better than the other methods such as supervisors' subjective rating (20,3%). Only 7,9% of Croatian enterprises consider that it is not good method for determining variable part of the salary because it does not assure objective determining of performance. When we include the size of enterprise in the analysis an interesting observation can be made. Table 4 shows that small enterprises have the best attitude towards performance appraisal as 75% of small enterprises consider it to be a good method for determining variable part of the salary (compared to 72% of medium enterprises and only 56,5% of large enterprises). Here it may seem that performance appraisal is somewhat similar to the subjective rating by the manager. Although both of there measure are based on evaluation performed by the superior, performance appraisal is a much formal procedure that is based on model prepared separately for each job. Subjective rating by the manager allows for a higher degree of flexibility in rating.

Table 4: The attitude of survey respondents to performance appraisal

	All enterprises	Small enterprises	Medium enterprises	Large enterprises
It is a good method for determining variable part of the salary if applied properly	68,75%	75,00%	72,00%	56,52%
It is not good method for determining variable part of the salary because it does not assure objective performance determining	7,81%	12,50%	4,00%	8,70%
It is better method for determining variable part of the salary than supervisors' subjective rating	20,31%	12,50%	20,00%	30,43%
Other	3,13%	0,00%	4,00%	4,35%
Total	**100,00%**	**100,00%**	**100,00%**	**100,00%**

Tables 3 and 4 show that enterprises which apply variable compensation lay it on the basis of pay for performance scheme. Awarding pay increases on factors other than job performance could lead to discrimination of some employee groups. One such violation could include gender pay gaps or the situation where employee sex influences its compensation more than performance. Wage inequality is presently high in all transition countries including Croatia.

Table 5: Average monthly net earnings of persons in legal entities by industry, 2004 average

Legal entity	Total	Women	Men	Women's salaries as percentage of men's
	In kuna

Source: Report: *Women and Men in Croatia 2006*, issued by Croatian Bureau of Statistics, www.dzs.hr

The gender pay differential has declined in many countries in the Region and is relatively small**.** On average, women earn some 20 percent less than men in comparable jobs, which is modest by international standards (World Bank, 2005).

Traditionally women's work is generally undervalued: less value is often placed on social skills demonstrated by women than on physical strength demonstrated by men. Women do not have same opportunities for work. A woman who has recently been hired by a company may have a lower wage than a man who started work at the same time and for the same employer. This can lead to a lifetime of lower wages. Women do not have same chance of promotion which in turn affects wage earned. Surely that discrimination in rates of pay between men and women is directly or indirectly banned in national legislations but it does not imply that it does not exist. For example, a minimum wage can also be a preventative weapon in the fight against pay inequalities. The data about net earnings for Croatia is presented in table 5. Data on wage gap should be available at the company level in order for pay inequalities to be discovered.

Table 5 shows that on average in 2004 women in Croatia earned 10,5% less than men. The only legal entity in which women earned more than men is construction. This could led us to conclusion that women earn more in construction as they do not perform manual work (due to physical restraints) but they occupy engineer positions.
Figure 1: Employed persons by industry, 2001 census

Source: Report: *Women and Men in Croatia 2006*, issued by Croatian Bureau of Statistics, www.dzs.hr, pp. 50

Figure 1 shows that women in construction account for only 9,4% of all employees. Surely to get the real picture about gender pay gaps we should compare data for the same occupation and employees with the same education. However as most data for other countries does not include this much details it gives us possibility to compare data from different countries. The highest gender pay gap in Croatian enterprises is in the area of manufacturing (women earn 78,0% of average men pay) where men account for 60,8% of all employees. The next highest gender pay gap is in financial intermediation (79,7%) where men account for 30% of all employees. This shows that there is no relation among the percentage of men or women in an industry and the gender pay gap in.

Figure 1 shows that there are significant differences in the ratio of women employees in different industries. It is possible to conclude that there are some typical women occupations in Croatia, and some typically men. What should be explored here is whether this is the result of individual's occupational choice or the result of different opportunities for men and women.

Table 6: Gender pay gap in 2004 in Europe 25

e-estimated, p-provisional, +-gender pay gap higher than in Croatia, - - gender pay gap lower than in Croatia
Source: Eurostat: A statistical view of the life of women and men in the EU25, news release 29/2006, March 2006,
http://epp.eurostat.ec.europa.eu/pls/portal/docs/PAGE/PGP_PRD_CAT_PREREL/PGE_CAT_PREREL_YEAR_2006/PGE_CAT_PREREL_YEAR_2006_MONTH_03/3-06032006-EN-BP1.PDF

Tables 4 and 5 show that gender pay gap in Croatia in 2004 was not so high as in the European Union. Only 7 countries from the EU25 have smaller gender pay gap than Croatia (Belgium, Greece, Italy, Malta, Portugal, Poland, Slovenia). If we compare gender pay gap in Croatia to the EU25 as a whole, it can be seen that again gender pay gap in Croatia is smaller for more than 5%. An interesting data is the gender pay gap in Slovenia (9%) that is comparable to the pay gap in Croatia (10,5%), which is lower than for the Region (World Bank 2005). From the point of view that Croatia and Slovenia had a common economic and political history up to the beginning of 1990s it is encouraging that this gap did not increase in any of these countries to the level of the EU average.

The second issue when discussing about pay discrimination is the executive pay. The press generally suggests that executives are overpaid and that their pay is not related to the performance of the enterprise as it is the case for other employees in the enterprise. Executive pay is subject to the same forces that drive compensation for other organizational employees: the labor market, job responsibilities, and required skills. But in practice there are other issues such as: the spread of CEO pay and that of the next lower management level, the personal influences a CEO can exert on his on her own level of compensation, organizational performance attributable to actions of the CEO and the attitude of the organization's board of directors. In fact Caruth & Handlogten (2001) suggest that executive compensation is subject to market forces on the one hand and may be the result of political or manipulative factors on the other hand.

The ethical consideration that we see here is whether executive compensation is reasonable in its amounts? Martocchio (2006) suggests three considerations that need to be considered: abilities to attract and retain top executives (high compensation of executives is necessary to retain top executives), income disparities between executives and other employees (income disparity between executives and nonexecutive employees is increasing) and layoffs of other employees (layoffs of workers but not executives). Executive compensation usually has several components agreed through management contracts: base salary, short-term incentives, long term incentives and indirect monetary compensation.

Table 6: The use of executive compensation contracts in Croatian enterprises

	All enterprises	Small enterprises	Medium enterprises	Large enterprises
Only for top managers	38,71%	37,50%	52,00%	23,81%
Only top and middle managers	37,10%	12,50%	32,00%	61,90%
They are not used	16,13%	37,50%	12,00%	4,76%
Executive compensation is determined through some other combination	8,06%	12,50%	4,00%	9,52%
Total	**100,00%**	**100,00%**	**100,00%**	**100,00%**

Table 6 shows that the use of tailored executive compensation contracts is quite often in Croatia. Some 39% of examined enterprises use it only for top managers, while additional 31% use it for middle managers too. Only 16,1% of examined enterprises do not use any special contracts in executive compensation. As could have been expected the largest percentage of enterprises that do not use executive contracts is among small enterprises (37,5%). At the same time in large enterprises only 4,8% of enterprises do not use at all executive compensation contracts. The data indicates that the possibilities for unethical behavior exist. Unfortunately, Croatian Bureau of Statistics still does not provide official statistics about the comparison of the executive compensation to the compensation of different occupations in Croatia. For example, in the USA the USA of Bureau Statistics presented the data that showed that in 2004 the typical annual earnings for the lowest-paid occupation (child care workers) amounted to mere 0,25% of the average annual CEO salary and bonus, while the ration of highest paid occupation (airline pilots) was 1,88% to the average annual CEO salary and bonus (Martocchio, 2006:440). Available data are only from partial surveys. For example Economic institute Zagreb conducted the research among joint stock companies with the members of the management and supervisory boards.[6] Based on the data from the survey and the data on the minimum and maximum average monthly salaries in Croatia they suggested that the range of average pay to the executive pay in joint stock companies is among 1:7 to 1:10. Green & Tenneriello argue that the top-bottom ratio in compensation should be 15 to 1 in small organizations and 25 to 1 in large enterprises.[7] The same research also showed that the criteria for management compensation is in most cases agreed through tailored executive contracts which is also according to the results of our survey. The research showed that the ratio of fixed and variable part of the executive pay is 89,49% to 10,51%.

---

[6] Questionnaires were returned by 191 members of 63 companies. That accounted for 26.9% of all public joint stock companies and 11.6% of the total number of members of the management and supervisory boards of the surveyed companies, http://www.vse.hr/edukacija/Korporacijsko_upravljanje.pdf

[7] Henderson (2006:74)

Table 7: Development of use in components of executive compensation in the period 2001-2003

Component of executive compensation	Percentage	
	YES	NO
Stocks or options	8,8%	91,2%
Increased variable part of the salary	3,7	76,3%
Profitsharing	15,5%	84,5%
Clear criteria exist to determine the relationship among performance of the enterprise and the variable part of executive compensation	33%	67%

Adapted from the USAID, Survey of Corporate Governance,
http://www.vse.hr/edukacija/Korporacijsko_upravljanje.pdf

Table 7 shows that in the period 2001-2003 the major concern in executive compensation was to establish a relationship among an enterprise's performance and the variable part of executive compensation. At the same time distribution of stocks and options was used in only 8,8% of Croatian enterprises that indicates that executive compensation in Croatian enterprises are still underdeveloped. Comparably, in the USA not only that most enterprises use stock options but options as a percentage of executive pay increased from 27% to 60% through the 1990s (McCall 2005:243).

Table 8: Components of executive compensation

	All enterprises count	All enterprises %
No special compensation	19	28,79%
Short term bonuses	34	51,52%
Long term bonuses	0	0,00%
Options	7	10,61%
Benefits	6	9,09%
Other	0	0,00%

Table 8 is based on our research performed at the beginning of 2005. It shows that 29% of examined enterprises had no special incentives for executives. In our opinion this data is the result of compensation practice in state own enterprises that use collective agreements that regulate salary issues for all employees. The most used incentive in the case of executive compensation is short term bonus. The trend to use short term bonuses as the variable part of the salary was among the most important changes that occurred in the history of executive compensation. Because salary increase budgets remained well below the historical averages, increased emphasis is being put on short-term variable pay programs for all levels of employees. More than half (51,5%) of examined companies in Croatia use this method for executive compensation. Options are used in 10,6% of examined enterprises which is a small amount compared to the global trends. Henderson (2006) notes that studies performed back in 1990s in USA found that almost all enterprises use short term incentives for managers.[8] Same studies found that the median CEO bonus was approximately 50% of the base salary. Lawler (2000) suggests that pay for performance in case of managers should have multiple form of pay for performance. Some of their rewards should be tied to corporate performance, some to business unit performance and to individual performance.

Although, it seems that the ratio among executive pay and average employee high is not so high in May 2006 the press revealed some of the highest executive salaries in Croatia in the

---

[8] For example: study by The Conference Board (1990) or study by the Hay group (1985)

first three months of 2006.[9] They state that the highest pay is 207500,00 kn which is some 46 times higher than the average salary in Croatia. Furthermore, if we take first 20 highest salaries according to this source, the ratio decreases to some 17 times. This shows that generally speaking, the amount of executive pay to the average employee pay is not so high, but if we take individual examples it can be seen high oscillations.

6. CONCLUSIONS

When jobs are essentially the same, their remuneration should be the same. Or, in other terms equal pay for work of equal value would mean that the compensation system is ethical. Of course, to determine whether the work performed is of equal value, a comparison of jobs is required. This involves assessing the nature of tasks and demands made upon workers in carrying them out, such as skill, effort, responsibility, etc. But this is just assuring a good base for a compensation system and a fair base pay. The second important part of any compensation system is to asses the work of an employee and based on this determine the variable part of his pay. People tend to identify as unfair things that they merely do not like. However, there are a number of considerations that need to be examined to support actual unfairness and unethical behavior in compensation. Distributional fairness necessarily involves assessment of contribution and effort that an employee has shown towards the accomplishment of company's goals. In this paper we have empirically tested some ethical issues in compensation in Croatian enterprises.

The first thing that we tested is the existence of compensation strategies in Croatian enterprises. The results of our survey have shown that only 14,3% of all enterprises from our survey sample do not have a formulated compensation strategy. In our opinion, the existence of a compensation strategy in the examined enterprise leaves very little space for subjectivity in determining rewards as compensation practice in these enterprises supports human resources' or competitive strategies. This conclusion leads us to the first hypothesis of our paper: variable compensation in Croatian enterprises is in most cases based on objective performance indicators e.g. performance appraisal and piecework related pay. Our survey has shown that most enterprises from the survey sample do have variable compensation (96,4%), although the basis for determining variable compensation differs among enterprises. There are actually two most often used basis for determining variable compensation: supervisor's subjective rating (used in 33,7% of examined enterprises) and performance appraisal (34,9% of examined enterprises). Piecework pay standards are used in 21,7% of examined enterprises. Although supervisor's subjective rating and performance appraisal are in some instances similar, performance appraisal is a more formalized process, and thus more objective. Again, comparing supervisor's subjective rating and piecework pay, can be seen that piecework related pay is much more objective as it is also based on formal standards that need to be achieved. Based on these findings we consider that variable compensation in Croatian enterprises is in most cases based on objective indicators (performance appraisal used in 34,9% of enterprises + 21,7% enterprises using piecework related pay sum up to 56,6% of enterprises that use objective performance indicators for determining variable compensation). Therefore we consider the first hypothesis of this paper accepted. Here we did an additional examination of the attitude of survey respondents to the performance appraisal. We found that the respondents find performance appraisal a good method for determining variable part of the salary, but only if applied properly (68,8%).

---

[9] Nacional, no. 550, dated 30 May 2006, pp. 32-42

Second hypothesis of this paper was that in Croatia the problem of gender pay gap is not as widespread as in developed western economies. We have shown the data for gender pay gap in Croatia in different industries, as well as gender pay gap in all EU25 member states in 2004. In general gender pay gap in Croatia is 10,5% meaning that in Croatia women on average earn 10,5% less than men. This data is quite encouraging as the average gender pay gap in EU25 is 15%. There are only 7 countries in the EU25 that have a smaller gender pay gap than Croatia (Belgium, Greece, Italy, Malta, Portugal, Poland and Slovenia). All this undoubtedly shows that at the problem of gender pay gap is not so significant in Croatian enterprises as it is in most developed European economies (for example UK- 22%, Germany – 23%, Finland – 20%, Sweden – 17%). Croatia has a smaller gender pay gap than most new EU member states. The highest gender pay gap in Croatia is in manufacturing and it amounts to 22%. Again, this is not so high compared to the highest average pay gaps in the developed western economies.

The third ethical consideration explored in this paper was related to the ethical issues in executive compensation with special attention to the comparison of executive pay amounts to the average employee pay. Our research has shown that most enterprises in Croatia use executive contracts for determining the amount of executive pay. Executive contracts are used both for top managers (in 38,8% of examined enterprises) and middle managers (37,1% of examined enterprises use it both for top and middle managers). Only 16,1% of examined Croatian enterprises do not use executive contracts. This led us to conclusion that the base for determining employee pay and executive pay is not the same and therefore exist possibilities for unethical behavior. Next, we compared the amounts of executive pay to the average employee pay. We used the data provided by Economic institute Zagreb which argues that the range of average employee pay to the executive pay in joint stock enterprises is among 1:7 to 1:10. This ratio is several hundred times smaller than the ratio in the US enterprises. It is also according to Green & Tenneriello's findings who argue that the top-bottom ratio in compensation should be 15 to 1 in small organizations and 25 to 1 in large enterprises. Compared to this theoretical ratios the ratio in Croatia is more than acceptable, as most public joint stock companies in the survey of Economic institute can be categorized as large enterprises. No exploration of executive compensation can neglect the impact of different components of executive compensation to the total amount of executive compensation, especially stock options. In most countries the increase in the amounts of executive pay is the result of use of stock options. In Croatia two independent researches, our and the research performed by the Economic institute Zagreb, showed that only 8,8%-10,6% of examined enterprises use stock options. This is surely one of the reasons why the gap among executive pay and average employee pay is not as high in Croatia. The most used component of executive compensation in Croatian enterprises is short term bonus as it is used in more than a half of the examined enterprises (51,5%). Long term bonuses, on the other hand, are not used in Croatian enterprises.

Finally, although there have been pressures from the public arguing that there are several ethical issues in compensation that need to be examined our research has shown the opposite. Compensation systems in Croatian enterprises are mostly based on objective performance indicators with acceptable gender pay gap and executive compensation. However, it will be interesting to reexamine how will the Croatian approaching to the EU membership influence presented ethical issues in compensation. This research should be taken especially in a few years when Croatia enters the EU.

Key words: *innovative work practices, performance, ESOP, offline teams, online teams*

Abstract

To extend the range of available evidence concerning the effects of innovative work practices (IWPs) on worker and firm outcomes, new survey data is assembled for more than 470 employees (more than 80% of production workers) in a single manufacturing firm in Croatia. There is large variation in participation in online team membership, offline team membership, employee ownership, and incentive pay, and thus our data enable investigation of the impact of both single IWPs as well as combinations of IWPs. We find that amongst IWPs membership in offline teams most often yields favorable outcomes for firms, notably the provision of discretionary effort by employees and the tendency to peer monitor, as well as improved worker outcomes, including job satisfaction, employee involvement and commitment. In addition to offline teams, the other IWPs usually have similar favorable outcomes for firms and workers. Moreover participation in of sets of IWPs that include offline teams and other practices such as financial incentives, is found to yield benefits to both employees and firms. As such our findings provide support for those who argue that innovative IWPs will produce mutual gains. Our findings also help to identify the key channels through which different IWPs are working. We also find several interesting effects from our controls and the effects of gender are often striking with women perceiving that they are less empowered and reporting that they are less willing to engage in peer monitoring.

---

1. INTRODUCTION

There is abundant evidence that innovative work practices (hereafter, IWPs) of various kinds, such as teams, quality control circles, no-layoff policies, job rotation and employee ownership, have spread rapidly in developed market economies during the last thirty years. Freeman, et al.(2000) report survey evidence that, between 1983 and 1993, the number of non-monetary incentive programs offered by firms increased by 500% in the U.S. Similar trends appear to be at work in other countries including the UK (e.g. Wood et al., 2002), Japan (e.g. Kato, 2000) and Finland (e.g. Kalmi and Kauhanen, 2005). While the corresponding evidence for transition economies is much slimmer, the available evidence is also suggestive that such practices are spreading.[2] Unsurprisingly both theoretical and an empirical literature have appeared to examine the impact of IWPs on both business performance and employee outcomes. As different scholars from different fields in the broad area of industrial relations have applied varying approaches to explore diverse research questions, those literatures have grown rapidly. At the same time, it is clear that analytical work of the kind that is becoming commonplace for advanced economies and yet which focuses on developing and transition economies is very slim. Since it is important to determine whether findings for firms in advanced market economies carry over to other economies, the first contribution of this paper is to extend the geographical coverage of the empirical literature. This we do by assembling and analyzing new survey data set for a large Croatian manufacturing firm with our paper perhaps representing one of the first such investigations for a former communist economy.

In addition, there are other reasons why case studies of firms in transition economies are perhaps of special interest. For one thing, some have argued that the legacies of communism will help to shape and constrain contemporary labor-management relations in transition economies. At the same time, Croatia was once part of the Socialist Federative Republic of Yugoslavia (hereafter SFRY), in which a system self-management existed within a communist state. Such a legacy means that examination of the potential of innovative IWPs is perhaps of special interest. Finally, in many former communist countries, often privatization has been accompanied by significant employee and managerial share ownership in the firm at which they work. At our case in Croatia the process of insider privatization was facilitated by the creation of an ESOP and thus it is interesting to try to uncover the ways in which the ESOP and the legacies of self management and communism may help to shape both the design and the effects of IWPs at the case.

Perhaps relatedly, the main contribution of the paper reflects key characteristics of our case and the nature of our data. Whereas most studies tend to examine cases in which attention is focused on one or two IWPs, our case is one in which several IWPs are present, notably offline teams, online teams, incentive pay and employee ownership. In addition there is much variation in participation in these practices amongst employees and also in membership in labor unions. Moreover our survey data has been designed so as to enable us to investigate the impact of IWPs on *both* firm and worker outcomes and to do so for a broader range of such outcomes than has typically been the case in much work in this area.[3] Furthermore, while IWPs are designed to

---

[2] For example Jones and Klinedinst, 2005 report the diffusion of such practices in Bulgaria

[3] Most evidence that uses country surveys, such as Kahaunen and Palmi (2005) for Finland, understandably has tended to concentrate on worker rather than firm outcomes. This is also true of most case studies that examine outcomes collected from employee surveys (e.g. Batt, 2003). By contrast our survey is unusual insofar as it enables us to investigate possible links between various work practices and employee outcomes (including commitment, employee involvement and job satisfaction) *and* outcomes of most interest to firms, such as peer monitoring and the supply of effort. There are other studies, including some of those produced by the shared capitalism project (e.g. Freeman et al 2006 that take a similar tack though they tend not to go as deep within the black box as does this paper. Also there is an important and often neglected body of work that has used employee surveys to look at firm and worker outcomes in firms with very different organizational structures, notably worker owned firms. Studies

bolster firm performance, the empirical evidence on their actual economic effects is often quite mixed.[4] Also, for the most part, there appear to be few studies that have endeavored to use such data to *directly* test hypotheses derived from economic theories such as the impact of IWPs on the nature and extent of peer monitoring and, more generally, on what the key mechanisms are by which different HRMs are expected to produce improvements in bottom-line performance.[5] Hence, in addition to providing evidence on worker outcomes, our survey has been designed to capture information for several other areas of interest that figure prominently in theoretical work, mainly by economists. These areas include the provision of discretionary effort by employees, the extent of horizontal monitoring, the degree of cohesion or cooperation within the organization, the extent to which employees are interested in product quality, and the degree to which employees have knowledge of and interest in their job and its relationship to company goals. In this econometric case study,[6] we use these unusual measures that are derived from data we have collected using face-to-face surveys to investigate the impact of IWPs, such as employee ownership and participation in offline teams, for employee behaviors that are expected to affect firm outcomes. [7]

In turn we are able to investigate whether IWPs deliver benefits and, if so, whether these accrue to employees and/or employers and to determine whether there are mutual gains (Applebaum et al. 2000). Furthermore, given the importance many have attached to packages of IWPs (e.g. Ben-Ner and Jones, 1995) our data enable us to begin to see if there are varying effects to different combinations of IWPs and to see if conclusions reached using data for other cases (with more restricted combinations of IWPs) carry over to this case in which a rich set of IWPs is present.

The structure of the paper is as follows. In the next section we briefly review theory and empirical evidence. Then we overview the case study and its environment and also describe our most unusual data. In the next two sections we examine the impacts of these practices on outcomes for workers and the firm. In the final section we summarize our findings and offer some concluding comments.

2. CONCEPTUAL FRAMEWORK AND EMPIRICAL LITERATURE

In this section we begin by reviewing theoretical and empirical literature as it mainly concerns relationships between IWPs and firm outcomes. This is interwoven with a brief review of the corresponding literature that concentrates on the impact of IWPs on worker outcomes. In both

---

include work by Rhodes, Long, Greenberg, Ros for US firms and Bradley and Gelb for firms elsewhere.

[4] Note that the bulk of evidence on economic outcomes has been derived from firm-level, cross industry surveys. Such studies necessarily have shortcomings such as the inability to control for variation in IWPs within large multi-plant firms. Equally most surveys of this evidence (e.g. Kruse, 200X and Doucouliagos, 1995) find that normally most innovative IWPs such as profit sharing and employee ownership are beneficial to firm performance. However not all assessments are so optimistic -- see for example, Ben-Ner, Jones and Han, 199X.) In part assessments differ because of the varying reliability of findings, that reflects the different types of econometric methods used, underlying data.

[5] There is a neglected history of economists trying to measure some of these variables, including Stafford (1980). More recently, Ros (2001, 2003) is a notable recent exception in attempting to provide evidence on economic hypotheses such as effort supply by using data derived from worker surveys. Unfortunately his findings are restricted in part because of small sample sizes.

[6] The methods and approach used in empirical work variously described as insider econometrics (Ichnioski and Bartel) personnel economics (Lazear (e.g) and econometric case studies often overlaps. The distinctive feature is the use of micro data usually for one firm. Recent examples include. Ichniowski et al (1997), Hamilton et al.(2003) Earlier examples include Barber, Gibbs and Holmstrom (1994).

[7] As such we continue procedures that were developed in earlier work, beginning in 2000 for US firms. See for example Jones et al., 2003.

areas we note that often the picture is muddled with theoretical work in particular tending to yield ambiguous predictions as to the impact of innovative IWPs. Since ours is not a theoretical contribution, here we merely highlight some key themes and focus on those theoretical issues that are most pertinent for our case. In particular we discuss ways in which theory suggests that the key IWPs at our case, namely different kinds of teams, employee ownership and incentive pay, might have potential impacts on important aspects of individual behavior. While we concentrate on theoretical issues relating to the expected impact of *individual* innovative HRM practices such as teams, we also examine theory concerning the potential payoffs to *combinations* of IWPs.

So far as the literature on firm outcomes is concerned, much literature recognizes that the organization of the firm matters for employee behavior (and thus ultimately on firm performance) and thus is necessary to go inside the "black box" that is usually ignored in simple micro-economic theory. Broadly speaking we may distinguish mechanisms that focus on the effect of IWPs that emphasize financial participation, such as employee ownership, from those that stress employee involvement and skills, such as teams.

Labor contracts are necessarily incomplete, providing opportunities for opportunistic behavior by employees and employers. Since the interests of employers and employees may not be aligned, the degree of effort expended by employees is a variable, rather then something that is fully specified in a labor contract. In turn, a literature has emerged that shows how the degree of effort may be affected by particular IWPs such as teams and how these relationships may be affected by other aspects of the firm's institutional set up with a substantial body of theoretical work concerning "team production", and also a related literature on "teams".[8] This literature on "team production" is concerned with the provision of incentives in situations where team output can be observed but individual productivity is unobservable. Dividing the output equally between team members leads to well-known free-rider problems. The early literature concluded that the presence of an outside party is necessary for team production to function, either in performing a monitoring function (Alchian and Demsetz, 1972) or acting as a "budget breaker" (Holmström, 1982). Among subsequent works, the most relevant for our purposes is the literature stressing the role of horizontal monitoring.[9] It has been argued that monitoring functions can be performed more efficiently by employees who observe each other's work effort on a continuous basis (Putterman, 1984). Similarly, it has been argued that teams can achieve first best outcomes once they develop norms against shirking (Kandel and Lazear, 1992).

By "teams" we refer to mainly to work practices in online teams whereby employees work in groups rather than individually and they also have some discretion over their working methods. According to this definition, to some degree, teams have internalized the monitoring function and thus may be less subject to the free rider problem associated with team production. Incentive problems are not the only problems facing teams. Teamwork, both in online and in offline teams, usually involves regular meetings between team members that are not used in productive activities. Teams may also increase employee expectations about increased discretion. If these expectations are not fulfilled, it may create frustration and lower work morale (Heller et al. 1998).

While there are distinct costs associated with working in teams, several authors have suggested that in many situations the advantages outweigh the costs and many have stressed that teams are expected to be associated with improved supply of effort. Thus the important question to understand is it that employees develop norms that protect from shirking and other undesirable side effects of team work. Disciplining of co-workers is likely to inflict psychological costs on

---

[8] Heywood and Jirjahn (2002) also make a similar distinction, though using slightly different terminology.
[9] For other related literature, see the insightful discussion in Dow (2003, ch. 8.5).

employees, and therefore it is not likely that they would engage in it without additional inducements (Freeman et al., 2004). Increasing employee discretion without providing incentives for effort may produce detrimental effects: for instance, employees within autonomous teams that have wide discretion on production methods and the pace of and may use this discretion to work at a more leisurely speed.

If production technology can be characterized mainly as team production, then pay structures tied to individual performance cannot be used. Two relatively widely used alternatives are company based profit-sharing and employee share ownership schemes. Workers who receive more flexible pay are expected to be more committed to their firm, to work harder and smarter and to be more likely to engage in the accumulation of firm-specific human capital. And there exists fairly consistent evidence that these schemes have modest but positive performance impacts.[10] However if employees are members of offline (rather than online) teams, then pay structures tied to individual performance can be used.

It is also apparent that the willingness to engage in horizontal monitoring may vary between union and non-union environments. And the degree of cohesiveness or extent of cooperation between labor and management may be expected to vary between union and non-union forms (though the direction of this effect may vary depending on one' view of unions—contrast Freeman's (not so) new view of unions with the traditional view.

As briefly previously discussed, many stress the need for complementary initiatives. For example, Ben-Ner and Jones (1995) point out that employee involvement alone may not lead to enhanced business performance, especially in the absence of increasing return rights. The coupling of return rights with teamwork may provide the right incentives to engage in peer monitoring and also to withhold from opportunistic use of increased discretion. Several other authors suggest that combinations of various IWPs may be more effective then individual practices, including Ichniowski et. al.(1997) and MacDuffie (1995). However this is not a universal position with, for example, Goddard arguing against this conclusion. Godard (2004) also stresses the role that institutional conditions, notably union attitudes, might play for workplace innovations to be effective. And even amongst those who argue for benefits flowing from combinations of IWPs, disagreements exist on matters such as what exactly constitutes the best set of practices.

Turning to the literature on worker outcomes, since there are very good recent reviews on this matter (e.g. Handel and Levine, 2004) our review will be quite brief. As with outcomes that are apt to be of main interest to employers, again there is no consistent picture in the literature as to whether IWPs are expected to deliver benefits to employees. One camp is often optimistic that workers (as well as employers) may benefit from IWPs. Thus Applebaum et al. (2000) argue that that there are complementarities between IWPs that provide incentives, opportunities for participation and for skill formation. In such circumstances they predict that there will be mutual gains as both employees and employers benefit. This view is shared by Freeman et al. (2006).

By contrast there are many who are much more pessimistic and who expect that workers may suffer in such high performance workplace environments (HPWPs). For example Goddard (2004) and Ramsay (2000) take this view. They expect that employees will not benefit materially from HPWPs and that job stress will be apt to increase. In addition, as many have noted, IWPs may disappoint, and ultimately backfire, because of difficulties related to implementation. [11]

---

[10] For company level evidence, see e.g. Wadwhani and Wall (1990); Kruse (1993); Kumbhakar and Dunbar (1993); Jones and Kato (1995). See also the econometric case study by Knez and Simester (2001).

[11] For example Jones and Kato (2004) document that initially there were positive productivity effects at the case they study but that these benefits were dissipated, arguably because of the failure to introduce a balance set of IWPs.

3. THE RESEARCH AND THE DATA

The firm AD Plastik, which is listed on the Croatian stock market is quite important in the local economy. It is headquartered in Solin (near Split) and its major plant has been located there for more than 50 years. The firm has multiple plants and has established a solid market niche in the broad area of manufacturing plastic products, with a focus on high-quality plastic parts for the automobile industry. During the 1980's, when Croatia was part of the SFRY, what is now ADP was part of a larger group of companies that employed as many as 13,000 employees. ADP emerged during transition and the disintegration of the SFRY when the original company was split into several parts. ADP is one of the few large industrial companies in Croatia that has managed to successfully navigate the problems posed by transition. In 2001, as part of the privatization process in Croatia, an ESOP was used as a vehicle to transfer the bulk of ownership to employees and management and to avoid a takeover of the firm by a foreign company. Currently about 53% of the firm is owned by the ESOP, which with individual employees and managers controls a majority of votes (in fact, around 60%). while the majority of the balance is owned by another corporate entity that is a long time strategic partner of ADP.

ADP is part of a larger group, namely the AD Plastik Group that includes ADP and several smaller companies some of which are located in Slovenia, Romania and Russia. Recently overall employment at ADP has averaged about 1300 of whom about 70% are production staff. Employment has been steady during the last few years, averaging between 1300 and 1350 while employment in the group has fallen from 2073 in 2003 to 1974 in 2005.

Currently more than 90% of ADP' output is exported mainly to customers in Western Europe. The company is doing well and sales have tripled during the last three years and data for several plants show that plants have recorded sustained growth over even longer periods. Investment is at high levels and is reported to average in recent years between 12 and 30% of sales. At the same time, the firm faces an environment that is increasingly challenging. Before 1990 most of its plants tended to face mainly domestic competition (within the SFRY) and had comfortable profit margins. More recently, managers perceive that these margins have become quite thin and that competitive pressures have grown, usually from overseas competitors.[12]

Many, including Appelbaum and Batt (1994) argue that globalization and regulatory changes that have increased competition have compelled firms to consider means for improving productivity by the application of advanced HRM practices such as total quality management or autonomous teams. Such pressures appear to have played a part in the introduction of IWPs at our case. Indeed in interviews with managers many mentioned that they faced growing competitive pressures in the 1990's in their product markets and tougher standards for product quality from their customers, including requirements for IOS certification. Accordingly the firm has been required to make strategic responses to a fast changing situation. Such pressures to change were felt especially strongly after the disintegration of the SFRY. They have been sustained in more recent times as Croatia prepares its candidacy for entry in to the EU.

Several kinds of data were collected from the case. Most important are face to face data from surveys of workers. In addition several interviews were conducted with diverse personnel, including managers and union representatives, at our case, AD Plastics (hereafter ADP). Finally, additional information was drawn from other sources such as annual reports and other internal

---

[12] Some plants are located in metropolitan areas (including the one in Zagreb.) While we do not focus on those plants in this study we note that they have faced a somewhat different situation from the plants we study. Two of them have aggressively entered emerging product markets such as wireless and broadband. Employment at these plants grew at an extraordinarily rapid clip between 1994 and 1999, and both had strong profit positions. However, some executives at these divisions expressed uncertainty about whether these new markets would be sustainable over the long haul – a view that unfortunately proved to be far-sighted.

documents.

The interviews also indicated that ADP uses a number of innovative IWPs including much use of both offline and online teams. Online teams were first introduced about 4-5 years ago with the introduction of a new production line, namely clothing for auto-seats. Now they are used extensively to produce solutions to "technical" problems involved in organizing production. Online team leaders are appointed by management. While online teams are actually together all the time, meetings are held sporadically, under the leadership of the supervisor. They discuss very concrete production and work problems and always meet during work hours. During one site visit we observed online teams in one department with each containing from 10-12 and mainly female workers.

Offline teams were introduced 2-3 years ago. Offline team leaders are appointed by management and the teams work on specific projects. Typically they hold daily meetings while team leaders meet with managers once a week. Offline teams are fully responsible (within the guidelines of the project design, deadlines and budget) for project organization and the division of work on the projects as well as for achieving project objectives. While team meetings are mainly held during regular hours, sometimes meetings extend beyond these times. Offline team leaders also receive training including in project management knowledge and skills as well as in knowledge for the specific project. It is expected that team leaders will transfer the bulk of this knowledge to other team members. Team effectiveness is evaluated mainly by management.

ADP has other practices that provide for extensive information sharing, including quarterly meetings and a monthly newsletter. During quarterly meetings, the labor force learns confidential corporate information concerning new products, new strategies and financial statements. In addition employees receive a monthly newsletter in which they are informed about developments at the firm. ADP is very interested in skill enhancement of employees, especially as this feeds into enhanced product quality. However, most training is in-house or on-the-job. Training that requires new expenditures (e.g. to hire consultants or to pay for courses) appears to be quite rare and has averaged only from 0.05 to 0.14 % of turnover during the period 1998-2003. There are three unions at ADP. Together they represent about 80% of employees.

Turning to financial matters, ADP provides slightly higher starting wages than other comparable firms. However average wages are still below national averages (the industry as a whole pays low wages) though the most recent collective agreement with the labor union provides for wage increase that are about double the recent inflation rate of 3.5%.

ADP has a long history of financial participation and various forms of incentive pay have existed for many years. Incentive pay is often quite complex with varying elements that apply to different groups of employees. Some employees receive piece rates - this is often for employees who work in online teams. There are several schemes that reward good quality with payments running as high as 50% of the base wage. Then there are special awards for exceptional results by selected production workers ("worker of the month"). Members of offline teams may also receive rewards based on the importance of the project, their position in the team, and the results achieved.

The ESOP at ADP was created in 2001 in an attempt to curb a hostile takeover by a Canadian-based firm. The idea was originated, developed and carried on basically by the top-management, but they succeeded in getting a massive involvement of employees (more than 90% of employees at the time joined the ESOP). Employees were offered two different 'packages' of shares. The smaller package was worth approximately 3,500 Euro, while a larger one was worth

approximately 10,000 € Only a few, mostly top-managers, acquired the larger package. (This was not perceived as a privilege, but more as a sign or expression of a strong commitment and convincement 'to the cause' of the top-management). The acquisition was supported by the 5-year loan from a large Croatian bank, and presupposed that the annual dividends would be sufficient to repay the loan. However it turned out that dividends were able to cover 90% of the first annuity, and in the second year they covered only 60% of the annuity. The balance had to be taken from regular salaries. That induced more than 300 people to drop out of the ESOP during first two years (their shares were offered to the rest of ESOP members and non-members; 41 member accepted that opportunity to increase their package, and 7 new employees entered the ESOP). Today, there are 518 employees actively involved in the ESOP.

At the same time, it was apparent that the firm did not have accurate information on the extent to which employees participated in many of these IWPs. To provide more accurate information both on the incidence of IWPs as well as their effects on employee attitudes towards and behaviors resulting from the IWPs, we administered a survey. By surveying employees at two plants, we were fortunate to collect more than 470 surveys, which gives us an impressive response rate of about 36% for all employees at ADP and more than 50% for those groups of workers and plants at which the exercise was focused.[13] Moreover, when we compare basic demographic characteristics of the sample with the characteristics of the total work force we see that the sample is quite representative.

The average worker surveyed at ADP was 39 years old and has worked at the firm for more than 11 years. About half of the workforce is female and about two in three are currently married. There is a wide spread in the highest level of educational attainment. While 12.6 % of workers have completed a four year degree course, almost 10% of employees did not even complete grade school.

The descriptive statistics also indicate that there is wide dispersion amongst the labor force in their participation in innovative IWPs. On average between 42.8% and 67% of employees participated in one of the four key IWPs that we have identified. The highest rate of participation is in offline teams (67%) while fewer than 43% report that they are in an online team. However for those who are in an online team, more than 58% of respondents report that they belong to teams that are self-managed. About half of the respondents were union members. The research provided additional information on the incidence of participation rates in combinations of IWPs within ADP. Again we observe much dispersion in participation rates in these practices. As much as 65 employees (about 14% of respondents) were in both offline teams and the ESOP; however, 137 (about 30 %) were in neither plan. By comparison, 99 employees (about 21% of respondents) were in both online teams and the ESOP, while only 80 employees (about 17%) did not participate in either plan. Interestingly 28 employees (about 7% of respondents) report that they were in both online and offline teams, as well as the ESOP, and also that they received incentive pay. By contrast 53 workers (11%) report that they were in no practice. Or, in other words, almost 90% of employees participated in at least one HRM innovative practice.

---

[13] The questionnaire builds on core questions that have been used in previous work with which one of the authors has been associated, e.g. Jones et al., 2003. Thus the survey is "customized" to reflect specific features of the HR set-up at a specific firm. Most questions use Likert type scales and solicit employee responses in worker outcome areas such as job satisfaction and trust and on issues that are more likely to be regarded as relating to firm outcomes such as willingness to engage in peer monitoring and the provision of discretionary effort.

4. THE EFFECTS OF IWPS ON FIRM AND WORKER OUTCOMES: SIMPLE HYPOTHESIS TESTS

In this section we begin to provide evidence on the impact of IWPs on firm and worker outcomes by comparing a wide range of outcomes for participants and non-participants and conducting simple hypothesis tests. Since some of our interests are in what is a relatively new line of inquiry, the available literature with which to guide our research is rather limited. Hence often we employ alternative measures for key ideas — for example, to measure discretionary effort we use measures of both absolute and relative effort. We proceed in two steps. First, the method was to focus on only one HPWP at a time. We compare outcomes for those who are (are not) members of (i) offline teams; (ii) online teams; and (iii) the ESOP. Finally, for the subset of workers who are in an online team we examine whether it matters to be in a self-directed team.

Next, reflecting our interest in the effects of combinations of IWPs, we identify four interesting sets of innovative HRM polices within the case.[14] For example the first combination is for those who participate *both* in an offline team *and* the ESOP; outcomes for that group are compared with those who participate in *neither* offline teams nor the ESOP. In the final set of such comparisons we compare outcomes for those who participate in all core practices -- in online teams, in offline teams, in the ESOP and in the incentive pay scheme -- with those employees who do not participate in any of these practices. In all exercises findings are reported under several categories of outcomes. While many of these dimensions are reasonably standard in the literature, namely empowerment, communication, commitment, trust, job satisfaction, intrinsic rewards and job stress, others are more novel, particularly effort and teamwork/peer monitoring.[15] In all of these exercises we use *t-tests* on means to determine if there are statistically significant differences in outcomes for employees who do/do not participate in one or a set of IWPs.

From the statistics it is clear that membership in an offline team by itself tends to be associated with both enhanced worker and firm outcomes. For most categories, statistically significant differences exist between members and non-members for the bulk of questions within each block. Thus both questions concerning empowerment indicate that offline team members believe that they are more empowered than those who are not in such teams. A similar picture prevails for four of the five questions concerning different ways of capturing communication. By using two measures of effort as well as data on hours worked, members in offline teams report that they work harder and longer than do their peers who are not in such teams. The data on offline teams also show that team members are more committed to the company than those who are not in such teams, are more trusting of the firm, have higher levels of job satisfaction and they experience higher levels of intrinsic rewards.. Furthermore members of offline teams are much more likely than those who do not belong to offline teams to engage in peer monitoring — to say something to a worker who is slacking off. The only area in which offline team membership is not associated with a statistically significant enhanced worker or firm outcome is job stress where no differences are apparent.

Based on the research data, we make two observations. First, in some cases we observe that it is another practice that appears to be having a bigger effect on an outcome then does participation

---

[14] Of course this is not an exhaustive list of combinations or categories. We could, for example, make comparisons with those in intermediate categories—such as participating in only one HRMIP. In future work we may extend the range of comparisons.

[15] While many of these dimensions are frequently examined in the literature (e.g. Capelli and Neumark, 2001; Batt, 2004; Freeman et al, 2000) unsurprisingly the particular language questions used varies. As already noted the specific wording in out questionnaire builds on core questions that have been used in previous work with which one of the authors has been associated, e.g. Jones et al., 2003. Also the questionnaires used in those earlier studies include some novel adaptations of questions in some areas, including the provision of effort.

in an offline team. For example, compared to membership in an offline team, membership in a self-directed online team is observed to have larger effects on several outcomes concerning communications. Second, in the main, the general pattern observed for offline teams carries over to the other practices for which we report evidence. However, the evidence is not quite as compelling. Thus, membership in the ESOP does not reveal marked differences concerning commitment, and online team membership is not linked with many significant differences concerning teamwork/peer monitoring. Also while belonging to a self-directed team usually is associated with more teamwork and more peer monitoring, this is not found for all questions. At the same time in the bulk of instances the findings indicate favorable worker and firm outcomes for participants. Consistent with those who hypothesize that IWPs will deliver benefits to both workers and firms we also find that participants in all of the IWPs communicate more often than do non-participants with managers and supervisors outside of their work groups or teams and also communicate more often with workers outside of their work groups or teams. Participants in all practices are also found to put more effort into their work and are more satisfied with their work. Again there is no evidence that stress levels differ for participants and non-participants in the other IWPs.

After these single-dimension research, we turn to combinations of innovative IWPs. The evidence is broadly supportive of predictions that combinations of IWPs will be expected to be associated with better worker and firm outcomes (compared to situations when there is no participation at all.) Anayzing outcomes for those who are (are not) in an offline team and an ESOP, we see a consistent evidence that this pair of IWPs is associated with favorable outcomes for workers and for the firm. For most categories, statistically significant differences exist between members and non-members for the bulk of questions within each block. Workers who are in offline teams and in the ESOP report that they are more empowered, engage in more frequent communications, are more committed, have more job satisfaction and have higher intrinsic rewards. They also work harder and undertake more peer-monitoring.

When we consider the impact of membership in offline teams together with incentive pay, the results are virtually identical to those found for participation in an offline team and an ESOP. By comparison with findings for the ESOP-offline combination, findings for the offline-incentive pay combination are slightly weaker only in the area of commitment. But again in most categories, statistically significant differences exist between members and non-members for the bulk of questions within each block. Workers who are in offline teams and who also receive incentive pay, report that they are more empowered, engage in more frequent communications, have more job satisfaction and have higher intrinsic rewards. They also work harder and undertake more peer monitoring.

Very similar patterns of effects prevail concerning outcomes for the remaining pairs of IWPs. When we consider the impact of membership in online teams together with either participation in the ESOP or receipt of incentive pay, the results are virtually identical to those found for combinations involving participation in an offline team, especially the pair including participation in the ESOP. Moreover, the findings are virtually unchanged when we contrast outcomes for those employees who are in *all* practices with those who belong to none.

In sum, the evidence from both parts of the research support for the general proposition that HRM IWPs are associated with better worker and employer outcomes — innovative WPs can deliver mutual gains. The analysis indicates that when workers participate in HRM IWPs, they develop stronger sense of empowerment, achieve more intrinsic rewards from their jobs as well as higher levels of job satisfaction. In turn, these empowered and more satisfied workers tend to trust management more and develop stronger commitment to the firm. These attitudinal changes are accompanied by behavioral changes. When workers participate in HRM IWPs they tend to

have more open and more frequent communication with management (as well as with their coworkers), exert more effort (shirk less) and engage in more peer monitoring (or horizontal monitoring). Finally, HRM IWPs are not associated with increased stress. As such HRM IWPs appear to offer a strong point of hope, even in firms that face a difficult environment, such as those in transition countries.

5. THE EFFECTS OF IWPS ON FIRM AND WORKER OUTCOMES: MULTIVARIATE ANALYSIS

In this section our main aim is to see if the conclusions yielded in the exercises reported in the previous section carry over once we introduce additional controls. To this end we estimate a variety of ordered ***probit*** models concerning diverse employer and employee outcomes. In essence we estimate three sets of models for each outcome. In the baseline models, as well as controls for personal characteristics (tenure, age and gender), we include only one HRM IWP.[16] Besides our four core IWPs (offline teams, online teams, ESOP, and incentive pay), for the subset of workers who are in offline teams we also consider whether it matters to be in a self-directed team. We are also able to investigate the impact of union membership in a similar fashion. The remaining two sets of probits reflect our interest in the impact on worker and firm outcomes of *combinations* of IWPs. In the second set of exercises, we investigate the influence of several *pairs* of IWPs that we have previously examined using simpler methods. Reflecting our earlier theoretical discussion these are constructed so as to combine membership in one type of team alongside some mechanism for financial participation. In the last sets of exercise we include information on all four IWPs and then, in separate regressions, we also consider the effect of union membership as well as all four IWPs. The final thing we do in this section is to begin to compute and report selected marginal effects in order to see if the effects that we uncover are not only statistically but also economically significant.[17]

The results are for two alternative measures of discretionary effort — first measure is a measure of *absolute* effort while second attempts to get at *relative* effort.[18] With these (and other) results, it is important to remember the precise variable definitions that we use. Specifically, online team membership, offline team membership, incentive pay, union membership and self-directed team membership are defined so that membership = 2 and not being in a team = 1. Consequently, in both cases, a *negative* coefficient on any of these variables implies that being in any type of team (or receiving incentive pay or being in a union) means that *more* discretionary effort is being expended. By contrast, the definition for the ESOP variable is more traditional, namely on the ESOP = 1 and not in the ESOP = 0, so that a *negative* coefficient on ESOP means that *less* discretionary effort is being expended.

From the set of models researched, we see that there is evidence that teams of both types enhance the provision of effort, and that this is also the case for incentive pay. By contrast, neither union membership nor participation in an ESOP is found to have a statistically significant effect on the supply of discretionary effort. Examining the impact of pairs of practices we see

---

[16] Replication of the results reported in this section but also including controls for several categories of education and wages (which is also measured as a categorical variable) is underway. Thus far findings are not sensitive to these modifications.

[17] In future work we will do this more systematically. In addition, in future work we will expand the number of specifications that we will estimate to explore issues of complementarities either by developing interactive measures of by creating systems of practices. In view of the number of observations set alongside the number of practices, the latter might be the only feasible way to proceed. In earlier work (Jones and Eva, 1997) this was the tack taken in a firm-level study that used firm-level data and developed systems of practices.

[18] This variable is normalized with reference to effort spent watching TV.

that membership in an offline team enhances the supply of effort in both models, though in these cases there is no additional impact from financial participation. In the other two regressions, in one instance online team membership is associated with more effort, other things equal, while in the other case only incentive pay (and not online team membership) has a positive impact on the supply of effort. As in the most restricted models, neither union membership nor participation in the ESOP is found to matter for the supply of effort. The final set of models include all IWPs. Reassuringly we still find that offline team membership enhances the supply of effort, though now no other IWP or union membership has an effect. In addition, and as in all other models, we observe that, having controlled for tenure, it is older workers that report that they supply more discretionary effort.

The key finding is that, as with the results for absolute effort, membership in an offline team is consistently found to enhance effort supply. This is found in all specifications, both those in which that HRM is included alone or alongside other measures of financial participation and in the fully augmented models. In addition, and unlike previous findings, in all models we find that membership in an ESOP will enhance the provision of effort when effort is measured in this relative way. For this measure of effort, the fully augmented models provide evidence that the remaining IWPs also matter for effort supply, though this does not show up in the more parsimonious specifications.[19] We find that older workers report that they work harder. In addition, the negative and significant coefficient on gender means that in many specifications there is evidence that men believe that they are more likely than are women to work harder.

We investigate also the impact of IWPs concerning, respectively, whether respondents have engaged in horizontal monitoring and also their willingness to horizontally monitor. The results reported are particularly striking. We find that membership in both online and offline teams is associated with a greater willingness to engage in horizontal monitoring.[20] To some extent this finding is mirrored for offline teams, since we observe statistically significant and positive coefficients for that HRM. For the most part no other HRM IWP is found to affect monitoring. Also the results for some controls reveal an interesting story. They indicate both that women are typically softer on monitoring (compared to men) and also that older workers are apt to monitor more.

In the following part of the research we turn to the first measure that relates to a worker outcome, namely empowerment (decision-making ability) or employee involvement (measured by 'my say in what happens on my job'). In several respects the two measures yield similar results and findings. A clear picture emerges that all IWPs enhance employee participation, both alone and in combinations. This is perhaps most evident concerning the impact of offline teams. For both measures of employee participation we find that in *all* specifications offline teams lead to employees perceiving that they are more empowered. This pattern is also essentially repeated concerning ESOPs — the coefficient on ESOPs is consistently negative and statistically significant (where the ESOP dummy is measured as 1 = in the ESOP and 0 = not in an ESOP.) Findings are also reasonably strong concerning the other two IWPs, the incentive system and online teams. In all specifications the incentive system is always found to be an HRP that enhances the average employees' sense of empowerment. For online teams the evidence of positive effects is a little spottier.

The evidence also indicates that union membership does not play a role in accounting for differences in perceived levels of participation. Finally, so far as employee characteristics are

---

[19] It is important to remember that for these and other results, since different numbers of observations are usually involved in the different specifications, that findings from different estimates are not usually directly comparable.
[20] Again a positive coefficient on offline team means I am more willing to horizontally monitor if I am a member of a team, SINCE 1 = IN TEAM AND 2 = NOT IN TEAM

concerned, the coefficient on gender is consistently positive in both sets of findings thus indicating that it is men, rather then women, who report that they have a greater say in their job, even after controlling for benefits for participation that flow from innovative WPs. While cultural differences between men and women presumably play a role in accounting for this difference (and other gender differences in outcomes), an interesting line of inquiry would be to pursue the reasons for these differences more thoroughly.

For membership in offline teams, participation in the ESOP, and receiving compensation in part through the incentive system the evidence is very strong that each of these IWPs alone as well as in combinations is associated with enhanced job satisfaction. This is the finding for these three IWPs in all specifications. For online teams the evidence is also strong, with coefficients on that variable not attaining customary levels of statistical significance only in the fully augmented models.[21]

While the pattern of the findings on job satisfaction thus mirrors some of the results reported for other outcomes for workers and the firm, there is an important difference in the factors that account for differences in job satisfaction. The membership in a labor union is also found to enhance job satisfaction -- no similar effects of union membership were observed for other outcomes. There is also a novel finding concerning one of the controls, namely for tenure, for which the net positive coefficient implies a negative effect on job satisfaction for longer tenured workers. As with empowerment, men report more job satisfaction than do women, other things equal.

Analyzing the impact of IWPs on communications, there is evidence that IWPs play a role in accounting for variation in this employee outcome. This is especially the case for both types of teams for which, except in the fully augmented models, team membership is always found to matter at customary levels of statistical significance. There is also some weaker evidence that participation in the incentive plan is associated with greater frequency of communications between respondents and other groups. By contrast participation in the ESOP (and union membership) play no role. As for controls, the positive coefficient on gender means that women report that they are apt to communicate less frequently than men.

The evidence offers quite strong and additional support for those who hypothesize that high performance workplace practices such as teams and mechanisms for financial participation will deliver improved outcomes for employees. In all specifications it is the case that membership in offline teams and participation in the ESOP is associated with employees reporting higher levels of commitment to the firm. The evidence is also reasonably strong that membership in online teams leads to improved commitment while, for incentive pay, there are also some indications that this too plays a role. By contrast, union membership has no effect one way or the other. Since the net tenure coefficient is positive our results also indicate that workers who have longer tenure have weaker commitment to the organization.

Compared to some of the findings emerging from the research, the evidence on the impact of IWPs on the likelihood of employees engaging in team-like behavior (as they assist their peers in various kinds of on the job training) is relatively weak. As with many other outcomes it is offline team membership that is found to have the clearest and most consistent effects, with membership in an offline team enhancing the likelihood of employees assisting other employees in on the job training. While the evidence for other IWPs is more spotty, nevertheless such evidence is present and is especially evident in the preferred specification when, beside offline team membership, teamwork is also facilitated by membership in the ESOP. However, and rather surprisingly, we also find that online team membership tends to undermine team-like behavior. The evidence

---

[21] These are the preferred specifications.

also indicates that tenure and age play significant roles in accounting for differences in the propensity for employees to engage in team-like behaviors. Thus the net positive coefficient implies that workers with longer tenure are apt to engage in less team-like behavior, as are older workers.The findings offer evidence on the role of IWPs concerning intrinsic rewards. This is measured by how well employees regard their job as making use of their skills and knowledge while in the other case we look at the importance of what workers do at work relative to what they earn. For both measures of intrinsic rewards again we find that the HR practice that appears to enhance this outcome in the eyes of employees is membership in most specifications in offline teams, though other IWPs are found to be statistically significant in the fully augmented specifications. However, when intrinsic rewards are measured by knowledge and skill membership in online teams arguably plays an even more consistent role than does offline team membership. In both cases, IWPs that provide for financial participation typically do not appear to have much effect, though the ESOP variable is statistically significant. So far as controls are concerned, for this outcome gender appears to be playing the biggest role.

The last outcome we investigate is Trust. Perhaps surprisingly in view of our earlier findings it is policies that promote financial participation that loom largest in these specifications.

The final task in the section is to compute and report marginal effects in order to see if the effects that we uncover are not only statistically but also economically significant. One set of illustrative exercises is to compute selective marginal effects concerning the willingness to horizontally monitor. When this is done we find that the magnitudes of the effects typically are economically significant but not that large. Thus "*if I am not a member of an offline team (rather than a member) then the probability of my strongly disagreeing with the statement concerning my willingness to horizontally monitor is calculated to be 1.9 percentage points higher (category 4), 10 percentage points higher (category 3), 6.5 percentage points lower (category 2) and 5.4 percentage points lower (category 1)*". As we have already noted, the evidence also suggests that women are less likely than men to be willing to monitor. Furthermore we find that, compared to a man, a woman has a 5.6 percentage points lower probability of strongly agreeing with the statement concerning willingness to horizontally monitor (category 1), and a 2.1% higher probability of strongly disagreeing with the statement concerning willingness to horizontally monitor (category 4).

In sum, the evidence reinforces that presented earlier. Often there is pretty solid support for the broad hypothesis that HRM IWPs are expected to be associated with better worker and employer outcomes. The analysis indicates that when workers participate in HRM IWPs, they develop stronger sense of empowerment, achieve more intrinsic rewards from their jobs as well as higher levels of job satisfaction. In turn, these empowered and more satisfied workers tend to trust management more and they develop stronger commitment to the firm. These attitudinal changes are accompanied by behavioral changes. When workers participate in IWPs they tend to have more open and frequent communication with management (as well as with their coworkers). This leads them to exert more effort (to shirk less) and to engage in more peer monitoring (or horizontal monitoring). Finally, HRM IWPs are not associated with increased stress.

While the evidence indicates that all IWPs have beneficial effects for both worker and firm outcomes, the most consistent findings that emerge from the multivariate analysis are for the favorable effects of offline teams. In addition to offline teams, we also find that other IWPs have favorable outcomes. Therefore, adoption of sets of IWPs that include offline teams and other practices such as financial incentives, will yield benefits to both employees and firms.

6. CONCLUSION: FINDINGS AND IMPLICATIONS

In this paper we undertake a variety of exercises including estimating various ordered ***probits*** models to investigate the impact of innovative IWPs separately and in combination for a case (enterprise) located in Croatia. The findings reported in this paper are preliminary and, as we indicate at various points additional exercises might usefully be undertaken. These include expanding the number of specifications that are estimated to explore issues of complementarities, either by developing interactive measures of by creating systems of practices and more systematically estimating and reporting the marginal effects for different practices. Nevertheless, even at this stage in our work, we believe that we are able to draw some interesting conclusions.

The most clear and compelling finding is that amongst the different IWPs it is membership in offline teams that most often yields favorable outcomes for both workers and firms. But in addition to offline teams, we also find that other IWPs usually have favorable outcomes and that participation in sets of IWPs that include offline teams and other practices such as financial incentives, is found to yield benefits to both employees and firms. Membership in online teams (and to a lesser extent in offline teams, in an ESOP and a flexible compensation system) is associated with workers who perceive that they are more empowered, satisfied, committed, trusting, and communicative. In turn this results in their working harder and their being more apt to engage in peer monitoring. These conclusions consistently emerge from several exercises including our estimating various ordered probits models and when we investigate the impact of innovative IWPs separately and when we investigate the impact of pairs and larger combinations of IWPs.

As such, our findings provide support for those who argue that innovative work practices will produce mutual gains and deliver benefits to both workers and firms. In this general sense ours is not an original finding — while the overall body of evidence is ambiguous, some do argue that increasingly there is a body of evidence that suggests that, when properly introduced, HRM IWPs may have beneficial effects.[22] Thus our findings might be viewed as contributing to what might be viewed as an emerging consensus. But amongst that body of evidence our findings may carry more weight than findings derived from some other studies. They are derived from a single econometric case and thus we avoid the problems of firm heterogeneity that plague attempts in many studies to disentangle relationships between IWPs and firm or worker outcomes. Moreover, in investigating relationships between HRM IWPs and particular worker outcomes, notably absolute and relative work effort and peer monitoring, our approach arguably includes measures that improve over those used in most previous studies. As such our findings may also be viewed as helping to identify some of those channels that might be playing the most important roles in accounting for the ultimate improvements in business performance that many associate with HRM IWPs.

In turn sometimes our findings differ in important particulars from findings contained in other recent studies. We find that all four IWPs are often associated with favorable worker and firm outcomes. This differs, for example from Kruse et al. (2006) who report that being a member of an ESOP was often associated with negative outcomes.[23] In our case, the beneficial effects of

---

[22] For the U.S. studies include those by Appelbaum et al. (2000), Black and Lynch (1997), Freeman et al. (2000), Helper (1998), Ichniowski et al. (1997), Levine and Tyson (1990), MacDuffie (1995), and Neumark and Cappelli (1999). For the interesting case of Japan see Jones and Kato (1995) and Kato (2000).

[22] This includes previous work by one of the authors where, together with Kato, some exercises similar to those reported in this paper and for comparable outcomes are reported for a group of cases in central New York (see Jones at el, 2003.) In addition see again for Finland Kalmi and Kauhanen (2005) and papers emerging from the Shared capitalism project, such as Freeman et al., 2003, 2004 and 2006.

[23] Similar findings concerning the ambiguous impact of ESOPs have been found in many other studies — see, for

ESOPs may reflect the particular historical circumstances attending the introduction of the ESOP in this particular enterprise. Perhaps the legacy of self-management plays also a role as might the co-existence of a strong labor union, as hypothesized by Goddard (2004.). Furthermore, we find that there are a number of interesting points concerning the role played by different controls. In particular the effects of gender are often striking with women perceiving that they are less empowered and found to be less willing to engage in peer monitoring. Also different controls are found to play differing roles for different IWPs. In the main, these differences concerning controls do not appear to have figured prominently in previous work.

It is also important to emphasize that the firm and workers that we investigate in this case tend to be different from those covered in most of the existing literature. Our study is one of the first to report findings on these diverse issues for workers in a transition economy. It is reassuring to find that support for optimistic hypotheses and evidence in the received literature concerning the impact of innovative IWPs, which were largely based on firms and workers with other characteristics, also carry over to our case. Indeed arguably our findings provide some of the clearest evidence that HRM IWPs can deliver benefits to all parties, even to firms that do not operate in the most advanced market economies and in economies where legacies might be expected to hinder the effectiveness of certain IWPs.

One interesting question that arises form our findings is that, if as appears to be the case, the benefits delivered by IWPs at ADP to both workers and the firm are so clear, especially for offline teams, then what determines which workers participate in particular practices and why is participation in these IWPs not more widespread at the case. In some unreported work we take a preliminary stab at that question and run some simple probits. We find that there are strong differences in the characteristics of workers who participate in each HRM practice. Thus it is clear that older workers are more likely to be a member of an ESOP while age does not play a key role in accounting for participation in other IWPs. Presumably in part this reflects higher average wealth of older workers (as well as a greater likelihood of their eligibility to participate in the original privatization process through the ESOP). Union members are also less likely to be in the ESOP. In future work we plan to examine this question in more depth, including for combinations of IWPs and more closely examining the extent of potential information failures for both employees and employers.

1. Introduction

Privatization of the socially-owned companies in Slovenia was based on the compromise model, which in most of the companies introduced new owners: employees, investment and state funds.[1] Therefore, the main reproach of Slovenian companies is that corporate governance in Slovenia is too "insider- oriented" and not transparent and that the system is not contributing to the higher efficiency of the companies (Berglof, 2006). The next issue frequently linked with the Slovenian corporate governance system is an unfriendly relation towards foreign investments, which is connected with the government and its influence on the business system as well as with difficult
entry of foreign companies in the network of Slovenian companies. Those networks are usually governed by financial institutions created during privatization (investment and state funds) (Pahor, Prašnikar and Ferligoj, 2004).

Due to the fact that Slovenia is one of the most successful transitions countries with GDP growth of 3.5 percent during the last 15 years and that it will, as a new EU member, at the beginning of 2007 receive the full membership in EMU, the question emerges on how a

---

[1] Prašnikar and Svejnar (1993).

somehow unusual ownership structure and close relationships among companies within the local ownership networks influence the economy. A microeconomic analysis of the investment behavior of privatized Slovenian companies has shown that companies have limited defensive restructuring, while strategic restructuring is at the appropriate level (Domadenik, Prašnikar and Svejnar, 2006).

This article analyzes the turnover of management board members in 211 Slovenian companies during 1998 and 2002. We have a complete database that contains enough variability for this period.[2] Available empirical evidence shows that there is an inverse relation between management turnover and company performance, indicating that owners replace poor performing managers (Weisbach, 1998; Warrner, 1998; Rennebogg, 2000). There is also a question of whether inside or outside owners are more active. It is generally considered that outsiders are better owners than insiders (Frydman et al., 1996; Boycko et al., 1996; Earle and Estrin, 1997; Estrin and Roosevear, 1999). We were also interested in the distinction between the outsider owners (state and investment funds or state as an direct owner of the companies). Data used in this article enable these analyses.

In the article we state that the relation between total sales growth and the turnover of management board members is weak but significant. A stronger relation is found in poorly performing companies. None of the owners has a prevalent role in the turnover process. In the group of better performing companies the management turnover rate is higher if the state's ownership share is higher. Management turnover is therefore a corporate governance mechanism in Slovenian companies; however its extent is limited.

The article is structured as follows. Introduction is followed by the review of the theoretical framework concerning the relationship between management turnover and company performance. In the third part we present the data, methodology and the main hypotheses, and continue by analyzing the characteristics of management board members. The fifth part presents the results of the empirical analysis, explaining the influence of company performance and ownership structure on management turnover. Conclusions are presented in the sixth part.

---

[2] We were not able to measure the performance of companies on the turnover of CEOs because we only had information on whether a CEO was replaced during the studied period. Since the turnover of management board member was strongly linked with the turnover of CEOs (Knežević Cvelbar, 2006), our analysis is correct.

2. Influence of Company Performance and Corporate Governance System Characteristics on Management Board Member Turnover

2.1. Influence of Company Performance on Management Board Member Turnover

Theoretical background on management turnover originates from research on company performance and corporate governance mechanisms using the principal-agent theory. The agency theory (Jensen and Meckling, 1976) examines the problems and partial solutions in the principal-agent relationship, in which one party (the principal) delegates decision-making responsibilities to another party (the agent) and compensates it.

According to the agency theory, management turnover is an important instrument of corporate governance. An agency relationship exists when the welfare of one party depends on actions of the other party. In this relationship the agent is the operating party and the principal is the party affected by the agent's actions. The interests of the agent and the principal differ, which means that both parties wish to maximize their benefits (Ross, 1973). Managers that have access to a company's internal information could use it to their own advantage (moral hazard) and their actions might be in contrast with the stockholders' interests of maximizing the value of equity capital. The agent's actions might not be transparent to owners and consequently the stockholders must control managers to protect their own interests. The relationship between a company's expected and realized performance determines the likelihood of management turnover. In the case of a company's unsuccessful performance managers are punished by reduced compensation and dismissal. Fear of dismissal is a form of encouraging managers to improve their results and behave in accordance with the interests of owners (Holmstrom, 1979; Ross, 1973).

Empirical studies show an inverse relation between performance and the possibility of management turnover (Warner et al., 1988; Weisbach, 1988; Jensen and Murphy, 1990; Murphy and Zimmerman, 1993; Denis and Denis, 1995; Lausten, 2000; Brunello et al., 2000; Kaplan, 1994a, 1994b; Kang and Shivadasani, 1995; Renneboog, 2000). However, they do not offer a

general performance measure. Some use stocks' market price, others use companies' financial statements, and some use both. In addition, interesting differences appear in studies regarding the reaction time for management turnover. In countries where the external system of corporate governance is present,[3] managers are replaced because of disappointing current

---

[3] Characteristics of the external system of corporate governance include: diversified ownership structure, liquid and developed capital market, protection of minority shareholders, present fear of acquisition and short-term orientation of investors. The external system of corporate governance is present mainly in Great Britain and the United States of America.

performance (Warner et al., 1988; Weisbach, 1988; Kaplan 1994; Franks et al., 2001; Coch and Hughes, 1995), while in countries with an internal system of corporate governance they are replaced because of the disappointing past performance (Kaplan, 1994; Kang and Shivdasani, 1995). Such empirical studies are rare in transition countries but the ones that exist also report on the inverse relation between management turnover and company performance (Gibson, 2003; Eriksson, 2005; REB, 2003; Frydman et al., 2001; Warzynski, 2001; Fidermuc and Fidermuc, 2006).

2.2. Influence of Ownership structure on Management Board Member Turnover

According to Denis et al. (1997), the probability of top management turnover is positively correlated with the size of external ownership. This could be an indicator that external owners are better controllers than internal owners, especially managers. Demsetz (1986) states that management ownership is determined endogenously with the goal of efficient internal control. Management ownership in a company can therefore increase the defensive position of managers in fear of replacement, which is particularly problematic if an incapable manager is in charge. Mikkelson and Partch (1996) and Denis et al. (1997) claim that there is a negative relation between the probability of management turnover and management ownership in a company. The authors also conclude that management susceptibility towards replacement decreases with their increasing ownership share in a company. On the contrary, Weisbach (1988) in his research does not confirm the correlation between these two variables. This can be explained with Jensen's hypothesis (1993) on convergence of interests, which states that management ownership helps with converging the interests of managers and owners. De Angelo and De Angelo (1985) also claim that it is sensible for company ownership to have managers. They see compensating management with a share in company ownership as a good motivational strategy because the management will strive to maximize the interests of owners. Because managers themselves are owners, the agent costs are reduced.

In accordance with different perspectives on the role of managers, we wish to answer the question whether managers and other employees are really less effective owners compared to external owners (investment funds, domestic and foreign non-financial companies and other owners, especially the state). Due to a still significant ownership of internal owners, the discretionary power of managers in Slovenian companies is relatively high (Prašnikar and Gregorič, 2002).

According to international studies, a manager's tenure and age are two key factors in the process of management turnover, in addition to the identity of owners. No uniform results exist in the literature regarding tenure. Some studies claim that there is a negative correlation among the variables (Puffer and Weintrop, 1991; Dennis et al., 1997), while others state that there is no significant correlation (Kim, 1993). In addition, studies show (Jensen and Murphy, 1990; Chevalier and Ellison, 1999; Lausten, 2002; Barro and Barro, 1990) that the probability of management turnover increases with their age, i.e., an older manager is more likely to be

replaced. The reason for replacement in these cases is mostly retirement and not a company's disappointing performance. However, the inclusion of both variables in the model is problematic because the variables are often interconnected. Because of this we will in this article test the influence of tenure on management turnover.

3. DATA AND METHODOLOGY

3.1. Sample Description

Primary and secondary sources of data were used to test hypotheses regarding management turnover factors in Slovenian companies. Primary data were obtained from research that was carried out in companies. The research was organized within the Institute for Southeastern Europe (ISEE) between May and September 2003. Used variables from the research include the share of replaced management board members, ownership structure and management board members' tenure from 1998 to 2002. The survey was sent to 623 Slovenian companies and 211 of them returned completed surveys. Secondary sources of data were obtained from the registry of the Agency of the Republic of Slovenia for Public and Legal Records and Services. The registry includes data on more than 38,000 companies. The entire database required for analysis pooled the data from both sources.

In terms of size, 9.7 percent of companies are considered small companies, 76 percent medium-sized companies and 14.3 percent are large companies. Companies that participated in the 2002 survey on average had 479 employees, which represents 20.1% of all employees in Slovenian companies, and created 19.5 percent of total turnover of all Slovenian companies. Sales growth of an average company in the sample in the studied period was 11 percent.

The ownership share of state funds (Slovenian Restitution Fund and Pension Fund Management) and authorized investment funds in the studied period totaled 28 percent, which equals the ownership share of domestic and foreign legal entities (in the rest of the companies). Internal owners on average had a 23 percent share (Figure P_1 in Appendix).

3.2. Methodology and Hypotheses

The use of panel data at the company level offers several important advantages in studying management turnover. First, it enables the removal of the bias that occurs with pooling data by companies with the goal of assessing a certain model and therefore reduced the measurement error. Second, the analysis encompasses heterogeneity of explanatory variables by companies and through years, which assists in identification of key parameters. On the other hand, sources of data on the company level are often biased in their inclusion (usually it is presented in including larger units) and deficient in types of information they offer. Since a hypothesis on the sample's bias in terms of population in our case has already been tested and

rejected (Knežević Cvelbar, 2006), our analysis will only include the results obtained on the basis of sample data.

The most general form of the model with panel data is represented by the following regression model:

$$y_{it} = \alpha_i + \beta^{'} x_{it} + \varepsilon_{it}$$

where x_{it} includes K regressors. α_i represents an individual effect, which is specific for each specific i-unit and is constant in time t. Having regard to the structure of α_i, various estimation techniques exist. If α_i is the same for all units, the ordinary least squares method (OLS) is an effective estimator. This panel estimating simply combines cross-sectional data and time series and estimates them using the least squares method. If α_i is specific for each individual i-unit and is constant in time t, we refer to a fixed effect model, which is estimated by using the least square dummy variable method (LSDV). When we assume that α_i is random for each i-unit and constant in time t, an alternative method of estimating is a random effect model. In our sample the last method produces the best results in terms of adjusting the regression line to the actual data.

The model derived on the basis of theoretical findings can be expressed as follows:

$$MB\_TURNOVER_{it} = \beta_0 + \beta_1 AIFS_{i,t-1} + \beta_2 STATE\_FUNDS_{i,t-1} + \beta_3 COMPANIES_{i,t-1} +$$
$$+ \beta_4 OTHER_{i,t-1} + \beta_5 SALES_{i,t-1} + \beta_6 \Delta SALES_{it} + \beta_7 TENURE_{it} + \beta_8 YEAR2000$$
$$+ \beta_9 YEAR2001 + \beta_{10} YEAR2002 + v_{it} \tag{1}$$

In equation (1) indexes *i* and *j* represent a company and the year of observation, the variable MB_TURNOVER denotes the share of management turnover in regard to the number of total board members in the current year, the variable AIFS measures the ownership share of authorized investment funds in companies in the previous years, STATE_FUNDS[4] measures the share of state funds ownership, COMPANIES measures the ownership share of domestic and foreign legal entities, and OTHER measures the ownership share of other owners, mainly the state, banks or small stockholders. The OTHER variable does not include the ownership share of internal owners (employees and retirees) that represent the basis for comparison, included in regression constant, i.e., a base group of companies. The SALES variable measures the rate of sales growth in the previous year, and the ΔSALES variable measures the

---

[4] Pursuant to the Privatization of Companies Act, external owners entered companies in the form of state funds and authorized investment funds. Although due to nature of ownership creation, we could join both groups into one, it is our opinion that they differ in the management of the owner's key role. While the state funds are under the indirect control of state bodies, authorized investment funds are private companies.

change in the rate of sales growth between the current and previous value[5], TENURE measures the average tenure of a management board member, while YEAR 2000, YEAR 2001 and YEAR 2002 represent dummy variables that reflect the movement of average values of the dependent variable in the studied period. υ_{it} represents the error.

Based on the model we tested the following hypotheses based on the model:

Hypothesis 1– the influence of ownership structure on management turnover:
Companies in which external owners (authorized investment funds, state funds, companies and others) had a larger ownership share, ceteris paribus, on average did not replace more management board members than companies with internal ownership. ($\beta_1 = \beta_2 = \beta_3 = 0$)

Hypothesis 2 – the influence of performance on management turnover:
Companies in which sales growth in the previous year was lower and/or sales decreased, on average replaced more management board members than those in which the sales growth did not decrease or those in which the sales growth in the previous year was higher, ceteris paribus. ($\beta_4 < 0$ and/or $\beta_5 < 0$)

Hypothesis 3 – the influence of tenure on management turnover:
In companies where the tenure of management board members is longer, the rate of replacement is on average
a) higher ($\beta_6 > 0$);
b) lower ($\beta_6 < 0$);
c) equal ($\beta_6 = 0$);
ceteris paribus.

Based on the dependent variable's variability we can conclude that there are two groups in our sample that statistically differ between each other in how the independent variables in the model affect management turnover. Since we wish to test this hypothesis, we upgraded the model by forming two groups of companies, based on the rate of return index[6]: successful and less successful companies. Model (2) can therefore be presented in the following form:

$$MB\_TURNOVER_{it} = \rho_0 + \rho_1 AIFS_{i,t-1} + \rho_2 STATE\_FUNDS_{i,t-1} + \rho_3 COMPANIES_{i,t-1} +$$
$$+ \rho_4 OTHER_{i,t-1} + \rho_5 AIFS * SUCCESSFUL\_C_{i,t-1} + \rho_6 STATE\_FUNDS * SUCCESSFUL\_C_{i,t-1} +$$
$$+ \rho_7 COMPANIES * SUCCESSFUL\_C_{i,t-1} + \rho_8 OTHER_{i,t-1} * SUCCESSFUL\_C + \rho_9 SALES_{i,t-1} +$$

---

[5] Level of sales growth in our equation explains the influence of good performance on management turnover. According to the previous analysis, compared to financial indexes this index is most successful in explaining variability in the dependent variable, i.e., the share of management turnover.

[6] Separating companies into two groups has to be performed based on a variable that is not correlated with explanatory variables in the main evaluation equation. Based on additional statistical analyses we have determined that among all variables measuring company performance, the return on assets fulfills this requirement.

$$+ \rho_{10}\Delta SALES_{it} + \rho_{11}SALES * SUCCESSFUL\_C_{i,t-1} + \rho_{12}\Delta SALES * SUCCESSFUL\_C_{it} +$$
$$+ \rho_{13}TENURE_{it} + \rho_{14}TENURE_{it} * SUCCESSFUL\_C + \rho_{15}YEAR200 + \rho_{16}YEAR2001 +$$
$$+ \rho_{17}YEAR2002 + v_{it} \qquad (2)$$

SUCCESSFUL_P represents a dummy variable, the value of which is 1 if return on assets is above the average value of all companies, and 0 if return on assets is below the average. The presented specification allows us to test the influence of independent variables in both groups of companies, in addition to differences in the average value of management turnover in the sample companies. The following hypotheses will be tested based on the model:

Hypothesis 1a:
In successful companies where external owners (authorized investment funds, state funds, companies and others) had a larger ownership share, ceteris paribus, on average did not replace more management board members than companies with internal ownership. ($\rho_1 + \rho_4 = \rho_2 + \rho_5 = \rho_3 + \rho_6 = 0$)

Hypothesis 1b:

Less successful companies where external owners (authorized investment funds, state funds, companies and others) had a larger ownership share, ceteris paribus, on average did not have higher management turnover than companies with internal ownership. ($\rho_1 > 0$ and/or $\rho_2 > 0$ and/or $\rho_3 > 0$)

Hypothesis 2a:
Successful companies that in the previous year experienced lower sales growth or the change in the rate of sales growth was lower, on average replaced more management board members than companies within the same group with a higher rate of sales growth or higher change in the rate of sales growth, ceteris paribus.. ($\rho_7 + \rho_9 < 0$ and/or $\rho_8 + \rho_{10} < 0$)

Hypothesis 2b:
Less successful companies that in the previous year experienced lower sales growth or lower change in sales growth, on average replaced more management board members than companies within the same group with a higher rate or change in the rate of sales growth, ceteris paribus. $\rho_7 < 0$ and/or $\rho_8 < 0$

Hypothesis 3a:
In successful companies where the tenure of management board members in a company is longer, the rate of management turnover is on average equal than in other companies in other companies within the same group, ceteris paribus. ($\rho_{11} + \rho_{12} = 0$)

Hypothesis 3b:

In less successful companies where the tenure of management board members in a company is longer, the rate of management turnover is on average higher than in other companies within the same group, ceteris paribus. ($\rho_{11} > 0$)

4. CHARACTERISTICS OF SLOVENIAN MANAGEMENT BOARD MEMBERS

Before we present the results of regression analysis let us shortly describe the characteristics of Slovenian managers. Slovenian companies on average have two board members, in addition to the board president. The share of management board members turnover for the 1998–2002 period was on average 20 percent. This percentage is higher than the percentage of replaced

management board members in Germany and lower than the percentage of replaced management board members in the Czech Republic. Franks and Mayer (2001) showed on the sample of 75 German companies between 1989 and 1994 that the share of replaced management board members was 11.2 percent. Claessens and Djankov (1999) showed on the sample of 706 Czech companies between 1993 and 1997 that the turnover percentage in companies in private ownership was 35.6 percent and 42.1 percent in state-owned companies. As presented in Table 1, a management board member is on average 47.7 years old, has been in his position approximately nine years and have the tenure of almost 15 years. The share of management turnover increased significantly after 2000, causes for which can be found in the change of ownership structure, the replacement of the so called old boys who came into their positions during r after the ownership process was completed. In addition, the four-year mandate of management boards that took their positions in 1996 (after the completed process of ownership transformation) expired in 2000.

Table 1: Level and characteristics of management turnover in Slovenia in the 1998–2002 period

YEAR	TURNOVER LEVEL	NUMBER OF YEARS IN POSITION	TENURE	AGE	TURNOVER OF ENTIRE MANAGEMENT	THE SIZE OF MANAGEMENT
1998	**14.8[7]****	10.0	15.7	48.2	2.6	1.9
	(7.9)[8]	(7.8)	(9.2)	(7.1)	(15.9)	(1.6)

Note: **Differences are significant at 5% (variance analysis with Duncan's method).
Source: ISEE research (2003) and own calculations.

In analyzing management turnover we can distinguish between the forced and unforced replacement. The following reasons are considered in forced replacement: disappointing performance results, the board's dissatisfaction with a board member and other reasons. In the 1998–2002 period, 43 percent of all board members were replaced in Slovenia due to forced

reasons. This share is higher than in other developed countries, where approximately 30 percent of managers are replaced due to forced reasons. As can be seen in Figure 1, there are various reasons for management turnover during the studied period. The largest share of forced replacements occurred in 1998 (out of 14.8 percent of all replaced board members, 8.2 percent were replaced due to their companies' disappointing results). The number of board members who leave their position due to retirement or changing positions has been rising since 2000. In 2001 there was an above-average increase in the share of replacements due to other reasons (literature considers replacement of managers for other reasons as forced replacement).

5. RESULTS

We continue by presenting the results of the regression analysis. Based on the estimates of regression coefficients presented in Tables 2 and 3[9] we can conclude that on average in period t significant turnovers did not occur in companies where external owners had a larger ownership share in period (t-1), *ceteris paribus*, which confirms the correctness of hypothesis 1. This effect is not statistically significant even for companies with lower performance results, which indicates that we can reject hypothesis 1b. Less successful companies with a higher share of external ownership on average did not replace more managers compared to the companies with a higher share of internal owners, *ceteris paribus*. On the other hand, a positive effect on management turnover is present in case of a larger share of other external owners in successful

companies, which is surprising. This means that the **number of replaced managers in successful companies in case of a larger ownership share held by "other owners"**, in which **the state was the largest owner**, is on average higher than in companies from the same group with a larger share of internal owners, *ceteris paribus*.

As expected, performance had a negative impact on the share of replaced managers. In the companies where sales growth was lower than expected, a larger number of managers was replaced compared to companies in which sales growth was better than expected (column 2 in Table 3). This means that we can confirm hypothesis 2. Our forecasts can also be confirmed in both groups of companies. In both groups the variability in performance statistically significantly explained the variability in the number of turnovers (hypothesis 2a and 2b are confirmed).

---

[9] Table 2 presents the assessments of regression coefficients obtained based on specification (3) and calculated by using formulas presented in the methodology part.

The variable that measures the manager's average **tenure in a company, statistically insignificantly explains the number of replaced managers in the entire sample** (hypothesis 3 is rejected). The mentioned connection in both groups of companies becomes even more insignificant. We can therefore confirm hypothesis 3a and reject hypothesis 3b.

6. CONCLUSIONS

Our analysis of management turnover covers the period between 1998 and 2002, when Slovenian companies executed their privatization programs and became owned mainly by employees and former employees as internal owners and state funds, authorized investment firms, and domestic

and foreign companies as external owners. In some companies the state has retained the ownership share that it had before privatization, while in some it was present through the Development Fund.[10] During this period the main owners consolidated their ownership shares, often by colluding, which was characterized mainly by block trading. This was typical for state funds and authorized investment firms, which in this way concentrated their ownership share in selected companies. "Their" companies often acted as acquirers of other companies. On the other hand, internal owners (employees, managers) followed their interests, which differed according to whether a company was successful or less successful (Prašnikar and Gregorič, 2002). In the former ones they emphasized their ownership role while in the latter they acted as rent-seeking shareholders (employeeism). Companies restructured strategically, especially the export-oriented ones, which were forced into the restructuring by competition (Domadenik, Prašnikar and Svejnar, 2006; Prašnikar et al., 2003).

Management turnover is present as a corporate governance mechanism; however, to a limited extent. In less successful companies the management is replaced sooner. There are no significant differences between external and internal owners in terms of management turnover and nobody is established as a more active owner. The turnover is likely to happen when dominant owners agree on it. The turnover occurs sooner if sales growth decreases. Financial

---

[10] Established in 1991 to facilitate faster restructuring of companies.

indexes are less important in the decision making. Tenure in a company does not play a major role. It is important to mention that larger management turnovers in more successful companies are connected with the larger state's ownership share. The Development Fund was mainly responsible for these turnovers.

Despite the results achieved by Slovenian companies, it is not likely that the described method of governance can be sustainable in the long run.

1. INTRODUCTION

During the past two decades Croatia has gone through radical political, economic and social change. These changes have also strongly affected value systems, among them particularly ethical values. As many new ethical questions occur, companies are becoming increasingly aware of the importance of their ethical behavior and their social responsibility.

The purpose of this paper is to examine the ethics and social responsibility as dimensions of a company's quality as a whole. University experience has a long-term impact on the development of students' values and business universities are educating future business leaders. Therefore, the paper also presents the results of a study performed among tourism business students and shows their understanding of academic integrity and ethical behavior.

2. ETHICS, SOCIAL RESPONSIBILITY AND QUALITY – ARE THEY RELATED?

Quality can be defined in various ways, but all definitions agree that 'quality is something good'. Quality is a complex concept, consisting of several criteria, elements and dimensions, depending on the concept, object, phenomenon or activity that a particular quality refers to. Defining the quality of something or somebody implies getting well acquainted with that something or somebody prior to outlining all the quality elements that form the quality cluster or its total quality.

Society is an extremely complex system that encompasses many subsystems and social phenomena (culture, politics, education, business, etc.) and defining its quality is a very

challenging task. A corporation can be viewed as one of society's subsystem whose quality ultimately determines the quality of the society in which it operates.

According to Ulrich (1970) corporations are dynamic, purpose and goal-oriented, autonomous, productive, open, social systems, placed in a complex, dynamic environment. To begin with – corporations are open systems: they interact with their environment and take part in exchange processes that are of either material or information nature. Corporations are social systems since they are a part of human society as a whole for whom they perform different functions, and on the other side as a group of people they represent a 'society' as themselves. While acting as social systems, corporations do not have a purpose of their own and can survive only if performing different functions for other systems (Ulrich, 1970). In order to enable such functioning persons in charge of management should consider carefully their environment and recognize in it purposes for their corporations. Those purposes are actually *expectation inputs* for the corporation.

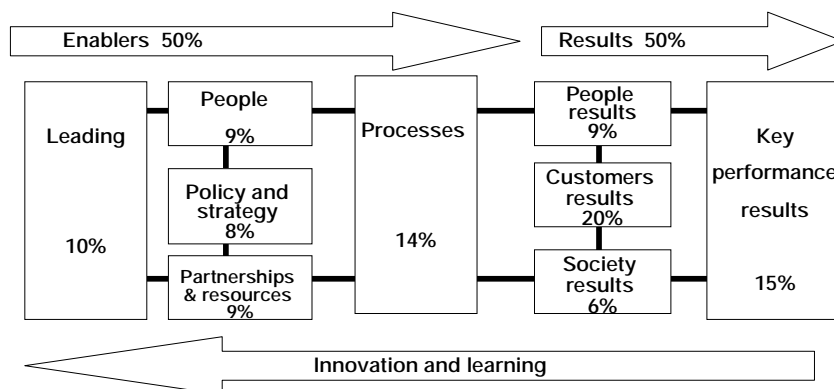
The European Foundation for Quality Management (EFQM) provides a model of business excellence that clearly shows that business performance should be evaluated with reference not only to profit but also to the community. For instance, 6% of the total points accounts for 'social results' i.e. social responsibility.


Figure 1.   *EFQM Business Excellence Model* (EFQM, 1999)

A view that business has only one social responsibility and that is to maximize the profits of its owners has long been abandoned. Companies are required to balance their social power with social responsibility and act as a kind of social institution. "Carrol (1979) suggests that corporate social responsibility is defined as the economic, legal, ethical and discretionary demands that society places on business. Similarly, Zanies conceptualized corporate social responsibility as a degree of 'fit' between *society's expectations of business* and *the ethics of business*." (Balabanis G., Phillips H.C., Lyall, J., 1998)

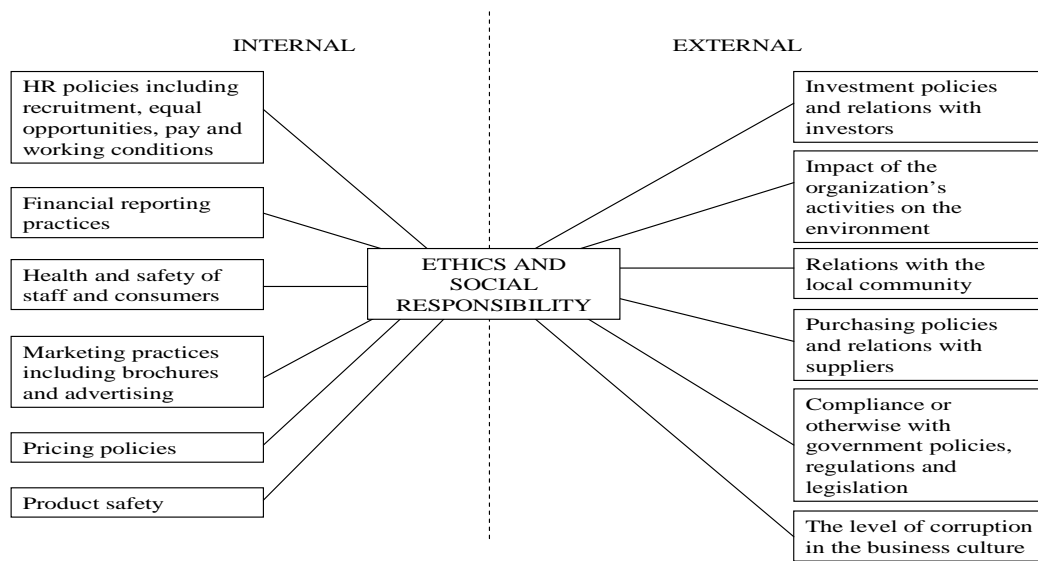
Aspects of social responsibility and ethics are best illustrated by the following figure.


Figure 2. *Aspects of ethics and social responsibility* (Horner, Swarbrooke, 1996)

Although ethics and social responsibility are closely related, one should clearly differentiate between them. According to Epstein (1987) business ethics refers to issues and dilemmas related to the morality of organizational actions or decisions. Corporate social responsibility focuses more on the consequences of organizational actions (Balabanis G., Philips H.C., Lyall, J., 1998).

3. TOURISM AND ETHICS

Tourism is an important social phenomenon, exerting great influence on society. The number of tourist today is nearing one billion, as every sixth inhabitant of the globe is classified as a tourist, and together they are often referred to as 'the traveling humanity'. Ethics in tourism influences the overall quality of a society.

Ethics is a component of quality to be attained only within the long-term perspective, in accordance with the principles of the total quality management system. The short-term goal of 'profit at any cost' carries the risk of low quality, which can result in company failure and finally in unemployment. The training of tourism managers focuses mainly on economics and foreign languages and lacks focus on morality and ethics. "Ethics is, after all, a branch of moral philosophy, and knowledge of moral philosophy is hardly on any manager's list of critical business competencies. Thus, when managers find themselves in an ethical dilemma, they turn to what they know best – financial figures, performance data, customer counts, occupancy rates, labor costs, and so forth." (Hall, 1992) However, honesty should be an integral part of the manager's personality, something taken for granted, and should be reflected both in his day-to-day decisions and in his behavior not only towards his employees and business partners, but also towards his family and society as a whole (Avelini, 2006). Ethics does not limit the opportunities for profit in tourism – quite opposite: ethics and profit are compatible.

The Global Code of Ethics for Tourism (WTO, 1999) provides a frame for deploying ethics in all tourism-related activities. The Code consists of ten principles and rules for work and

behavior of all tourism stakeholders: Tourism's contribution to mutual understanding and respect between peoples and societies; Tourism as a vehicle for individual and collective fulfillment; Tourism, a factor of sustainable development; Tourism, a user of the cultural heritage of mankind and contributor to its enhancement; Tourism, a beneficial activity for host countries and communities; Obligations of stakeholders in tourism development; Right to tourism; Liberty of tourism movements; Right of the workers and entrepreneurs in the tourism industry; Implementation of the principles of the Global Code of Ethics for Tourism

4. BUSINESS EDUCATION AND ETHICS

Education and business have grown increasingly close during the past two decades. It has been realized that there is a convergence of interest between them and the links have become more frequent displaying a depth of commitment.

University experience has a long-term impact on the development of students' values (Allen et al., 2005) and business schools are training future business leaders. That's why the issues of ethics and ethical perceptions of business students ought to get more attention. Both organizational culture of business studies and university professors and instructors significantly influence business students' perceptions of the importance of ethical values. Business educators have a responsibility to contribute in any way they can to the ethical development of their students.

However, students' values do not develop exclusively through education – they are partly inherent from other experiences and early development. Educational institutions cannot accomplish the mission alone. Experiences of student prior to enrolment are strong determinants of the value systems they will hold and apply over their lifetimes. Education serves to reinforce existing positive values and encourage their application. Early education experiences and family influences are going to have the most critical impacts on the integrity of future business leaders and their willingness and ability to be value driven (Bishop, 1992, in: Farnsworth, Kleiner, 2003).

To address emerging ethical problems and promote ethical behavior in business, many universities are requiring their students to take a course in ethics or are requiring that ethics be included as a part of business courses. A business ethics course that is required of all business schools sends a powerful message: a top priority at this school is for all students to know and follow generally accepted rules of business (Farnsworth, Kleiner, 2003).

The goal of ethics courses in business ought not to explicitly seek behavioral changes in students. Rather, they should seek to assist students in the development of those insights, skills and perspectives that set the stage for a life of personal moral responsibility, manifesting careful and serious moral reflection (Poytner, Thomas, 1994).

4.1. Methodology

The purpose of this paper was to determine students' understanding and attitudes towards academic ethical behavior. Of special interest were also discrepancies between their understanding of ethical behavior an their actual behavior. The university student population has become used to seeing unethical behavior on the part of many role models, and

academicians also feel that students, and business students in particular, no longer show a disinclination toward cheating and academic dishonesty (Kidwell, 2001, in: Peppas, Diskin, 2001).

The sample and instrument
The sample used in this study consisted of students (both two and four years study programs) in a large public Faculty in Croatia that educates students for tourism and hospitality management. A total of 661 usable responses were obtained.

The survey instrument included a demographic information section and a section consisting of questions determining understanding of ethical behavior and students' actual behavior.
The demographic section gathered information on sex, previous education, year of study and whether respondents are familiar with University's Codes of Ethics.

Data collection procedures
The questionnaires were distributed during the last week of November 2005 to all students at randomly selected lectures at each year of study. Of the total 2.952 students, 661 students completed the questionnaire, representing a 22% response rate.

4.2. Data Analysis

The analysis was conducted using SPSS for Windows, version 11.0.

Of the 661 respondents 461 (69.7%) were female and 200 (30.3%) male students. 56% of students have previously finished four-year secondary school; 33.9% a grammar school; and 9.8%, a three-year secondary school.

Table 1 shows the structure of students based on their year of study.

Table 1. Structure of students in the sample regarding year of study

Year of study	Number of students	Structure (in %)
First	304	46
Second	133	20.1
Third	132	20
Forth	90	13.6
No answer	2	0.3
Total:	661	100

The degree of familiarity with the contents of University's Codes of Ethics is rather low – only 40.4% of students are aware of its existence and content.

When asked whether they consider themselves to be an ethical person, as many as 90% of students answered positive.

In the following part of the questionnaire the most widespread (un)ethical behaviors were described and students were asked to classify them either as ethical or unethical. The following table shows the results.

Table 2. Students' understanding of ethical and unethical behaviors

Do you consider the following behaviors to be ethical?	YES (%)	NO (%)	Missing value (%)
Cribbing from fellow student (CRIB)	35.9	62.9	1.2
Use of non-allowed materials (e.g. books, notes, …) during the exam (MAT)	39.0	59.6	1.4
Prompting during the exam (PRO)	50.2	48.6	1.2
Use of mobile phones during the exam (MOB)	19.2	79.4	1.4
Copying of books and articles without publishers'/ authors' permission (COP)	52.5	46.1	1.4
Plagiarizing – using of other persons' papers (e.g. seminars, presentations) as own (PL1)	14.4	84.4	1.2
Plagiarizing – using of bibliographic units (e.g. books, articles, web sources,…) without stating the source (PL2)	32.4	65.4	2.3

Students were than asked to rate how often they practice each of the previously mentioned types of behavior. The results were somewhat disappointing and are shown in the table 3.

Table 3. Frequency of students' unethical actions (in %)

How often do you…*	Never	Rarely	Occasionally	Often	Always
CRIB	9.7	35.6	37.5	11.5	5.4
MAT	12.1	27.7	39.0	14.5	6.4
PRO	8.8	24.1	36.3	20.3	10.1
MOB	79.4	10.6	4.8	2.9	1.4
COP	13.6	12.9	21.5	31.2	20.6
PL1	83.8	9.8	3.8	0.8	1.4
PL2	41.5	30.0	17.5	8.2	2.3

(*) descriptions of variables (behaviors) are given in the table 2

In spite of the fact that they consider themselves to be ethical, only a very small percent of students has never committed any of the described unethical actions. The positive exceptions are 'using a mobile phone' and both kinds of plagiarizing.

One of the reasons that led to these results is definitely the fact that unethical actions are not sanctioned. Students also realize this: they claim that unethical behavior is not sanctioned at all (27.5%) or not sanctioned enough (34.2%). At the same time they believe that more rigorously enforced sanctions would not lead to a decrease in the frequencies of unethical behavior – only 53.6% believe that this would help.

Although unethical behaviors are practiced very often, only 29.5% were caught in the very act. Surprisingly, most of them did not bear any consequences (39.6%) or were only personally (10.3%) or publicly (10%) warned. Only 5.5% of them were temporarily expelled from the education process (exam, lectures,…).

While being extremely uncritical towards themselves, students are very critical towards their fellow students. Only 12.1% of students consider *all their colleagues to be ethical* while others believe that *some of their colleagues are unethical* (54.6%) or that *most of their colleagues are unethical* (26.6%) i.e. that *all of them are unethical* (3.5%).

Distorted understanding of severity and consequences of unethical behavior are also reflected in the fact that even 90.5% of students would **not** report the unethical fellow student.

Since the problem of copying from books and articles without permission was recognized as especially numerous and severe (only 13.6% of students never copied unauthorized and 51.8% of them do it either *often* or *always*) students were offered answers as to why do they behave in unethical way. Multiple answers were allowed.

Table 4. Reasons behind unauthorized copying of learning materials (books, articles, …)

Statement: I copy the books/articles because…	% of students
… they are not available to buy.	31.2
… I cannot afford to buy them.	52.6
… I cannot lend them from the library.	30.6
… I am not used to buying them.	12.6
… except for passing the exam they are useless.	31.8

Gender differences.

93% of women as opposite to 85% of men consider themselves to be ethical. This self assessment was corroborated through questions regarding existence and frequencies of unethical behaviors. The percentage of men and women who answered that they have never committed the described unethical actions is shown in the following figure.
Figure 3. Comparison of female and male students who never act unethically (descriptions of variables i.e. behavior are given in the table 2)

Given that male and female students receive similar educations it would be reasonable to expect that their perception of ethical behavior would be similar. However, research does not support this presumption. Gender studies suggest that women are more ethical than men (Allen et al., 2005).

Previous education did not cause any significant differences regarding unethical behavior.

Year of study.

If we observe the year of study as a determinant of an increased degree of students' maturity and, in the same context, the students' behavior as a consequence of their exposure to university's (and its members') high ethical values, the condition can be seen as positive.
Figure 4. Comparison of first and fourth year students who never act unethically (descriptions of variables i.e. behavior are given in the table 2)

Namely, the differences between first year and forth year students and their (un)ethical behavior have proven to be significant. Unethical behavior is occurring less frequently in higher study years. Figure 4 shows the comparison between the first and fourth (last) year of study program and the percentage of students who *never* act unethical.

5. CONCLUSION

Both ethics and social responsibility play a major role in the future economic development and business culture in Croatia. Society's opinion regarding corporations is becoming more and more critical. Every corporation's negative activity is judged critically by the public.

The presence of a code of ethics does not make people and students moral. With or without the presence of a code of ethics, one needs to ask oneself whether actions being taken are lawful, moral and in line with one's character and personal codes. Lectures, discussion groups, seminars can however help change and improve students' ethical sensitivity and morality.

Universities must take a critical look at their role in the ethical development of future business leaders and assume a leadership role in addressing society's concerns for conscientious business decision-making and actions (Farnsworth, Kleiner, 2003).

Due to a strict legislation and the concept of corporate social responsibility, since late 1980s, the environmental "issues" of packaging have been treated as a significant part of contemporary strategies in all relevant industries worldwide. Striving to adjust its legislation to positive EU standards, Croatia recently introduced new environmental laws. One of the laws - the Regulation on packaging and packaging waste, introduced in 2005 attracted significant media coverage and certain resistance among some key stakeholders within related industries. The abovementioned law introduced a set of environmental protection fees and a deposit for containers for beverages and liquid diary products, along with the implementation of a new national collecting and recycling system. Nevertheless, the new legislation increased costs and opened the "Pandora's box" of ethical issues related to the subsequent price increases. Although the law itself has been used as a justification for increased retail prices, all related industries, except the beer industry, were opposed to the implementation of the law. They perceived it as an unnecessary obstacle in price-sensitive B2C environment.
The purpose of this paper is to analyze Croatian experience(s) and influence of the environmental laws to both - the economic effects and the social responsibility of related industries.

Key words: *packaging, environment, beer industry, Croatia*

1. PACKAGING AND ENVIRONMENT – NEW EMERGING CONCEPT(S) OF PACKAGING

The key role(s) of modern packaging: product protection; marketing communication; operational/handling convenience (see: Prandergast & Pitt, 1996; Taylor, 2004; Ampuero & Vily, 2006) are reversibly derived from various impacts related to consumers/end users, producers, processors, bottlers, marketers, supply chain intermediaries, etc. But, the

abovementioned is often analyzed only through "virgin" concept of packaging – without complicated follow-up environmental/recycling procedures and practices. In addition, packaging is often considered as "unwanted" waste after the product is once used. Although the "business aspects" of related environmental issues have been in the research focus since 1960s (Daisley, 1963), until late 1970s the research activities were provided/sponsored mostly by various environment-protection organizations/NGOs worldwide (e. g. Greenpeace). Since late 1970s, the packaging environmental issues could be considered as some of the very important mainstream research topics in the fields of: product development; supply chains/distribution channels and corporate social responsibility (Anderson & Brodin, 2005). Within the European Union (EU), the environmental issues related to packaging were regulated by the European Community (EC) packaging directive accepted in 1994 (Rundth, 2005). The purpose of the directive was to minimize the negative impact of packaging on the environment by recovery, recycling or by the utilization of returnable packaging. Various studies indicated that the usage of returnable packaging results with lower energy consumption and the preservation of precious natural resources (Selke, 1994). The EC directive has stipulated precise quotas for the recycling and recovery of particular packaging materials for all the member countries. It seems that EU industry showed high level of positive awareness for the "new" environmental legislation (Prendergast, 1995). However, in spite of the increasing legal and social pressures related to packaging (through package reduction, recycling or reuse), there are less researches oriented towards sales/marketing issues related to environmental aspects of packaging (Prendergast & Pitt, 1996).

Contemporary social responsibility ideas/concepts/initiatives (developed mostly within local communities), eventually, resulted with environmentally responsible B2C consumers. Through last few decades, many consumers were interested in issues related to their role in environment protection. Therefore, one of the important components of their buying decision-making process is the (perceived) interdependence of environment protection and their decisions regarding packaging of the products they purchase and use (Laroche, Bergeron & Barbaro-Forleo, 2001). Immediately, some marketers detected opportunities transformed in specific market niches or possibilities for market (re)positioning. D'Soutza (2004) analyzed how the growing *green consumerism* has made manufacturers and marketers aware of the possible use of *green* attributes as a marketing tool in standard STP (segmenting, targeting & positioning) process. Recent researches indicate increasing number of consumers willing to pay more for environmentally friendly products (Laroche, Bergeron & Barbaro-Forleo, 2001). This resulted with the environmentally friendly type of packaging/packaging materials that are, nowadays, relatively important diversification attributes for marketing communications aimed at the environmentally conscience consumer. Furthermore, the consumer's role has changed due to recycling, giving the households more active role of physical suppliers for the recycling industry/facilities (Anderson and Brodin, 2005). Therefore, consumers could be treated as an important component (link) within the classical supply chain – due to a fact that the classic concept of B2C "end users" is now challenged with the existence of additional subjects that provide recycling/reusing services (playing the role of new "end users").

Environmental consciousness requires/should be based upon sufficient level of information regarding the specific issue(s). Unfortunately, producers and consumers do not necessary express the same level of interest and involvement regarding the product packaging issues since their ethical sensitivity, values, (industry) norms and perceived consequences differ (Bone & Corey, 2000). In other words - different objectives lead to different behaviour.

It can be concluded that environmental impact of packaging became significant concern for governments, businesses and consumers – creating the new set of key stakeholders and processes.

2. ENVIRONMENTAL LAWS AND PACKAGING IN CROATIA: MARKETING CHALLENGES

2.1. Recent historical context

Institutionalized/official collection of few types of materials and their recycling, in limited form, existed in Croatia since 1950s with organized collection of metals, paper, glass, and other materials (Buljan, 1986). It was result of initiatives started up by several state-owned companies reprocessing collected materials. With the exception of primary and secondary education system, there were no systematic and permanent activities conducted in order to educate and stimulate general population to perceive recycling as important and useful social activity. However, significant proportion of glass and metal containers for food and beverage products was reused in households for various purposes (such as: preserving home-made food, wine, brandy; planting flowers and vegetables, etc.). By the late 1980s, first containers for the collection of used glass appeared, but the whole system collapsed in 1991 when more-less intensive war clashes (1991-1995) took place in Croatia and (later) in Bosnia and Herzegovina.

The activities resumed in the mid 1990s with the introduction of new environmental laws. One of the first legal acts referred to the packaging waste was the *Regulation on packaging waste treatment* (1996) which was introduced in order to reduce the packaging waste. According to the Regulation, the industry (e.g. bottlers, importers, etc.) became responsible for the collection of packaging waste. They were also supposed to install vast number of recycling containers in the retail outlets and public area, and provide recycling and recovery of collected waste. This provided a legislative framework and the industry was supposed to determine the details of the recycling system. The Regulation also introduced mandatory penalties for those who will not comply with the new rules. Unfortunately, it was mostly ignored by the industry and was even mistreated by the government itself (!), so it failed to achieve the expected goals.

Because of the problems related to implementation of relevant legislation, some partial solutions were introduced as substitute(s) of proper national system. Since the mid 1990s the separate collection of packaging waste in Croatia was organised on more-less voluntarily basis. This "back-up" system was based on a network of poorly dispersed recycling containers managed by the municipal companies. The distribution of recycling containers depended on the wealth of the local communities which resulted with better coverage in more developed urban areas while less developed and rural areas were neglected. Beside traditionally present glass and paper recycling facilities, collection of PET (polyethylene terephthalate) initiated development of rudimental PET recycling activities but also resulted with a significant export of non-processed PET waste to China. Since there was no nationwide recycling initiative introduced, recycling rates were (and still are) bellow EU requirements. According to experts representing packaging industry, the recycling rates in 2005 were at 19% for glass and approximately at 5% for PET while the recycling rate of multilayer (carton) packaging is negligible.

2.2 Croatian reflections on environmental laws

As part of a harmonization of the legal system with the EU, Croatia recently introduced a number of environmental laws based on European Community (EC) directive 94/62/EC and its amendments 2004/12/EC and 2005/20/EC. After the initial failure in the 1990s, the situation dramatically changed with the introduction of the new Regulations on packaging and packaging waste (2005) which set up a new packaging recycling and recovery deposit system managed by the specialized government agency. Although the introduction of new Regulations was planned for October 1, 2005, due to many negative reactions from the relevant industries and professional associations, the implementation was postponed until December 1, 2005.

Simultaneously, industry (i.e. mostly bottlers and few importers) formed an association called EKO-OZRA[1] with the intention to stop or further delay the introduction of the Regulations with the implementation of a new industry managed recycling and recovery system based on some positive foreign experiences. However, this initiative was launched too late and it was not realistic and effective, compared with the government sponsored Regulations anchored within the positive legislation.

The newly introduced deposit system ia based upon a system consisting of environmental fees and deposits - stimulating the use of returnable packaging with the setting of specific returnable packaging quotas for different product categories (Regulations on the packaging and packaging waste, 2005). The system of environmental fees is relatively complicated and is designed for specific packaging material, container capacity and the achievement of the national returnable packaging quota. The new system is dealing with solely beverage and diary packaging with the capacity above 20 cl. The other product categories are not covered yet. The Regulations is also making slight difference in taxation among different packaging materials (e.g. glass, PET, other plastic materials, metal). There is a recovery fee which is calculated by the weight of material and quantity. There is also a return deposit which is determined at HRK 0,50 (approx. EUR 0,07) per piece of empty packaging. From the consumers' point of view, this is the deposit that will be returned/refunded when the piece of packaging is returned to the retail outlet or to other licensed collector. This deposit is mandatory for almost all packaging materials used for beverages and diary products. There is also a stimulating fee which is determined by the packaging material and the packaging capacity. The abovementioned fees and the deposit are combined together to calculate the total environmental fee or tax for a particular beverage or diary product produced in Croatia or legally imported to Croatia.

However, the implementation of such environmental laws within EU also hasn't been smooth at the very beginning - e.g. in the UK (Fernie and Hart, 2001) and Germany (Livingstone and Sparks, 1994) but the initial problems are now solved. Although the most of EU industry showed high level of awareness in favour/for the environmental legislation (Prendergast, 1995), some relevant industries in Croatia were not ready to support the newly introduced system. The industry seems to be afraid of potential cost of recycling and recovery system although they could use positive benchmarks from the neighbouring Slovenia where industry made a consensus with the government. In 2002 the government and industry established

---

[1] See: www.eko-ozra.hr.

national recovery organization - Slopak, which is dedicated to the achievement of goals set up by EU environmental directives and is doing well (Milijevic, 2005).

2.3. The new Regulations and consumers: A case of misinterpretation?

Within the EU, with the rise in environmental concerns, most firms are responding with strategic environmental marketing activities designed to meet the growing demand for environmentally friendly processes, products and packaging (Pujari and Wright, 1996). Unfortunately, Croatia seems to be still quite far away from this concept. First of all, consumers should be properly informed/educated about the environmental impact of packaging when it became waste. The introduction of the new Regulations was, with no doubt, quite an opportunity for the Croatian government to start an educational program for Croatian consumers in order to change public environmental consciousness and improve the acceptance of the new deposit system. However, the whole educational and informational role has been passed to the mass media journalists. The new deposit system became a front side story for many Croatian magazines, newspapers and TV stations. However, letting the journalists to educate consumers and interpret the new Regulations wasn't exactly the best option. Despite public appearances and statements of environmental minister and ministry secretaries, there had been a vast number of misleading information present in the mass media. The misunderstanding of the new Regulations was obvious. Some of the media reported that the new Regulations was mostly referring the plastic packaging (e.g. Rak Sajn and Moskaljov, 2006), while others announced that glass packaging is not included in the deposit system at all (e.g. Gataric and Rak Sajn, 2006). There had been also misinformation about the new markings on the packaging claiming how there should be special labels on the packaging containers (e.g. RTL Vijesti, 2005). Some journalists stressed the social component of the new Regulations and presented it like an income opportunity for poorer segments of population (e.g. Martinic, 2006). The environmental message lacks completely. It is quite unclear why the government and especially the Ministry of Environmental Protection, Physical Planning and Construction did not organise a public campaign in order to present the new environmental legislation to broader public.This, however, is decreasing the potential of marketing implications for the industry since the consumers are not very familiar with the real benefits and goals of the new recycling system.

2.4. New environmental legislation and related marketing implications

Despite the lack of educational campaign that will explain to the consumers the real meaning of the new recycling system, packaging in Croatia never had been so much in the point of interest by both companies and consumers. Recent poll by a research agency Promocija plus indicated that the new deposit system came into the focus of most consumers during the first couple of months of its existence (Infoarena, 2006). So, the consumers showed their interest in the new deposit system. But, what happened with the bottlers, companies affected with new environmental taxes. Among the EU countries environmental issues were recognised in mid 90s and integrated into the business strategy (Pujari and Wright, 1996). However, it seems that a majority of Croatian companies haven't been prepared for the new situation. Instead of preparation for the new deposit system and packaging waste collection, it seems that companies and business associations were more concerned with the criticism and price increase announcements as reflection to the environmental taxes (e.g. Mrvos-Pavic, 2006; Hrnjkas and Petrovcic, 2006; Buksa, 2006).

However, breweries are supporting the new Regulations since they are already using around 80% of returnable glass packaging and are not obligated to pay additional environmental taxes (Ivezic, 2006). They were, actually, the only part of the bottling industry that accepted the new Regulations but were not successful in persuading companies from other branches of industry.

Lack of serious communication program (marketing communications) directed by the government caused a serious confusion within both the mass media and consumers. However, it also resulted in a growing interest in the environmental issues. Some companies included messages connected with the recent changes in environmental laws and the introduction of the new recycling system within their marketing communications campaigns. Their unique selling proposition (USP) stressed extra profits for end consumers resulting from changing their behavioural pattern toward "environmentally friendly" behaviour (i.e. switching to returnable packaging). Among others, the biggest national retail chain[2] positioned itself as a collection point for the used packaging, despite its opposition to the new Regulations at the beginning.

With adequate educational efforts, government could have achieved spill-over effects by introducing and stimulating environmentally friendly behaviour in all relevant industries and population clusters. Thus, multiplicative effects could have increased overall acceptance of environmentally friendly behavioural patterns.

In the case of Croatian beer industry this could be used as an additional motivator since the overall behaviour of beer consumers seems to be more environmentally conscious than in the case of other beverages. Nevertheless, this could raise some social consideration since beer is in its essence an alcoholic beverage but the model itself could be implemented within other branches of beverage industry where returnable packaging is having very low ratio (e.g. soft drinks).

3. PACKAGING AND RELATED "ENVIRONMENTAL" REGULATIONS: THE CASE OF CROATIAN BEER INDUSTRY

3.1. Beer industry – in brief(s)

Although there are several small, family owned breweries, Croatian beer industry consists of seven main producers[3]. The first four breweries together generate 91.5% of total market. Therefore, the industry could be treated as an oligopoly (Harfindahl-Hirschmann's index = 3.053)[4]. The Croatian beer market generates more than 60% of sales through retail channel and the rest through hotels, restaurants and cafés. Only 1.5% of sales is generated under the private labels. The rivalry among competitors is intensive (Gnjidić, 2004).

3.2. Beer packaging - in brief(s)

The Croatian beer industry could be considered as relatively undifferentiated by packaging. There are two categories of *standard* packaging (market share: approx. 95%):

1. Returnable:
- glass bottles (0.5 l and 0.33 l)
- barrels (50 l and 30 l)
2. Non-returnable:
- cans (0.5 l and 0.33 l)
- PET bottles (2 l; 1.5 l and 1 l)
- glass bottles (0.33 l and 0.25 l)

---

[6] N.B. Figures for the I-XII were not yet available.

Non-standard (special) packaging is relatively rare (approx. less than 5% of total market):

1. Returnable:
- glass bottles (0.66 l; 0.5 l and 0.35 l)
2. Non-returnable:
- cans (0.5 l and 0.25 l)
- glass bottles (0.66 l and 0.25 l)

Relative shares of specific packaging in distribution channels are presented in Table 5.

Table 5. Average beer consumption in Croatia by packaging type and distribution channel

Pack type	Retail (share - %)	HORECA (share - %)	TOTAL (share - %)
Glass	73.3	82.4	74.8
PET	17.5	-	11.9
Can	9.2	0.4	6.5
Draft	-	17.2	6.8
TOTAL	100.0	100.0	100.0

Source: AC Nielsen (retail and HORECA panel research 2005-2006).

Table 6. Standard packaging type shares and prices per litre by packaging type and distribution channel (average in 2005 – 2006)

	Retail		HORECA		TOTAL
Packaging type	**Share (%)**	**Price (HRK/l)**	**Share (%)**	**Price (HRK/l)**	**Pack. type share (%)**
I. Returnable packaging					
Glass 0,5 l	69.4	10.20	52.1	20.50	62.9
Glass 0,33 l	1.1	17.40	19.8	36.60	8.1
Barrels 30 and 50 l	0.0	-	17.2	22.80	6.4
TOTAL	**70.5**	**-**	**89.1**	**-**	**77.4**
II. Non-returnable pack.

3.3. New "environmental" regulations

Regulations on packaging and packaging waste were introduced in 2005 and the producers were obliged to pay following fees:
- *disposal fee* (to cover the waste disposal costs)
- *returning fee* (0.5 Kn for liquid products packed in containers 0.2 l + - in order to motivate end users to return the packaging for recycling purposes – the fee is refunded after the product is sold through distribution channels),
- *motivation fee* (introduced for producers which do not achieve following percentages of returnable packaging in their total output (percentage per specific year): 2005 (55%); 2006 (65%); 2007 (70%); 2008 (75%); 2011 (80%); 2012 (85%); 2013 (90%).

The disposal fee is used by governmental *Fund for waste disposal* and is not refundable. It is calculated as a part of production costs. As a result, the retail prices of beer packed in non-returnable glass bottles, PET and tins were "flatly" increased – in order to cover the additional costs. The industry experts market predicted that the end users will change their habits and buy more products packaged in returnable packaging (with no negative effects on total quantities sold).

Table 7. Comparative analysis of packaging type shares and price per litre by distribution channel in 2005 and 2006

	Retail				HORECA				TOTAL (Pack. type share -%)	
	2005		2006		2005		2006		2005	2006

Source: AC Nielsen (retail and HORECA panel research 2005-2006).

The resulting changes were obvious and significant (Table 7):

- average prices of beer in returnable packaging sold through retail channel were increased by 10.4%,
- average prices of beer in non-returnable packaging sold through retail channel were increased by 8.49%,
- average prices of beer in returnable packaging sold through hotels, restaurants and cafes (HORECA) were increased by 4.23%,
- average prices of beer in non-returnable packaging sold through HORECA were increased by 1.96%.

The similarities regarding increasing of prices in both distribution channels are obvious. The new "environmental" regulations directly caused the higher level of retail prices of beer (price increase = 2.1%).

The differences in sales of products in returnable and non-returnable packaging (see Table 7) resulted only with "re-structuring" of end-users demand. Therefore, the new "environmental" regulations caused the higher level of retail prices, but there are no evidences of decreased demand for beer in non-returnable packaging. In addition, the sales of beer packed in returnable packaging were not decreased as some experts predicted.

In general, the end-users (consumers) reacted positively on newly introduced regulations – they did not significantly change their buying behaviour! This could be interpreted as a clear signal to industry – every fair/unbiased (flat) regulation that is social acceptable is not supposed to cause turbulent market changes and could be treated as a marketing strategy "placebo" effect for every producer that already achieved certain sustainable competitive advantage.

4. CONCLUSION (OR INSTEAD OF IT)

Although there are no doubts about the positive general attitude towards the contemporary corporate social responsibility issues related to packaging within the context of recycling and recovery, industry could be concerned about possible cost inefficiency caused by strict environmental regulations. The abovementioned could not be denied, but the example of Croatian beer industry indicates that newly introduced "environmental regulations", in most cases, could not be blamed for negative changes related to buying behaviour, sales structure and profitability – in general. In addition, in marketing terms, the implementation of socially responsible environmental regulations could generate positive perception of the industry and all relevant stakeholders involved in the process (although it is difficult to measure such effects). At the same time, although the retail price level was increased, according to presented evidences, it is obvious that the newly established (higher) price "equilibrium" had not caused structural changes in relative market shares or any relevant aspect of buying behaviour at the national B2C market. Therefore, the environmental issues and policies could be planned and implemented in industry-government partnership(s) and socially responsible businesses could use them as a source of sustainable competitive advantage. False excuses for market(ing) failures are no longer welcome!

1. INTRODUCTION

The original philosophical basis of marketing described as the "marketing concept" or "marketing orientation" (MO) has been based on the principle that the best way for a business to achieve high performance (profit) is through satisfying consumer needs (customer/market orientation) and the emphasis on an integrated marketing strategy. (e.g., Bartels 1976; Canning 1988; Hunt 1976a; Hunt 1976b; Kotler 2002; McGee and Spiro 1988; Narver and Slater 1990; Shapiro 1988; Webster 1988). This value based directive, first indirectly mentioned by Shaw (1929), but more directly stated by the General Electric Corporation (1952) and Mcittrick (1957), has became an integral part of almost all marketing management texts as well as an essential precept forming the ideological basis of marketing education. Although the philosophy has been subject to empirical evaluation and there exists some evidence in support, it is, nonetheless, not clear that the prescription always leads to beneficial outcomes (Dunn, Norburn, and Birley 1994; Ellis 2005; Hooley et al. 2003; Jaworski and Kohli 1993; Kohli and Jaworski 1990; Narver and Slater 1990). The conceptual structure is poorly specified and imprecise for uncritical acceptance and implementation. For example, the precept of the pursuit of "consumer need satisfaction" breaks down with deleterious, perhaps illegal products such as drugs. Granted this situation, further conceptual and

empirical research becomes of imperative importance particularly for developing nations, which are, in some cases, uncritically implementing western marketing practices. It is our purpose to contribute to this endeavor by providing exploratory evidence concerning the effects of executive MO, organizational structure, size and age on performance in the developing economy of Croatia.

2. CONCEPTUAL DEVELOPMENT

While the transformation of the former command economic systems may be viewed as a part of the inevitable entropy or a steady deterioration of a systems or societies, the change was drastic and accompanied by, in some cases, extreme economic distress. The problems originated from conflict, war, and the necessary for the radical change of the system and social structure. Even in stable circumstances, with a leadership imbued with goodwill, the problems were exacerbated by a deficiency of knowledge and precedent for the radical change (Crnjak-Karanović, Pecotich, and Renko 2005; Koves and Marer 1991; Marer and Zecchini 1991; Pecotich, Renko, and Shultz 1994; Pecotich and Shultz 2006a; Pecotich and Shultz 1998; Shultz and Pecotich 1997). Faced with the necessity for reform, and fully aware of the deficiencies of their previous systems as well as being flooded with Western propaganda, it was inevitable that the leadership should turn to the market system and the associated theories as a source of inspiration for change. As a consequence the major thrust of the transformation focussed on the market as well as education in Western business theory and applied implementation.

This dual movement towards a market-based economy and business education had related implications. The privatization of industry, a necessity for the market system, foreshadowed the need for MO and a new educated management for its strategic implementation. In its primary form privatization involves a transfer of ownership of assets from some form of state controlled collective ownership to a smaller group who represent private interests, so transforming a public enterprise into a private one. The asserted economic benefits brought about by this transformation, however, are predicated on common beliefs that are more grounded in ideological faith then in evidence (e.g., Anonymous 1998; Baldwin 1987; Bozeman 1987; Byrnes, Grosskopf, and Hayes 1986; Converse 2000; Crew and Camathe 2003; Hossain and Malbon 1998; Institute for Southern Studies 2000; Megginson and Netter 2001; Prizzia 2003; Simon 1995; Van De Walle 1989; Van Horn 1991; Vickers and Yarrow 1988). Advocates of privatization argue that the privatization of state-owned enterprises will improve economic efficiency because of greater competition and ownership responsibility.

The industry within these now developing economies consists of state-owned enterprises, private owned foreign enterprises, and privately owned enterprises, in a competitive environment. Many of the state enterprises still keep the pre-reform moribund management structure or are operating rudderless while awaiting a political decision to be made about their future. The privatised corporations are likely to be led by a market driven, educated new management that understands and is attempting to apply innovative management concepts. It is, therefore, expected that state owned enterprises are less likely to adopt the Western marketing philosophy (see Figure 1, for the structure).

 With regard to MO the evidence suggests there is a positive relationship between that variable and corporate performance (Dunn, Norburn, and Birley 1994; Ellis 2005; Hooley et

al. 2003; Jaworski and Kohli 1993; Kohli and Jaworski 1990; Lloyd and Nigel 1999; Narver and Slater 1990; Shun-Ching and Arthur Cheng-Hsui 1998), but the support is strongest among mature companies in well developed economies (Ellis 2005, p., 630) although this may also be true in developing economies (Akimova 2000; Ellis 2005; Hooley et al. 2003; Pecotich and Shultz 2006b; Shengliang and Dart 1999; Shun-Ching and Arthur Cheng-Hsui 1998; Xiaohua and Richard 2003; Zaharieva, Matthew, and John 2004). This evidence for the developing economies has deficiencies in the measurement and design, the evidence, therefore is not strong. Given the philosophical imperative in marketing and the nature of the existing support it is reasonable to postulate a positive relationship between MO and corporate performance (see Figure 1).

Two additional variables that have implications for this study are organizational size and age. Essentially the theoretical positions on these two variables are in conflict (Gooding and Wagner 1985; Greve 1999; Ranger-Moore 1997). One position suggests that size and longevity are indicants of success because the organization has survived and grown. The advantages of size are many and include such factors: resource availability, greater competitive strength, more control over their operating environment and political influence. Age has similar advantages as there is an inherent "liability for newness" and inexperience (Ranger-Moore 1997). New organizations must create structures involving costly learning and other set up costs. The theorists embracing the other point of view base their arguments on the point that growth and aging processes increase organizational inertia. It is postulated that as organizations age and grow they are less like to react to environmental change due to bureau-cratization and other time-dependent processes. Despite considerable research it has not been possible to find definitive support for either point of view (Gooding and Wagner 1985; Greve 1999; Ranger-Moore 1997). In developing our exploratory conceptual structure we have decided to separate the two variables. Size is a stronger clearer indicator of corporate success and power, and we therefore postulate that it will have positive association with MO and performance. Older organizations are more likely to be imbued with inertia and so fall victim to obsolescence and senescence we, therefore postulate negative associations (see Figure 1).

3. METHOD

3.1. Sample

The study was conducted in Croatia - a central European nation that is undergoing economic development but has a turbulent recent transitional history. The sample was drawn from the top 1000 Croatian Corporations as published by the "Privedni Vjesnik". The direct mail approach procedure was used to collect the data from key informants, that is from senior managers who have the best vantage point for viewing the entire organization and, thus, are able to provide the most accurate responses. Instructions ensured the respondents understood the purpose of the study and the assurance of confidentiality. Of the 1000 questionnaires mailed 197 substantially completed questionnaires were received giving a response rate of 19.7 percent which was considered satisfactory (Dillman 2000; Dillman 1978; Dillman et al. 1974; Groves 1989; Kotha, Rajgopal, and Rindova 2001). All the respondents held high-level executive positions within their corporations of which, 34% were foreign/private, 39% domestic/private and 27% were state owned. The sample emanated from a wide variety of industries (43 percent were involved with consumer products, 31 percent with industrial products, 19

percent with business customers and 20 percent with services) thus representation was acceptable.

3.2. Procedures and Measures

The data was collected using self-administered questionnaires that were based on the MO measures as developed by Jaworski and Kohli (Jaworski and Kohli 1993; Kohli and Jaworski 1990), and extensively used and validated in marketing (Ellis 2005). The instrument was translated into Croatian and back-translated into English to ensure accuracy of translation and pre-tested as recommended by Brislin (1986). The respondents were asked to complete a set of items on five point scales as per Jaworski and Kohli (1993). The four elements of the scale were found to have a satisfactory factor structure as postulated by Jaworski and Kohli (1993) and coefficient alphas of .76, .80, .69, and .76. As financial reporting conventions varied, it was decided to collect conceptual measures of performance. Essentially the respondents were asked to indicate on five point scales how well they had performed within their industry. They were also ask to report the nature of their performance over the last three years, again on five points scales ranging from much worse to much better and also to indicate their market share for the immediately preceding three years. Size was measure by two variables i.e., *asset value* and *number of employees*. Age was simply computed by subtracting the date of establishment from the present year (2006). Finally, the state/private dimension was measured by a simple proportion of ownership with the state proportion at the high end. The measures were consistent with those previously used in these kinds of studies (Dess and Robinson 1984; Ellis 2005; Jaworski and Kohli 1993).

4. ANALYSES AND RESULTS

Our initial analytical processes involved the plotting of data, transformation and the evaluation of the nature missing values (Anderson 2001; Neter, Wasserman, and Kutner 1990; Tabachnick and Fidell 1989). We found no indication that the missing values in our study were related to any variable of substantive interest. Nonetheless, the sample size was reduced to 139 due to the intersection of the missing data (Little and Rubin 1987; Schafer 1997; Schafer and Graham 2002). The size variables were found to be highly skewed and were therefore transformed to natural logs as recommended (Neter, Wasserman, and Kutner 1990). Also to allow for the possibility that the performance and size metrics were impure it was necessary to evaluate and control the nature of the relationship. This was achieved by running a series of regressions of size on the performance measures and using the resulting residuals for further analysis (Neter, Wasserman, and Kutner 1990). There was no significant difference in the results suggesting that there existed sufficient discrimination between the measures and an analysis with either set of variables was acceptable.

To test theoretical propositions we used the partial least squares (PLS) estimation procedure (Chin 1998; Fornell and Cha 1994; Lohmoeller 1989; Wold 1981). PLS is a general technique for estimating path models involving latent constructs indirectly observed by multiple indicators. It was developed by Wold (1981) to avoid the necessity of large sample sizes and 'hard' assumptions of normality. It was, therefore, considered particularly suitable in this study as our aims are largely exploratory. A PLS model consists of two sets of linear

relations: the outer model involving the latent and the manifest variables; and the inner model where the hypothesized relationships between the latent variables are specified. A major advantage of PLS is that the outer model formulation explicitly allows for the specification of both reflective and formative modes as well as categorical variables. Reflective indicators are formed in the classic test theory factor analytic model. The formative indicators, however, are not assumed to measure the same construct nor are they assumed to be correlated. Rather they are an optimum linear combination forming the latent construct. We expressed all measures as reflective indicators in which case the factor analytic model applies. The revised PLS computer program (Chin and Fry 2003) was used to evaluate systematically the properties of the outer and the inner model as expressed in Figure 1.

Evaluation of complex models involves a logical examination of several fit indices to establish the predictive relevance (Lohmoeller 1989). The results in relation to the outer measurement model were all found to be satisfactory with the exception of the Market share measures. These were, surprisingly, found not to load on the performance measures and, as no significant relationships were found, to lack predictive validity so were dropped from further analyses. For the latent variables the bootstrap critical ratios (Chin 1998) are acceptable (greater than 1.96) for all variables. The Average Variance Extracted (AVE) (Chin 1998; Fornell and Cha 1994) were high (above .53) and the combined reliabilities were satisfactory (above .69). The postulated negative association between relationship *State/private* and *MO* was supported (Figure 1) - the standardized regression coefficient was significant (β = -.21, p < .05). The relationships between age and size, and MO were found not to be significant. The mean proportion of variance explained (AVA), the R^2 for the endogenous variables MO was found to be 0.10 which was acceptable, suggesting that the effect size may be of applied importance. The relationship between *MO* and *performance* was found to be significant (β = .32, p < .05) and in the postulated direction as were the links between *performance*, and *age* (β = -.19, p < .05) *and size* (β = .27, p < .05) of *enterprises*. The R^2 was in this case .25 which was higher than the recommended minimum of .10 suggesting the effect size may be of sufficient magnitude to be of further interest (Falk and Miller 1992). In examining the latent variable correlations and the cross-residuals matrix omitted relationships of substantive size were found so indicating that explanatory additions to the model were not necessary

5. DISCUSSION AND CONCLUSION

In this study we sought to evaluate the impact of Western (US) philosophical ideas on the performance of organisations within the developing, transforming nation of Croatia. We based our conceptual arguments on classic economic theories of the market, and the exhortations of marketing scholars to adopt the marketing philosophy which is postulated to lead to corporate success. In this context the prescription is to privatise and adopt the MO that is expected to lead to higher performance. It was asserted that Croatia a developing nation that is emerging from a state controlled economic system and moving to a market structure was particularly suitable for such a test. We operationalised and tested the propositions shown in Figure 1 using data based on responses to self-administered questionnaires from 139 Croatian executives. Our data supported the existence of a negative relationship between *state/private* organisations and *MO* and the positive association of *MO* to *performance*. We also found, as expected, a negative direct relationship between enterprise *age* and *performance* as well as a positive relationship between *size* and *performance*.

Our results, therefore, tend to support the marketing imperative concerning the implementation of marketing principles and practices. This is consistent with previous research (Akimova 2000; Ellis 2005; Hooley et al. 2003; Jaworski and Kohli 1993; Xiaohua and Richard 2003; Zaharieva, Matthew, and John 2004), but provides more formalised evidence in a developing economy. A promising finding was that size and performance metrics may be sufficiently discriminatory to justify their use as independent variables. Also supported were the postulated inertia effects due to age and the advantages of size. The effect sizes were in the mid-range suggesting a promising basis for further exploration.

The failure of the *market share* variables is surprising but may be due to possibilities that merit further investigation. Market shares may change slowly in comparison to perceptual measures and longer term perhaps longitudinal studies may be necessary to reveal its effects. A more serious possibility is that the market share non-results are caused by deficient or inaccurate knowledge. The large number of missing values tends to support this view. As market shares have concrete referents, unlike much of the other data which is based on personal perceptions, this has implications for our results and future research. Market share is an important variable of major strategic relevance; its inaccurate knowledge may have major impact on performance. In conclusion, we must caution against unconditional acceptance of the results of this study. Further research in different contexts with varying methodologies is needed before strong conclusions can be made. However, our research does provide a promising basis for the future.

1. INTRODUCTION

This paper offers a conjecture: in some cases minority shareholders willingly accept expropriation by majority shareholders, considering it to be a form of remuneration of *social capital* put at the disposal of the firm by the majority shareholders. Social capital, discussed more precisely in the next section, is understood here to be the goodwill resulting from privileged relationships of the majority shareholders and which can be used to procure tangible economic benefits for the firm. For instance, if the majority shareholder arranged through his or her personal influence for the firm to have an exclusive import license, then we consider this to be an investment of social capital, entitling the majority shareholder to economic benefits from the firm in excess of those stemming from ownership rights. We propose to dub such excess remuneration *social dividend*. We also introduce related concepts of *social depreciation*, *social assets*, *social liabilities* and *social equity*.

All around the world business groups associate minority investors in parts of their empires. Sometimes this is done through a public company, affording minority investors liquidity associated with the stock market, and -- at least theoretically -- increased protection of their rights through government oversight. But many ventures are private, with far less protection of minority rights. Frequently the "majority owners" in fact have only minority economic interest, either through dual-class shares with differing voting rights or when they invest in the company through a pyramid scheme in which at each stage to maintain control they only have to own a little more than 50% of shares (Amit and Villalonga, 2006; Anderson and Reeb, 2003; Bebchuk, Kraakman and Triantis, 2000; Berle and Means, 1932; Daily and Dalton, 1992; Demsetz and Lehn, 1985; Fama and Jensen, 1983; Shleifer and Vishny, 1986; Wolfenzon, 1999).

This paper focuses on the case where the majority shareholder is an individual or a family, which is the case in many developed and developing countries (La Porta et al., 1999). True, many large public companies with a diffused ownership structure, such as Total or France Telecom, have publicly listed part-subsidiaries, and many of the arguments in this paper apply to them as well. But family firms offer a clearer case, and concentrating on them sharpens the focus.

It is often argued that the classical agency problem to align owners and managers in a firm (Jensen and Meckling, 1976) does not apply to family firms as their governance structures often combine ownership and management. Instead, scholars argue that family firms face a different type of agency problem, which is the possible conflict of interest between different groups of shareholders (Chrisman et al., 2004; Morck and Yeung, 2003). In family companies the non-family investor faces an important question: is the business managed to maximize the wealth of all investors or is some of its performance sacrificed to the benefit of the family? Because the family controls management, it has a myriad of opportunities to expropriate the company: overpaying purchases, under-pricing sales, nepotism, and other practices known collectively as "tunneling" (e.g., Bae, Barclay and Holderness, 1989; Bertrand, Mehta and Mullainathan, 2002; Friedman, Johnson and Mitton, 2003; Kang and Jin-Mo, 2002; Johnson et al., 2000; Ming and Wong, 2003). Such private benefits are described by Coffee (2001) as "all of the ways in which those in control of a corporation can siphon off benefits to themselves that are not shared with the other shareholders." Modern auditing and oversight methods are designed to prevent such practices. But countries have imperfect institutional environments and barriers to expropriation are fairly fragile. Such expropriation is common in transitional economies in general (e.g., Claessens, Djankov and Lang, 2000; Dharawadkar, George and Brandes, 2000; Firth, Fund and Rui, 2006; Johnson *et al,.* 2000; La Porta et al, 1999; Leuz, Nanda and Wysocki, 2003; Lemmon and Lins, 2003; Mitton 2002), and in Asian economies in particular, such as Korea (Chang and Hong, 2000; Chang 2003), Taiwan (Yeh, Lee and Woidtke, 2001), India (Bertrand et al., 2002), China (Ming and Wong, 2003) and Hong Kong (Cheng, Rau and Stouraitis, 2006). But European countries as well are known to experience this phenomenon; for instance Belgium (Buysschaert, Deloof and Jegers, 2002), Germany (Ehrhardt and Nowak, 2001; Franks and Mayer, 2001; Gugler and Yurtoglu, 2002), Bulgaria (Atanasov et al., 2006) and Spain (Miguel, Pindado and de la Torre, 2005). In France expropriations of minority shareholders by business tycoons Pinault (e.g., Roche, 2003) and Arnault (e.g., Routier, 2003) have been well documented. In some countries such as Sweden (Doukas, Holmén and Travlos, 2002) or the United States (Anderson and Reeb, 2003) tougher market regulations make tunneling harder to detect, maybe indeed less prevalent. Yet family controlled companies frequently are a popular choice of the investing public (Miller and Breton-Miller, 2005), which seems to accept some degree of expropriation. This is puzzling, especially in an open global investment market with plentiful options to invest in companies without diffused ownership.

The ideas presented here emerged from the sense-making phase of an extensive case study of the strategic evolution of the Salim Group, founded in the late thirties by a proverbial "barefooted" immigrant from China, some sixty years later representing in turnover five percent of Indonesia's GDP, with over 200 000 employees and hundreds of companies (Carney, Dieleman and Sachs, 2006; Dieleman 2006; Dieleman and Sachs, 2006a, 2006b; Sato, 1993; Soetriyono, 1989; Twang, 1998; Weidenbaum and Hughes, 1996). The spectacular success of the Group is largely attributed to the very close corrupt relationship between the owning family and Suharto, Indonesia's dictator for thirty-two years, but also to

the family's extensive network of ethnic-Chinese connections. The family had many partners, always retaining controlling rights, and several of its more prominent companies were publicly listed on various Asian stock exchanges. Accounting and reporting practices were far below the standards of dominant international markets, and the Group was not known for being overly committed to transparency. It was widely assumed in Indonesia that the Group played all kinds of cat and mouse games with its minority shareholders although pinning down irrefutable evidence is a difficult, if not a hazardous task. It appeared obvious to us that many minority shareholders accepted a priori that they will not be getting their fair share of the fruit from their investments.

We conjectured that this acquiescence resulted from the acceptance that the Salim family was entitled to be remunerated for "lending" their connections to their individual companies, and that it needed the economic means to maintain and further develop their network of relationships. Furthermore, it became clear to us that this modus operandi was necessary in the institutional environment of Indonesia. We thought that a somewhat formalized concept of social capital and the derivative one of social dividend are well suited to describe these conditions. Together with theories of conglomeration and of institutional development, they provide a theoretical framework to explain the phenomenon.

The next two sections offer a possible explanation using the concept of "social capital," which is the set of privileged relationship of the family that it employs to the benefit of the company, expecting in return to be remunerated as it would be for a pecuniary investment. An adaptation of accounting concepts is then proposed to identify ways in which social capital can be remunerated.

2. THE CONCEPT OF SOCIAL CAPITAL

The concept of "social capital" arose as the response of sociologists to the economic concept of "human capital." The latter was formulated as a way of broadening the classical model of an economic entity, in which (financial) capital and labor are used to transform inputs into outputs (e.g., Leontief, 1973). The idea is to not treat labor as an undifferentiated commodity, but rather to recognize that education and skills are a source of wealth, frequently far more important than money (Mincer, 1958; Becker, 1964).

Sociologists expanded on this concept by pointing out that "human capital" accounts only for intrinsic qualities of human beings – and by extension of social entities – such as education and skills. But social entities also have extrinsic qualities by deriving positional benefits from relationships. They can call on social networks for support and solidarity, or just to gain access to scarce resources, and they contribute in turn to other members of the network. Thus social capital is as "real" as human capital or just capital (e.g., Bourdieu 1985; Coleman 1988; Fligstein, 1997; Lin 2001; Putnam 2000; Uzzi, 1997; Woolcock, 1998).

Since its inception the concept of social capital proved to be very fertile, used in a myriad of fields of inquiry (Dasgupta and Serageldin, 2000; Knack and Keefer, 1997). It is generally viewed as a "good thing" as when development experts argue that it can help in rendering poor communities more resilient or when students of transitional dynamics in post-communist countries see it as a key element in fostering democracy and other modern institutions. Theories of the firm also use the concept to advance their understanding of the role of culture and group cohesion in producing desirable outcomes such as client orientation or innovation (e.g., Adler and Kwon, 2002; Nahapiet and Ghoshal, 1998; Uzzi, 1997). This paper proposes

a more instrumental perspective, arguing that social capital of the firm or of the firm's owners – seen here as political and business relationships with powerful players – is a direct producer of significant strategic results, as when a firm benefits from a state-granted monopoly.

There is ample evidence that social capital is a key corporate success factor in countries with underdeveloped institutional environments (Blyer and Coff, 2003; Carney, Dieleman and Sachs, 2006). During the years of import-substitution industrialization the governments in developing economies promoted local companies providing them with subsidized loans, exclusive rights and tax advantages, frequently with the blessing from and participation of international institutions (e.g., Wu and Wu, 1980). Some spectacularly wealthy businesses emerged, including the Salim Group. For private entrepreneurs it was critically important to be chosen as beneficiaries of government largesse, and that depended on their relationships and willingness to remunerate corrupt officials. Many countries saw the emergence of what was dubbed "crony capitalism" (Kang, 2002).

Some authors (e.g. Adler and Kwon, 2002) distinguish between bonding and bridging forms of social capital. Bonding capital accrues to an individual by virtue of belonging to a close-knit group, such as an ethnic minority or an "old boy's network." Members of the group exhibit greater goodwill to each other than to outsiders, are bound by some kind of a code of conduct, and obligated to participate in some sort of a trading of favors. Bridging capital accrues to an individual by virtue of his or her intermediation position, establishing useful relations across boundaries that are not easily crossed. Such capital is more ephemeral than the bonding form; it requires maintenance through a continuing transaction stream and does not transfer easily to others. Both forms of social capital need to be maintained by continued investments, implying that social capital comes at a cost to the firm or its owners. In some cases the costs of social capital may exceed the benefits and its careful management is therefore required (Carney, Dieleman and Sachs, 2006)

3. THE ROLE OF SOCIAL CAPITAL

In environments with poorly developed market institutions economic transactions are difficult: the legal framework may not be able to enforce contracts, business partners may be unreliable and dishonest, financial institutions may not be able to provide the necessary support instruments, infrastructure may be deficient, regulatory bodies may not be able to ensure a level playing field, government officials may be incompetent and/or corrupt, and the political system may be unstable (e.g., Peng, 2003). It is well established that in such environments tightly knit social networks, such as army officers, school networks, families, or minority groups, have a significant advantage (Bonacich, 1973; Cook, 1977, Davis, Trebilock and Heys, 2001; Granovetter, 1992; Keister, 1999; Portes and Sensenbrenner, 1993). Contracts can be enforced by internal group bodies, such as an honor court or a religious council, or more informally by the exercise of heavy social sanctions for deviant behavior. Reliability and honesty of partners is checked through the social "grapevine," and credit can be extended among group members without much formality, and internal rules can substitute for government regulation. The bonding social capital of the group creates an environment that is more propitious for business than the context at large. In fact it becomes a necessary ingredient of business success.

Bridging social capital is also necessary. For example, when a government allocates scarce resources on other-than-market bases, it is necessary to establish bridges with the clique controlling such decisions (Frynas et al., 2006) and to arrange for some form of payment for

favorable outcomes. The natural response of a business operating in a corrupt environment is to corrupt, and this tends to create lasting relationships between members of a particular business community and members of the government circles.

Traditionally, minority groups played an important role in economic activity, as in the cases of the Jewish, the Chinese and the Indian Diasporas. Internally, they often had a higher degree of social cohesiveness than the population at large (Chirot and Reid, 1998). Their internal codes of conduct enforced through strong social pressure made up for the deficiencies of the institutional environment that rendered trust-based legally-enforceable economic transactions difficult. Externally, in a world with high political and cultural barriers to trade, they provided bridges, thanks to their dispersion (Rauch, 2001).

Some ethnic groups have elaborate systems to regulate and even account for favors traded within the group. The Jewish Talmud evolved over centuries as a set of religious rulings on fair trade (Attali, 2002). The Chinese *guanxi* system provides a fairly rigorous mode for calculating IOUs and mutual obligations (Redding, 1990; Szeto and Wright, 2006; Xin and Pearce, 1996). Hutchings and Weir (2006) draw parallels between *guanxi* and the Muslim *wasta*. Modern groups that are not defined on ethnic lines also use implicit systems regulating the trading of favors, as described by Michel Ferrary (2003) in his discussion of "gift exchange" in the Sillicon Valley venture capital scene.

Persecuted minority groups frequently play an important role in transforming their social capital into successful business ventures. Authoritarian rulers tend to prefer doing business with such minorities, since they are more vulnerable, subject to arbitrary expropriation, less likely to transform their economic wealth into competing political power, and easily blamed to canalize popular resentment. Such groups tend to have a higher degree of social cohesiveness than the population at large, and their members can call on each other, including in trans-border networks, to trade favors and mutually advance their fortunes. In institutionally undeveloped environments, where trust and enforcement of contracts are lacking, this social cohesiveness can be a significant asset.

In the Indonesian case we have seen all of these phenomena at work. The Salim family relied on their Chinese networks, both domestically and throughout South East Asia. The caste of army officers, Suharto chief among them, that exercised authoritarian control over the country, favored a select group of Chinese businessmen, lavishing on them subsidized credits, exclusive import licenses, tailored-made protectionist barriers and regulations, and other favors that translated into billions of dollars. They did so in exchange for economic benefits to themselves, their families and cronies. At the same time they maintained a climate of nationalistic hostility towards the Chinese minority, focusing on it the wrath of the population when the Asian crisis erupted in mob violence.

One puzzling element of the Salim case, and of many similar cases around the world, is why the government largesse focused so much on one group? Why did Suharto favor the Salims quite as much, and foregone diversification of his "portfolio of corrupt advantages" among a wider spectrum of cronies? We think that there is a double answer to that question. First, it is well known that diversified conglomeration is an advantageous business strategy in weak institutional settings (Carney, 2005; Hoskisson et al., 2000; Khanna and Palepu, 1997, 2000; Kock and Guillen, 2001). Controlling as much of the value chain as possible, including financial and media institutions, is a clever way of dealing with the deficiencies of the market, by substituting a tightly managed internal market for the vagaries of the economy at large.

427

Second, contrary to the wide-spread misconception that corrupt companies are incompetent Salim emerged to be one of the most respected companies in the country, not for its ethics of course, but for its efficacy. It was in the interest of Suharto to deal with competent cronies, because he derived his political legitimacy, and hence his continuing ability to stay in power and reap economic benefits from that, from the relative success of his development policy for the nation. Thus to be successful, the Salim Group had to simultaneously develop its capabilities to corrupt and to run a good business (Dieleman and Sachs, 2006a, 2006b).

Incompetence can be deadly for corruption. Consider the case in a European country of an insurance company whose executives siphoned 6 million Euros in the purchase of land for a tourist development. The scheme was to rapidly construct a resort, resell it, and have the overpayment for land "disappear" disguised as a slight reduction of the profits generated by the transaction as a whole. However, the chief executive died unexpectedly, that project got marred in lengthy delays and more graft, to be eventually exposed, leading to several arrests.

In corrupt institutionally unstable environments a business family has strong incentives not to "put all its eggs in one basket." Family groups tend to be widely dispersed, opaque and secretive, with only parts of the structure readily visible to the outside (Carney, 2005; Khanna and Palepu, 1997, 2000; Kock and Guillen, 2001). Secrecy and opaqueness are good protection against expropriation or political upheaval. Also to maintain a better control over the complex web of relationships that constitutes the family's social capital it is important to separate the various participants, and thus not to bring them together under a single corporate umbrella. Also, different cronies are entitled to different levels of remuneration, and therefore the business structure has to be "portioned out," resulting in fragmentation. Some partners, such as Multinational Corporations, provide key skills and prefer to be isolated from the ambient corruption. They tend to be associated in separate corporations, and little "funny business" takes place in such entities. Other partners are corrupt officials and the profitability of ventures with them must be assured regardless of business performance, leading to propping: the contrary of tunneling (Friedman, Johnson and Mitton, 2003). Some ventures are entered into with cronies as "repayment of past favors" or under some sort of duress, and they may not make much business sense. Only a portion of businesses have "traditional investors" that provide capital in exchange for profits.

Even in such companies the social capital motivation may not be negligible, since the family may need for its own preservation the goodwill of the investors. Thus even in public companies owned through a pyramidal scheme – the ideal vehicle for minority shareholder expropriation in economies with weak law enforcement records for corporate governance – the family must limit its appetite to preserve public goodwill. This suggests a self-regulatory mechanism that may explain why minority investors may not worry too much about being excessively expropriated.

If the company enjoys a wealth-generating advantage due to the family's social capital then it is natural that minority investors will accept that this capital be remunerated. Thus, what may appear as "expropriation of minority investors" in classical economic theory may in fact be a "legitimate remuneration of non-monetized investment" in the eyes of the minority investors. Naturally, the term "legitimate" is used here in a narrow utilitarian sense, abstracting from broader ethical considerations.

Consider a simple example. A well connected person decides to start an arbitrage company whose business success will depend on privileged access to information gleaned from the

network. The entrepreneur has no capital which is needed to buy low and hold before reselling at a higher price. He approaches a potential investor, and agrees to sell 40% of the newly created company in exchange for the capital. The transaction assigns an a priori weight of 60% to the social capital brought in by the entrepreneur. Future gains will accrue 40% to the investor and 60% to the entrepreneur. If the entrepreneur delivers on his promises, the investor is likely to be satisfied and the transaction described here is perfectly legitimate in any jurisdiction.

It is reasonable to postulate that a similar logic governs decisions of minority investors in family businesses. The key difference is that the agreement is not explicit, and that the value placed on social capital is unclear. Advanced jurisdictions frown upon such non-explicit arrangements, because of ethical standards, but also because they risk expropriating the taxman when remuneration takes place through inflated costs. Thus there is a considerable body of financial auditing practices aimed at detecting cases of confiscation and expropriation. The next section uses a simple accounting scheme to conceptualize ways in which social capital can be remunerated.

4; REMUNERATING SOCIAL CAPITAL

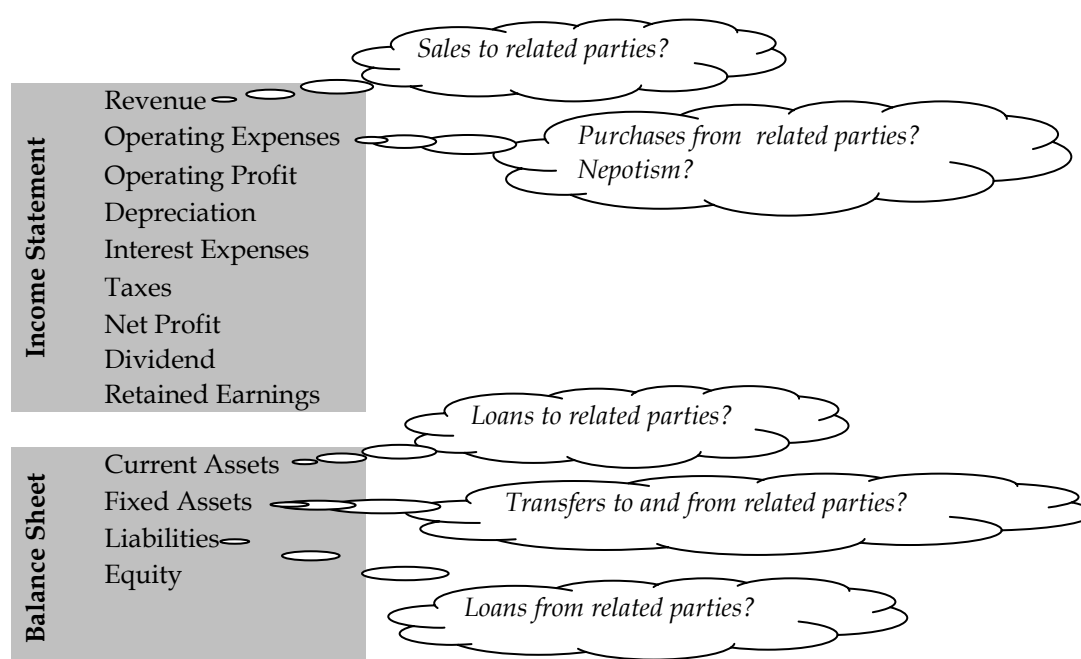
Regulatory, judicial and fiscal systems in advanced market economies are designed to force companies into maintaining transparent accounts, in particular to protect minority shareholders from asset expropriation and rent confiscation by majority owners (e.g., AICPA ,2001; Bushman and Smith, 2001; Bushman et al, 2004; FASB, 1982; Gordon and Palia, 2004; Hirst and Hopkins, 1998; Sherman and Young, 2001). Figure 1 shows a simplified version of corporate accounts annotated with the kind of questions that may be asked by an auditor looking for signs of expropriation and confiscation.


Figure 1.   Expropriation Audit.

The firm's profitability, and therefore all shareholders, including minority ones, can be hurt when products or services are sold at a cost lower than the fair market value. If such sales are made to an entity in which the controlling shareholder has an interest greater than in the focal

firm, then the possibility of confiscation arises. For example, if a family owns 60% of the seller and 80% of the buyer, then by causing the seller to under-price it transfers profits from an entity in which it would partake in only 60% of the profits to an entity where it can claim 80%. Hence the auditor's focus on sales to related parties. The same reasoning goes for purchases from related parties, where the danger is of overpaying for goods and services acquired from an entity in which the controlling shareholder has a stake greater than in the focal company. A particular form of such transaction is nepotism, paying for employment of a kin of the controlling family with a salary above fair market value.

Loans to and from related parties both follow the same kind of logic. There is the possibility of loaning money cheaply (or extending payment terms) to entities in which the controlling shareholder has a greater stake, and in borrowing expensively (or shortening payment terms). Transfers of assets to and from related parties are also a potential instrument of expropriation. They can be bought too dearly or sold too cheaply to an entity with a greater stake by the controlling shareholder.

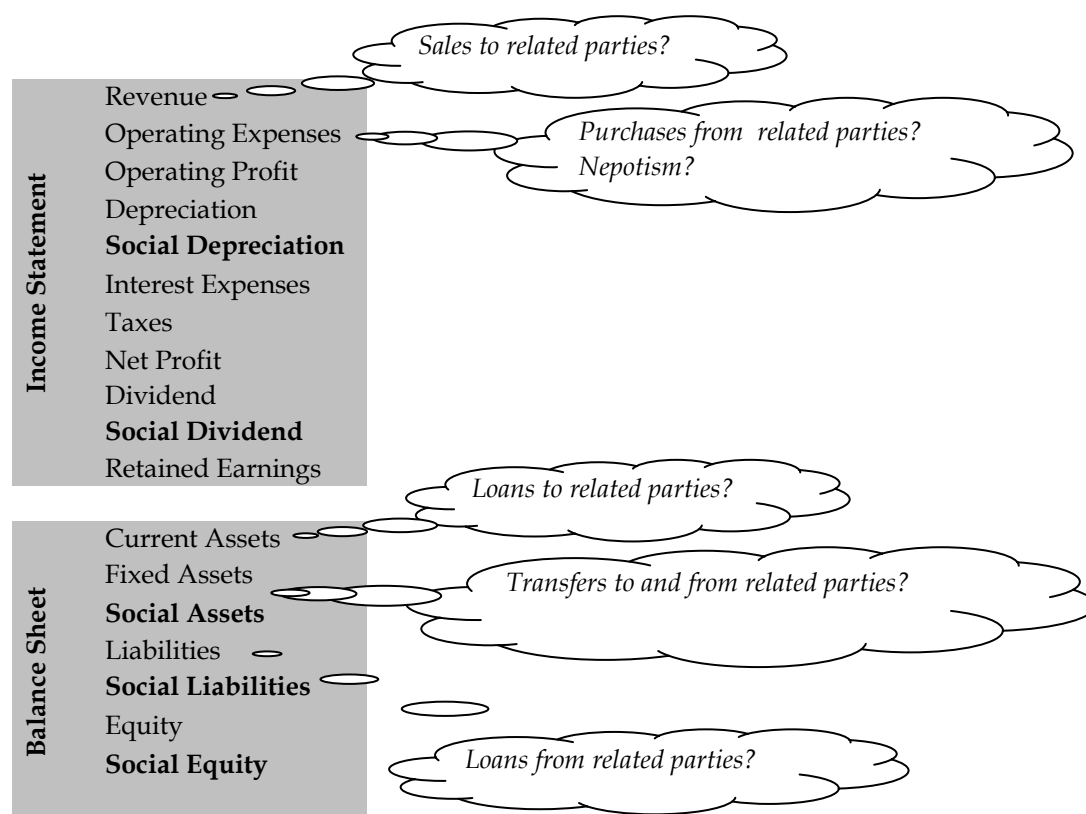
The central thesis of this paper is that in some situations what would otherwise appear as an illicit transaction aimed at confiscating rents or expropriating assets from minority shareholders may in fact be viewed by those as "legitimate" remuneration of the controlling family's social capital vested in the firm. Conceptually, this may be captured by amending Figure 1 as shown in Figure 2. Several conceptual categories, printed in bold, have been added to the company's income statement and balance sheet. They call for brief definitions.


Figure 2.   Social Capital Audit

Social assets are advantages stemming from the controlling family connections that produce benefits to the firm. An exclusive license or import barriers obtained from the government are examples of such assets. In corrupt economies such assets are generally associated with a

corresponding liability, such as remunerating the official that granted the favor. Such a liability can be assumed directly by the family, for example by setting up an unrelated business with an official's kin. In some cases, however, the liability may be assumed by the focal firm, giving thus rise to a social liability. The difference between social assets and social liabilities forms social equity: the net social capital invested by the family. Social equity entitles to a social dividend: economic benefits derived by the family above and beyond the amount based on its shareholding.

While many modern businesses treat depreciation as simply a fiscal advantage that shelters part of the income stream from taxes, originally the concept was used as a way of accounting for the costs of tear and ware of fixed assets, such as machines, creating a reserve to eventually replace them. Social assets may also have this kind of cost associated with them. In the complex web of mutual obligations that characterize social networks some social capital flows from IOUs: favors owed in exchange for past services. Such form of social capital decreases in value when used and/or with time, and therefore it is appropriate to think of a "replenishment reserve" or social depreciation.

This completes the conceptual scheme to incorporate the notion of social capital into an accounting view of the firm. The auditor's annotations in Figure 2 and those in Figure 1 are identical, looking for dealings with related parties. This is because from a purely formal point of view it is impossible to distinguish between vulgar "cheating of minority shareholders out of their due" and "paying for social capital vested in the firm." Indeed, the distinction between the two is based on knowledge that firm advantages are due to the controlling shareholder's social capital and on the assumption that the minority shareholder accepts to pay for that capital. Indeed, confiscation and expropriation on one hand, and remuneration of social capital on the other, can co-exist. Controlling shareholders may cause the firm to pay them a "legitimate" remuneration for their social capital, but also take advantage of their control to simply steal from their partners. This confirms the widely accepted notion that it is difficult to construct operational measures of social capital (e.g., Schmid, 2002).

The concept of "related party" (La Porta, Lopez-de-Silanes and Vishny, 2000; La Porta *et al.*, 2002; La Porta, Lopez-de-Silanes and Zamarripa, 2003) is crucial to the auditor's task of detecting the various forms of payment for social capital. In legal terms it is a fairly simple concept to render operational. For example, one may define a related party as an entity or a person owned in part, directly or indirectly, by an owner of the focal business or his kin; or a person related to an owner of the focal business. But even in advanced modern economies such as France a definition of this sort fails to capture favors traded among members of a group such as alumni of an elite school or members of a particular professional corporation.

In the murky waters of a corrupt economy such as Indonesia under the reign of Suharto the concept becomes even more difficult to capture. For reasons already discussed families such as the Salims have strong incentives to keep much of their business empire opaque to the outside world, owning entities through straw men or foreign holdings. A fortiori corrupt officials selling public privileges for private gain have little incentive to appear involved.

5. CONCLUDING REMARKS

In the era when Corporate Social Responsibility became fashionable, it is well worth remembering that corrupt societies lead to corrupt business practices. Many of those practices – indeed those that are most profitable – consist in cronies of power-holders arranging for

advantages that give their businesses a competitive edge. This is transforming a social capital vested in personal relationships into a business asset. Therefore, the concepts of social capital, social dividend and other related concepts, even if difficult to measure, provide a valid way in which to think about businesses in many transitional economies and beyond.

HUNDRED STRATEGIES, ONE STRATAGEM – AN INQUIRY INTO THE CROATIAN APTITUDE TO STRATEGY PRODUCTION

Key words: *Development strategy, Development policy,*
Policy makers, Policy implementation

1. DEVELOPMENT MANAGEMENT – A (PRE) TRANSITIONAL PROBLEM

Development ought to be managed. Economic and social theories have been written about it and it has long been proved that activities which are rationally undertaken by individuals ordinarily do not merge into a result that is socially rational. Equal individual efforts and adequate cooperation and coordination may accomplish more and in a better way. This is not doubted by theoreticians and certainly not by methodologists who are supposed to come up with methods for accomplishing the most socially acceptable development. Practitioners in ministries and in planning organizations, who have to ensure the said coordination one way or another, are also in no doubt.

As for transition Croatia, many will agree that almost everything that is not good, is so because it is not being managed. Further more, since there is no painless and obviously no fast transition, and since too many things go wrong, an ongoing discussion has been developed about economic and social development, about its directions and aims and even more about the means of managing it. Economists that deal with Croatian development notice that their research topic is not going well. Sociologists notice the same, let alone the environmentalists. The more difficult the situation is the fewer are those who will be satisfied with a cold analysis. Anyone, if only a bit sensitive, will try also to do something himself to improve the things he/she studies. Thus, even the academics, untouchable until recently, and the professors, who have always abhorred practice, involved in the discussion.

To enumerate the Croatian development judgements and management proposals may take some space. It is claimed, for example, that in Croatia the development is not managed and that policy measures are not well designed. It is claimed, also, that measures are probably well designed, but poorly implemented, and that there is no one to monitor their impacts. It is deduced therefrom that the part of the state administration that has to implement development policy is weaker than the part which creates it. It is claimed that break through transition can hardly be managed and that it simply has to be endured. Besides, we are knocking on the door of the European Union, which is not going to change because of us. We have no choice but study development guidelines that are coming from Bruxelles and implement them. It is claimed, also, that one should not hurry into Europe, that each knock on its door makes us lose a part of our identity, and that, therefore, the genuine Croatian way has to be found.

As for terminology, it is usually in inverse proportion to the level of analysis. The vocabulary of the documents that are well corroborated with facts, propositions, analysis and final

judgements is simple and familiar. However, the less analysis there is, the more difficult it is to produce a text. One resorts to comparisons and terminological innovations that depend on whether the subject is something favourable or unfavourable. When writing about something unfavourable, the authors resort mostly to medical terminology. "Disturbing symptoms" are noticed, the economy is in a "coma" and it needs an "injection" (financial, of course), the "sclerotic" and "vulnerable" economic system needs "shock therapy", the "seat of the illness" needs to be eliminated, and so on. The guidelines and measures required to recover and leave the hospital are described with more optimism. In doing so the role of a steersman is assumed, often even inadvertently so one easily falls into socialist industrialization and/or military terminology. Thus the "breakthroughs" that the "development locomotives" and the "production driving-wheels" will make are being determined, for which an adequate "logistics" are required in order to overcome different and, what is more, "entrenched" opinions. All of this is to be undertaken on the basis of a "strategy".

The strategy is, without any doubt, one of the best-loved topics in the discussion about Croatian development and its management. Battles have been fought over it ever since the independence of Croatia, while towards the end of the 1990s the remarks that Croatia in fact had no strategy at all and that consequently there was no development, became more and more frequent.

As for the ideology, it should not be forgotten that immediately after abandoning the socialist system and acquiring independence, Croatian politicians in charge of development discarded every idea of socialist development management. Consequently, the political requests for abandoning any planning prevailed. In the beginning of the nineties even the spatial planners, who nobody had ever associated with the calamities of socialism, were cautious not to mention planning too much. The war, which could just confirm how much realsocialism was connected with aggressive nationalism, contributed to such a viewpoint. The war legitimised also fast, straight forward decision making and this was felt not only at the front line but also in the changes to the economic system.

As for the emotions, one should observe that at transition times everything pre-transitional is regarded as odious or at least unsuitable. One needs reminding here that the request for development management was made long before the transition and even before the socialism itself. Furthermore, the request for managing economic and even social development has been made many times in the course of history and it differed from case to case and from country to country. This fact could not be blurred even by the war and anti-socialist rhetoric.

The transitional difficulties convincingly eliminated the statements that growth of the Croatian economy may be left to the unrestricted actions of entrepreneurs in the free market. The discussion about development management, strategies and action plans started as early as the beginning of the 1990s. The actors in economic policy started to refer to development documents prepared at the end of the 1980s, and the first strategy, that is the development document drafted in independent Croatia, appeared in 1991. Very quickly, almost everyone who was dealing with future in his/her ministry, public company, trade union, party, non-government organisation, and other organizations, set about drafting, and preferably enacting officially, documents that carried the title of strategy, strategic development programme, national development programme and similar. In the second half of the 1990s such an inclination (fascination, rather) with strategies became prominent.

2. TOO LONG A BIBLIOGRAPHY

Over the past fifteen-odd years, Croatian strategic documents have been written by the order of the state administration (ministries and Government agencies or committees) for public companies, for counties, municipalities and, occasionally for an NGO. They were also written without commissioning, out of the need to make a contribution or, on the other hand, to impose or at least offer it to a ministry or to the Government directly. The Government and the ministries would accept most of such documents, but they did not forward all of them into the procedure of adoption. Some of the forwarded documents were adopted by the Parliament of the Republic of Croatia, while others were not. Some of the adopted strategies were subsequently published in the National Gazette, and some were not. As regards the non commissioned, self-developed strategies, the majority of them appeared in professional and even in scientific publications that, of course, did not commit anyone to anything. In any event, this sort of literature in Croatia is neither collected nor listed by anyone.

Let us focus here on strategic development documents that deal with particular sectors of the economy or with particular social activities, pertaining to the entire area of the Republic of Croatia and commissioned by an agent of development policy that is a Croatian state administration body. Entering the discussion on the development and its management in this way means also turning to some strategies written before the independence. At the end of the 1980s one could come across development proposals that depicted the Croatian (but not the Yugoslav) economy with many entirely non-socialist characteristics such as privatisation, development of a modern market, new banking system and more. The best example of them is the development project titled Scientific Foundations of the Long-term Socio-economic Development of Croatia, which was undertaken from 1986 until the beginning of 1991. It was a huge task embarked on by a dozen of scientific-research institutions, commissioned by the then Self-Managed Interest Association for Science of Croatia and the Republic Institute for Social Planning. After five years, some 6000 pages of text were written and 22 out of 31 planned studies published. A voluminous summary titled *The Concept and Strategy of the Long-Term Socio-Economic Development of Croatia* was also produced. Neither the Parliament nor the Government has ever officially dealt with them, and consequently they were not published in the National Gazette. Upon the establishment of the Republic of Croatia the client disappeared and along with him also any obligation to translate the development proposals into action plans and measures.

However, even a cursory review reveals that *The Concept and Strategy...* were equally relevant before and after independence and the push-off into transition. Thus, in the beginning of 1991, the brand new agents of Croatian development policy had at their disposal 22 sectorial strategic documents whose subject was the economic and social development of Croatia. Policy decisions that followed did not provide any evidence that the documents of the 1980s were consulted. There is enough evidence about new strategic documents, however. By the end of 1991 three of them had been adopted:

Economic Policy Programme for the year of 1991

Medium-Term Plan of the Development of Croatian Railways, 1991 – 1995, (National Gazette 38/91)

and

Plan of Long-term Development of Post and Telecommunications in the Republic of Croatia Until the Year 2000 with the Medium-term Development Plan for the Period from 1991 – 1995, (National Gazette 51/91)

During the year 1991, the newly established company Hrvatske ceste (Croatian Roads) assessed that a long-term development document should be prepared. The document would determine the future of the public roads network in Croatia. Subsequently the

Preliminary Financial-Economic Study of the Construction of Motorways in Croatia, Zagreb, Civil Engineering Institute of Croatia, Croatian Roads, Zagreb, 1991,

was prepared in the middle of the year, followed by the

Plan of Maintenance and Development of the Public Roads Network in the Republic of Croatia for the Period from 1991 to 1995, with Basic Development Elements until the Year 2000 (National Gazette 52/91)

In this way, the discussion about development and its management officially included roads. The statement that a road inevitably means development has not to the present day been examined seriously, at least not in official development documents.

At the end of the year 1991, the

Fundamentals of the Economic Policy at the Turn of 1991 and 1992, with a Programme of Measures, Institute of Economics Zagreb, December 1991,

was made serving the needs of the Government of the Republic of Croatia. As early as 1992 the first strategic document followed which dealt with the entire Croatian economy. In March the

Concept and Strategy of the Economic Development of the Republic of Croatia, Economic Trends and Economic Policy, National Bank of Croatia and Institute of Economics Zagreb, 10/1992,

was made for the Bank's internal use. It was conceived macroeconomically and dealt with privatisation, transformation, monetary, banking and financial systems, structural changes in economy, technological development, human resources, the environment and infrastructure. In 1992, the

Proposal of the Development Strategy of the Tourism Sector of Croatia, Ministry of Tourism and Trade, Agency for Restructuring and Development, Institute for Tourism, Zagreb, 1992,

was produced for the Ministry of Tourism. Of the noncommissioned strategy proposals published in 1992, one came from the highest possible level. It was

Traffic Valorisation of Croatia, Croatian Academy of Arts and Sciences – Scientific Council for Traffic, Zagreb, 1992.

The Croatian Academy of Arts and Sciences also published documents of a strategic development character later. Despite the reputation of the institution, it was not recorded that the agent of development policy had ever adopted any of the Academy's proposals. By the end of 1992 the Government prepared another:

Economic Policy Programme

which was adopted in Parliament in December 1992. By the end of the year 1993, however, the

Development Strategy of the Croatian Tourism (National Gazette 113/93)

was adopted, and the Ministry of Tourism was the first that turned to a foreign drafter. In the same year, a mixed group of Croatian and Austrian experts prepared the

Tourismus Masterplan Kroatien, Institute for Tourism and Horvath & Horvath Consulting, Zagreb, 1993.

The Croatian Railways followed the example, and turned to a Swedish specialized consulting conmpany. At the end of the year 1993, the

Study on the Reconstruction of the Croatian Railways, Swedrail, Zagreb, 1993,

appeared followed by the well kown

Stabilization Programme, Governemt og the Republic of Croatia, October 1993.

Apparently no document of the strategic kind was made in 1994. Quite a few appeared in 1995, however:

Development Strategy of Agriculture of the Republic of Croatia, Ministry of Agriculture and Forestry and FAO (adopted by the Parliament of the Republic of Croatia at the end of 1994, never published in the National Gazette),

Long-Term Plan for the Protection of Waters from Pollution (National Gazette, 22/95),

Declaration on Environmental Protection in the Republic of Croatia (National Gazette, 34/95),

Programme for Reconstruction and Development of the Passenger Fleet in the Period from 1996 to 2000, Jadrolinija, Rijeka,

National Programme of Demographic Development of the Republic of Croatia, Ministry of Development and Reconstruction, (adopted by the Parliament in May, 1995, never published in the National Gazette).

The production increased over the next years. In 1996, the

National Scientific-Research Programme for the Period from 1996 – 1998, (National Gazette 16/96),

was adopted by Parliament. For the needs of the Ministry of Development and Reconstruction and the Ministry of Maritime Affairs, Transportation and Communications, the following documents were prepared:

Development Strategy of Road Network in Croatia, Ministry of Development and Reconstruction, Ministry of Maritime Affairs, Transportation and Communications, Zagreb, 1996,

and the

Development Study of Croatian Harbours, Rotterdam Maritime Group, Zagreb, 1996.

In summer of 1996, the Ministry of Economy published the first results of a project initiated two years ago. The project was titled the "Development and Organisation of the Croatian Power Supply Sector – PROHES", and entrusted to the "Hrvoje Požar" Institute of Energetics. The first document was

Fundamentals of the Power Supply Policy of the Republic of Croatia Until the Year 2010, Zagreb, June 1996.

As two years earlier, and equally unbindingly, the Croatian Academy of Arts and Sciences produced two more strategies:

Road and Rail Transport Corridors in the Area of Croatia and Bosnia and Herzegovina, Croatian Academy of Arts and Sciences, Zagreb, 1996,

Present State and Future of Croatian Railways, Croatian Academy of Arts and Sciences, Zagreb 1996.

The following year two more strategic development documents were adopted by the Parliament:

National Island Development Programme, Ministry of Development and Reconstruction, Zagreb 1997, (adopted by Parliament on 28 February 1997, never appeared in the National Gazette),

and the

Spatial Planning Strategy of the Republic of Croatia, Institute for Spatial Planning, Ministry of Spatial Planning, Construction and Housing, Zagreb, 1997 (adopted by Parliament on 27th June 1997, never published in the National Gazette).

That year a discussion commenced on the routes and length of the future motorways, and the future of railways. The following was prepared:

Report on the State and Development Possibilities of the Road Network in the Republic of Croatia, with Reference to a Possible Sequence of Motorway Construction, Croatian Roads Directorate, Zagreb, 1997,

Development Strategy of the Rail Transport System of the Republic of Croatia, Transport and Communications Institute, Zagreb, 1997.

Development Strategy of the Rail Transport in the Republic of Croatia, Croatian Railways – Development and Information Technology Department, Zagreb, 1997.

The same year, CANAC, a Canadian consulting company, prepared the

Study on the Reconstruction of Croatian Railways, Zagreb, 1997.

At the end of December 1997, the Government of the Republic of Croatia took up the matter of gender and adopted a document titled:

National Policy of the Republic of Croatia for the Promotion of Equal Opportunities, The Equal Opportunities Commission of the Government of the Republic of Croatia, Zagreb, 1997.

In 1998 the Parliament adopted two development programmes of a long-term character:

Horse Breeding Programme in the Republic of Croatia, (National Gazette 99/98),

Programme of Return and Taking Care of Refugees and Displaced Persons (National Gazette 92/98).

The discussion about roads and railways went on. For the needs of the Ministry of Maritime Affairs, Transportation and Communications, the following was prepared:

Development Strategy of Road Network in the Republic of Croatia, Institute of Economics Zagreb, Zagreb 1998,

Project of Modernisation and Restructuring of the Croatian Railways, Ministry of Maritime Affairs, Transportation and Communications, Zagreb, 1998.

In 1998, the first results of the project started four years earlier by the "Hrvoje Požar" Institute of Energetics were published. In the beginning of the year, the

National Power Supply Programme: the Introduction, Goran Granić, "Hrvoje Požar" Institute of Energetics, Zagreb, 1998.,

was published, and thereafter

MIEE – Network of Industrial Power Efficiency, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

MAHE – Programme of the Construction of Small Hydro electrical Power Plants, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

ENWIND – Programme for Wind Energy Usage, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

SUNEN – Programme for Solar Energy Usage, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

KUEN zgrada – Programme of Power Supply Efficiency in Building Construction, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

KUEN cts – Programme of Power Supply Efficiency of Centralised Heating Systems, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

KOGEN –Co-Generation Programme, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

GEOEN – Programme for Geothermal Energy Usage, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

BIOEN – Programme for energy from Biomass and Waste "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998,

PLINCRO – Gasification Programme of Croatia, "Hrvoje Požar" Institute of Energetics, Zagreb, April 1998.

This package of programmes had a common mark "the preliminary results and future activities", so that further production of strategic development documents was to be expected in the energetics sector. At the end of 1998, the members of cooperatives also turned out. The Croatian Cooperative Association published the

Development Strategy of the Croatian Cooperatives, Croatian Cooperative Association, Zagreb, 1998.

The Parliament adopted two more strategic documents in 1999:

Traffic Development Strategy of the Republic of Croatia, (National Gazette 139/99)

Strategy and Action Plan for the Protection of Biological and Landscape Diversity of the Republic of Croatia, (National Gazette 81/99),

According to an obligation arising from the Spatial Planning Strategy of the Republic of Croatia of 1997, the

Spatial Planning Programme of the Republic of Croatia, Spatial Planning Institute, Ministry of Spatial Planing, Zagreb, 1999,

was produced. Upon the initiative of the Ministry of Health, a foreign drafter was contracted and the

Health Care Systems in Transition-Croatia, European Observatory on Health Care Systems, Zagreb, 1999,

was published. After the elections of 2 January 2000, and the change in Government, the new Government of the Republic of Croatia published:

Programme of Activities of the Government of the Republic of Croatia for the Period from 2000 – 2004, the Government of the Republic of Croatia, January 2001.

The Programme advocated an important change in the development policy in its entirety, and announced reduction in strategy production down to one single strategic document. In the same year, however, the Croatian Roads Directorate, officially, and the Croatian Chamber of Economy, unofficially, provided more contributions to the ongoing discussion about roads and their effects on development. The published studies are as follows:

A Consolidated Study of the Financial and Market Feasibility of the Construction of Motorways in the Republic of Croatia, Croatian Road Directorate, Civil Engineering Institute of Croatia, Institute of Economics Zagreb, 2000.

Traffic Development Strategy of the Republic of Croatia, Croatian Chamber of Economy, Zagreb, 2000.

The following studies were commissioned by the Croatian Railways and the Ministry of Health, respectively:

Study of Modernisation and Restructuring of Croatian Railways, RAILPLAN, Zagreb, 2000,

Strategy and Plan for the Reform of the Health Care and Health Insurance System in the Republic of Croatia, Ministry of Health of the Republic of Croatia, Zagreb, 2000.

The Croatian Academy for Arts and Sciences initiated and published the

Baltic – Adriatic Initiative, Croatian Academy of Arts and Sciences, Zagreb, 2000.

The implementation of the announced change of the Croatian Government's policy started at the end of July 2000 when the Development Strategy Office of the Republic of Croatia was established (National Gazette 77/2000). The Office was founded as a "professional service of the Government of the Republic of Croatia set to perform technical and administrative tasks related to the development strategy project for the Republic of Croatia: "Croatia in the 21st Century".

The Office launched a project that surpassed all the previous. Titled "Croatia in the 21st Century", it was supposed to gather all the people who have something to propose. It was made known that the Office would consider all the proposals sent to it, and eventually produce a single strategy that the agents of the development policy in Croatia would be obliged to implement. The participants to the discussion on Croatian development management were given a unique opportunity to present their views and proposals.

The number of proposals that ever reached the Office remained unknown. In any case, after a couple of months the Office engaged 335 various experts with the task of producing 19 sub-

strategies and the final long expected single national strategy. A year and a half later 19 sub-strategies did appear covering *health care, social care and pensions, transportation, power supply, state administration, international integration, national security, economy, macroeconomics, education, science, tourism, culture, environmental protection, maritime affairs, shipbuilding, alimentation, housing construction and information and communication technology.* They are still available at www.hrvatska21.hr. A single strategy, often referred to as THE strategy never appeared.

The production went on, however, unhampered by the Office or anyone else. In the year of 2000,

Programme of Measures for Economic Reform and Growth, International Bank for Reconstruction and Development, February 2000

appeared, followed by

National Mine Action Programme in the Republic of Croatia, Croatian Mine Action Centre, Sisak, 2001,

Development Programme for Small Trade, 2001 – 2004, Ministry for Crafts, Small and Medium-Sized Entrepreneurship, Zagreb, May 2001.

and the

Strategic Plan 2001 - 2005, USAID - United States Agency for International Development/Croatia, Zagreb, January 2001.

The agent of the development policy set by the USAID Strategic Plan was not to be a Croatian implementation body but the USAID itself. American experts were supposed to directly support local self-government, democratically oriented political parties, trade unions, media, NGOs, and advise ministries and the deputy prime minister. They also decided to help the macroeconomic and structural reforms that contribute to private sector development, support settling into routine the state treasury and further fiscal decentralisation, help in putting in order cadastre and land register and cooperate closely with the World Bank. No Croatian experts were envisaged in the process. Consequently, the USAID product was published only in American English.

The production went on, however. Five new models appeared in 2002, some resulting from the said 19 sub-strategies, some not:

Strategy of agriculture and fisheries of the Repunblic of Croatia (National Gazette 89/02)

National Strategy for Environmental Protection (National Gazette 46/02)

National Environmental Action Plan (National Gazette 46/02)

Development Strategy for the Energy Sector of the Republic of Croatia (National Gazette 38/02)

Defence Strategy of the Republic of Croatia (National Gazette 33/02)

National Security Strategy of the Republic of Croatia (National Gazette 32/02)

National Forestry Strategy and Policy (National Gazette 120/03)

In 2003 and 2004 only three strategies appeared in the National Gazette:

National Strategy for pension system and social care services (National Gazette 97/03)

National Strategy of unified policy for disabled persons for the period from 2003 to 2006. (National Gazette 13/03)

Development Strategy for Wood and Paper Processing Industry (National Gazette 114/04)

The year of 2005 was more fruitful:

National Strategy for Prevention of Misuse of Narcotics (National Gazette 147/05)

Waste Management Strategy of the Republic of Croatia (National Gazette 130/05)

Development Strategy for the official statistics servise of the Republic of Croatia 2004.-20012. (National Gazette 28/05)

and so was the year of 2006:

Communication Strategy for Informing the General Public on EU accession (National Gazette 13/06)

National Programme for Road Transport Security 2006-2010, (National Gazette 24/06)

National Anti–Corruption Programme 2006 – 2008. March 2006 (National Gazette 39/06)

Strategic Development Framework for 2006 – 2013, July 2006

Strategic Development Framework was produced by the Development Strategy Office of the Republic of Croatia which in the meantime underwent serious personnel and conceptual changes. The Framework was a substitute for the National Development Plan, a document that on request of the EU is supposed to be produced in every accession country. In 2006 the Government of Croatia also turned to gender issue again. The result was the

National Policy for Gender Equality Promotion, The Government of Croatia – Office for Gender Equality, Zagreb, 2006.

One is not surprised but it should be noted that gender strategy of 2006 makes no reference whatsoever to the gender strategy produced in the s**ame country and by the same Office in 1997.**

3. ALL THE PRESIDENT'S MEN

In the middle of February 2000, immediately after the election of the new president some new features appeared on www.predsjednik.hr. The president, namely, established five working groups and entrusted them with producing the development documents that would tackle the future of particular sectors of the Croatian society. They dealt with Constitution amendments, agriculture, sports, development of IT, promotion of Croatia and the Croatian youth. In no less then a year they produced the following:

Foundations for amendments to the new Constitution of the Republic of Croatia, Office of the President, Zagreb, April 2000 .

e-Croatia – Proposal on the Informatisation Strategy of Croatia, Office of the President, Zagreb, June 2000

Proposal on the Development Strategy for Agriculture and Areas of Special State Concern. Office of the President, Zagreb 2000

Proposal on the development strategy for the areas of special state concern, with special reference to the Danubian region Office of the President, Zagreb, 2000

Development Strategy for Fishery in the Republic of Croatia, Postira, Office of the President, June 2000

Development Strategy for Agriculture in the Mediterranean Area, Office of the President, Poreč, June 2000

Proposal on the Development Strategy for Sport in Croatia, Office of the President, Zagreb, 2000

National Programme of protection and promotion of children, youth and young people in the Republic of Croatia in the period of 2001 – 2002. Office of the President, Zagreb, 12 August 2001

To the bibliography of Croatian strategies, approaching a three-digit number of units after barely fifteen years of production, another 8 development documents thus may be added. It is easily noticeable, however, that not one of the 48 president's men grouped in 5 working groups appears among the authors of the sub-strategies of the project "Croatia in the 21st century". Consistently, none of the authors **of the sub-strategies participated in the groups that drafted the president's products.**

4. IMPLEMENTATION PROBLEM

Since this is all about the future, one should ask what the listed strategies, long-term programmes and national plans have to contain in order to deserve their titles, and what elements have to be met so that the future they seek becomes about. It is obvious, namely, that a strategic document is only one of the elements of efficient development management, and that it implies also implementation documents, an implementer with implementation instruments in his/her hands who can undertake implementation measures; it includes monitoring the effects of the measures, and supervision of the entire process. An important element is also the participation of the citizens. In a democratic society an insight into the implementation of the adopted strategic orientations has to be made available to everyone.

Regardless of the possible value judgements, and even ideology it may implicitly or explicitly advocate, a strategic development document should contain the answers to some basic questions:

- does the document define basic notions?
- does it determine the principles of development management?
- does it define the goals?
- does it deal with the past and the state of the area/field it deals with?
- does it make any prognosis, value judgements, projections?
- does it define instruments and measures; does it propose laws to be passed that would raise the obligatoriness of the measures to the highest level?
- does it examine the capacity of implementers (if any have been specified)?
- does it contain an action plan or a management plan, and if it does, are the time limits set, the jobs and tasks distributed, the agents identified, and are the sources and modes of financing determined?
- is there any monitoring proposed?
- is it a readable text, a material that shall educate a reader?

There are a couple of formal questions too:

- is it preceded with a law or a decree of the Parliament or the Government of the Republic of Croatia ?
- who initiated its drafting (a ministry, a public company, etc.)?
- do NGOs participate in the drafting?
- did it appear in the National Gazette thus becoming an official, i.e. obligatory development document?

Some of the answers may be read directly from the thousands of pages of the Croatian development strategies, some are vague or implied in the text and some are to be found in chapters where they, one would say, do not belong. It may be often indirectly concluded that the authors worked out the main conceptual framework but they did not, regretfully, explicate it anywhere. Barely one half of the collected documents, for example, define in their introduction part the notions which will later be used to express strategic orientations. On the other hand, practically all the documents state development goals and principles. However, an analysis of goals shows that goals and principles may be notionally mixed up, and that particular expected accomplishments get mixed up with processes that need to be established and maintained. That is, it is often not clear whether a goal is understood to be a state that is

to be achieved or a development route that must be insisted on. This vagueness later on influences the formulation of the development guidelines. Therefore, it is sometimes difficult to see what the difference is between the stated principles and the derived guidelines at all.

The production of strategic documents is most often initiated by ministries and public companies, and rarely by the Government of the Republic of Croatia itself. Since the ministries can rarely assign their own civil servants for such a task, they regularly employ experts and scientists from institutes or faculties, and much more seldom foreign consultants. Due to the fact that the production of a strategic document may last more than a year, and it needs to be coordinated, the ministries and public companies avoid the individual engagement of an expert, and more gladly appoint for the whole task an institute, a bureau, a faculty or similar (NGOs stay out of this business, except in cases of strategic documents in the field of the environment protection). The production of strategies thus does not disturb the everyday life of the civil service, and the responsibility for the result rests entirely with the producer.

There are very few documents that had to be produced as a result of a law or a document which prescribe that another law be passed afterwards. A good example is the Law on the Environment, which prescribes the production of a strategy, and on the other hand the National Island Development Programme that prescribes an Island Act to be passed (the environment strategy was produced, and the Law on Islands was adopted in 1999, two years after the adoption of the National Programme by the Parliament). As regards the international conventions that are binding for the Republic of Croatia, they are only referred to by a strategic document that deals with the environment.

Out of the collected strategies, programmes and long-term plans, 11 were published in the National Gazette in the 1990s and 16 in the new millennium. What catches the eye is that there are four documents adopted by Parliament, but they were not officially published.

The collected strategic documents are at their best in their starting chapters. The evaluation of the past development is usually extensive, whereas economic strategies usually bring chapters with prognoses and projections that do not reach further than 5 years into the future. The strategies in other fields most often are limited to prognoses. What should be done to realise projections and prognoses, this is a question that relatively little attention is paid to. The instruments that are formally at the disposal of the implementer are mentioned in most strategies, but the competence of the implementer is considered in none of them. It remains unknown whether the implementer (whether a ministry or a public company management board) has enough officers at its disposal, whether they are educated and acquainted with the job, whether IT support is adequate, whether the required information is collected and so on. Consequently, none of the collected strategic documents deal with monitoring and evaluation. It remains unknown who shall monitor their impacts and how, what criterion will be applied in evaluating the measures and their instruments and how the measures whose impacts are not satisfactory will be changed. The monitoring and evaluation of instruments and measures is missing even in strategic documents that contain an action plan. This is so even in the case of the strategies in the field of the protection and improvement of the environment, that are produced according to the model of European and American documents of the same kind so that one could expect to find M&E there. In a word, anything that might look like an institutional analysis has been completely missing from the Croatian strategic development documents since 1991 till now days.

Strategic documents that determine sources and modes of financing are also rare. The sources that are perhaps mentioned are the state budget and foreign donations, while other possibilities are hardly discussed. Apparently, this aspect of development management is left to the implementer and to his/her ability to find the necessary budgetary means. One will search in vain trying to find the items in the National budget that refer to the implementation of strategies adopted in previous years. Introduction of programming budgeting in 2003 does not seem to have brought any improvements in this sense. Strategies prepared from 2003 onwards obviously require some money for their implementation but this is not to be found in the National Budget. The neglect of financing is partly a result of the neglect of the implementer. Since the guidelines are usually written in the form of "it needs to …" and "it is expected to …", without precisely addressing the implementer, the fact that finances are left out is not obvious. Operational summaries, which are a regular practice in foreign production strategies, are rare in Croatian ones, there is no accepted bibliographic standard that the editors adhere to, the language is usually dull, the vocabulary technical and unfamiliar to the uninitiated reader.

The strategies can be placed into different groups. As one would have expected, the most frequent topic is the economy and how to improve it. Five strategic documents on the construction of roads may surprise only those who are not familiar with the construction industry sector in Croatia and its influence on development decisions. Seven railways strategies may surprise only those who are not familiar with the state of Croatian Railways. On the other hand, social issues are poorly covered. One of 24 ex-socialist studies from 1990 is about education and one had to wait for ten years to find something similar. "Croatia in 21 Century" project contains sub-strategies on education, health (the Ministry of Health produced a separate one, as well), culture, and social care. Two strategies on gender equality are recorded. There is also the Programme of Return and Taking Care of Refugees and Displaced Persons from 1998, and that is all. The social aspects of overall development which need most careful programming have been payed least attention. Old ideas about growth which necessarily brings development seem to be still alive, even kicking.

Among the producers of the strategies that were not commissioned by the state administration the majority are economists, and a particular place is taken by the Croatian Academy of Arts and Sciences. In spite of the proverbial shortage of money the Academy works in, it produced four documents of strategic importance.

A strategy, as it is often emphasised, in its original meaning is the "art of conducting a war". Moreover, one may find in vocabularies that it is "manoeuvring forces into the most advantageous position prior to actual engagement with the enemy". This is, so it seems, an exclusive male business, so it does not hurt to investigate how many women have been involved in it. The two biggest projects in the field may be used to illustrate this, the Scientific Foundations of the Long-term Socio-economic Development of Croatia, from the end of the 1980s, and "Croatia in the 21st Century" from 2001.

Thumbing through the nowadays already dusty volumes of the Scientific Foundations, one will notice that 239 collaborators and 86 collaboratresses (73 : 27) worked on the project. Since the coordinators and the editors were listed separately from the authors, one may notice that there were also 204 authors and 80 authoresses (61 : 39). Among 31 sub-editors there were 4 women (87 : 13), and among 10 coordinators two were women. Some ten years later "Croatia in the 21st Century" and its 19 strategies were initiated. The coordinators composed the Central Council of the project. Browsing through the site www.hrvatska21.hr, one notices

that 18 coordinators and a male president of the Council make company to only one woman. Some participants in discussion about development and its management would call this a gentleman's trend. Fifteen years ago on average 4 male coordinators would hold one lady's coat, and nowadays they are as many as 18. The situation is no better even among those who do the actual job. The share of authoresses fell from 39% to 29%.

The questions that need to be asked when standing in front of a hundred strategic development documents are not yet exhausted. One of the more important is definitely on internal consistency. Namely, if a strategy is internally inconsistent even the best functioning implementation mechanism would not help. However, this is a necessary, but not a sufficient condition since internal consistency does not guarantee per se that the strategy is good and acceptable, but only that the tasks before the implementer are not adverse to each other. If a strategy is internally consistent, only the first step on the way to the successful development management has been confirmed. The remaining steps will depend on the implementer.

It is not easy to answer with certainty how many strategies of the ones collected are internally consistent, and how many are not. A document picked up at random show that the authors controlled their work and that the final instructions are harmonised among themselves. Almost each of the examined strategies may be implemented if only it were supplemented with an action plan and supported with an adequate budget. The question that definitively has to be answered is the one about the internal consistency of a pile of strategies that has been growing ever since 1990. Although it is difficult to assume that almost a hundred strategic documents (the coordinated documents are only those from the Scientific Foundations project of 1990, and those from the Croatia in the 21st Century project) may be mutually harmonised, one should at least hope that sub groups of strategies produced about the same topic, that is within the same sector, could be harmonised. An insight into sub groups shows, however, that they are equally inconsistent as the big pile they belong to.

Between the strategic documents in the same sector that are supposed at least to refer to the previous ones but do not, there are two strategies on health care that need to be singled out (the strategy of the Ministry of Health and the one from the "Croatia in the 21st Century"), as well as the majority of the already mentioned road and railway strategies. It is readily observable that inter-harmonisation avoids precisely those documents for which one would expect mostly to be the case – the documents that predominantly or exclusively deal with the environment. The Spatial Planning Strategy of the Republic of Croatia of 1997, for example, explicitly and extensively deals with the Croatian islands and the preservation of the insular space, without mentioning the National Island Development Programme at all, although it had already been adopted by the Parliament at the time the strategy was written. The reason for it are not potential conceptual disagreements, but simply the low level of communication culture that is a characteristic of the majority of the producers of the Croatian strategic documents. Namely, the comparison of the Strategy and the Island Programme reveals that both documents refer to the more or less same principles of island development management, and that their development policy proposals are compatible. By referring to the National Island Development Programme, the Spatial Planning Strategy would have been better argued and definitely more convincing.

Environmental protection is a suitable field for questioning the coordination of strategy production. The environment is, more or less, directly or indirectly, the topic of the majority of strategic development documents, and those which deal with the environment directly, rely on, at least in words, international conventions. However, the often-quoted principle that we

have to take care of the environment as a public good together and in co-ordination, is not being implemented. Namely, the production of two strategic documents on the environment began during the year of 2000 and ended with joint appearance in the same issue of the National Gazette in spring 2002. The first was produced within the already mentioned "Croatia in the 21st Century" project as a sub-strategy and eventually titled the National Strategy for Environmental Protection. The second was produced by the then Ministry for Environment Protection and Spatial Planning in cooperation with the World Bank and its experts. It is titled the National Environmental Action Plan (NEAP). Having put them one next to the other, the two documents definitely deserve a little bit of attention.

The Environmental Sub-strategy for the 21st Century was produced by seven collaborators, three editors and one project director. The document has 84 pages. In contrast to these eleven people, the NEAP had a Managing Council composed of eight members and headed by the Minister for the Environment, two coordinators, a Project Unit in the Ministry for Environment Protection and Spatial Planning composed of 7 members, a World Bank team of two members and 139 collaborators who were organised in 10 working groups, and these into 29 sub-groups. The document produced has 298 pages including supplements (not even 2 pages per person). The two environmental strategies were produced simultaneously, but separately. Comparing the lists of authors, it turns out that only three of them worked on both projects, and the documents do not refer to one another at any stage. The differences that were, for that reason, inevitable may be noticed in contents and in the weight given to particular aspects of environment protection.

A comparison of these two texts shows that eleven authors that needed 84 pages to produce the Environmental Sub-strategy were sufficient to determine strategic orientation, to put together instructions for their implementation, to determine the action priorities, and to make a SWOT analysis of a system that should materialise all of this. The scope of the NEAP (this production was, obviously, many times more expensive) may be, on the other hand, justified with the emphasis on the action plan and the importance and space dedicated to the priorities. The comparison also reveals that both strategies are based on the concept of sustainable development, but that the sustainability is not equally defined, that they are not terminologically harmonised, and that NEAP's priorities are not well thought out. The best example of this is the approach to one of the largest burdens on the environment of the Republic of Croatia – land mines. The sub-strategy disregards the fact that 4,500 sq km of the country is contaminated with about a million mines (however, it is the only one that deals with genetically modified organisms), while the NEAP dedicates only two paragraphs to it: one in the section covering agriculture and forestry, and the other in the section on the influence of pollution on health. Thus demining appears in the list of measures to be taken. "Perform demining of agricultural areas within the period of 2 – 5 years" and "perform the strategy of demining of forests within 2 years" appears in the chapter 4.1.3. on agriculture and forestry. "Perform demining throughout the entire territory of Croatia within 2 years" says the chapter 5.4., which deals with environment and health. The state budget, the county budgets, the city and municipal budgets, the economic sector and international sources, all are listed as possible sources of financing this task without any specifications or dynamics. It should be mentioned that the National Mine Action Programme of the Republic of Croatia published in 2001, envisages that this work be done, at very best, in 10 years.

The quotation of financial sources is characteristic of both strategic documents, as well as for the most of the other documents produced since 1990. The sub-strategy claims that finances are necessary, but it does not quote a single figure, whereas the NEAP has doubts about the

figures it states. In the Chapter 9, when referring to implementation expenses it is reported that only 0.2 to 0.3 % of GDP in Croatia is allocated directly for the environmental protection today. The text goes on to say that the implementation of the NEAP requires at least 1% and that this is almost impossible to achieve.

In any case, a comparison of the two documents shows that the task could have been performed faster and cheaper by forming a pool of authors, and that had there been coordination it could have been internally consistent, even harmonised with other strategic development documents. The next question that has to be asked is seemingly a trivial one. It is rarely clear in the collected strategies and programmes WHOSE job it is. The answer: the strategy is ours, and we are all realising it, may satisfy only inasmuch as the document that has a prefix "national" or a suffix "of the Republic of Croatia" concerns all of us, so we are all interested in its realisation. At this point the general arrogation stops. The strategy that cites goals, that demands their accomplishment and names necessary instruments and measures, has to determine also who shall accomplish them and what are the consequences should they fail to do that. In this respect, the predominant number of Croatian strategic documents remains unclear, reflecting one of the problems that shall continue to burden the economies in transition and their societies in general: lack of readiness to analyse the institutional mechanisms necessary for the implementation of any kind of strategy, programme or economic and social policy in general. Present creators of the Croatian strategic documents still tend to address the task to an "implementer", to an "agent of development policy", to "the relevant ministry" and the like as if they were writing the document in the 1950s or 1960s when it was safe and normal not to mention the untouchable "implementer". The problem is to a great extent overcome only in cases when the strategic document adopted by the Parliament of the Republic of Croatia requires that a law be enacted. The ordered strategic jobs and tasks thus are raised to the highest possible level of obligatoriness, and a law can hardly be enacted if it does not contain stipulations about controlling its implementation, time limits and necessary financial sources.

Since 1990 up until now there have been more laws adopted in Croatia that determine the instruments and measures of the development management, than there have been development strategies written. They invoke the Constitution and/or some other law, but not a strategic development document. In addition the enacting procedure does not guarantee mutual alignment of the enacted laws. It does not even guarantee that the law shall be internally consistent. The amendments, in fact, depend on the deputies' vote, and there is no mechanism that would automatically prevent voting of an amendment that is contrary to another one, just voted for. An inconsistency thus can slip through, and even a cursory insight into the legislation that regulates development management points that it happens quite often.

Another point that the implementation of laws makes disputable is standardised last article which states that the law "Shall come into force on the day of the publication in the National Gazette" or "Shall come into force on the eight day following its publication in the National Gazette". This routine provision contains several preconditions necessary for the enforcement of laws, and with this also of development policy. It is presumed that all those who are supposed to start enforcing the law as of the day it is published, know what they have to do, that they are all present, that they have assigned the required time for it, established the necessary organisational scheme and provided the equipment. Regretfully, these suppositions are realised hardly anywhere and hardly ever, so that most of the laws start their life with difficulties and slowly, discovering the already mentioned inconsistencies along the way. The research on the enforcement of development legislation and its efficiency in Croatia is almost

non-existent. The laws come and go, and there is nothing to draw a conclusion from whether they were beneficial or not. The trust in the efficiency of law, the expectations of significant improvements that new laws are to bring along, and everything else that comes under the term "normative optimism" do not have much backing in the Croatian practice.

More than a hundred development strategies, never undergoing the process of harmonisation and definitely not harmonised and a part of the development legislation arising thereof, obviously are not a solid base for the management of Croatian development. However, development decisions are still being made. The final question to be tackled here is: how?

5. TOWARDS A STRATAGEM?

Standing in front of a bookshelf with a hundred disharmonised strategies, one could ask himself/herself what directives and what aims the many decision-makers of more or less important development decisions dispersed in various ministries, in the Government, public companies, and elsewhere, have in mind. If the strategies were lacking, their ability to make strategically sound decisions would have been questioned. Since the strategies are in abundance, what should be questioned is their capacity and willingness to act as democratically elected policy makers are supposed to.

In the years of the war and the beginning of the transition the question would have been answered straightforwardly since democratically elected policy makers where under quite a pressure. The circumstances were changing much faster than any one could manage to change strategies, action plans, laws, regulations and the rest and whoever was in charge had to act and only act. This was one of the reasons (not the only one, however) that led to the establishment of the semi-presidential system introduced by the 1990 and 1997 Constitutions. In 1997, the Defence and National Security Council (DNSC) was formed, a body whose members the president could appoint at his own discretion. The DNSC consisted of his advisors, the most important generals, the prime minister and some ministers, the Speaker of the Parliament, the governor of the National Bank of Croatia, and so on. In this way, all the decisions relevant for an overall development of the country could have been made at one table and under one coordinator. These could have been strategic or purely operational decisions, and their implementation was guaranteed by the composition of the Council itself. The President of the Republic, invoking the Constitution to remain the president of the party that had a majority vote in the parliament, could plan, induce, direct and even oversee all procedures and decision-making flows when deciding on the development of the country. The DNSC members promptly implemented everything that was agreed on in the sessions. If a piece of legislation was needed for the purpose, the authority of the Government to pass decrees with legislative powers and a legalised emergency parliamentary procedure allowed for a fast enough institutionalization of whatever was decided about at the DNCS. Although more than 50 strategic documents had already been piled up, they were scarcely referred to by anyone, while the important development decisions were made in a non-transparent manner and could not be found anywhere.

Many would agree that the wartime management of peacetime development had too many snares to be successful in the long run. They would also agree that its immanent lack of democratic features makes it completely unacceptable in a market economy environment. A minority would, however, adduce few of the "wartime" decisions that resulted in exceptionally favourable effects, as well as many "peacetime" decisions that brought nothing good at all. The best example to support this type of thinking and, seemingly, legitimise the

autocratic decision making, is the still topical anti-inflationary policy implemented in Croatia in the autumn of 1993.

The new millennium brought the new Constitution and the power of the president was significantly reduced. The new president's newly formed working groups readily started producing strategies showing, perhaps, that those who have executive power do not need strategic documents whereas those who lack power produce them. The decision making went on, however, so that one has to turn to the Government, main ministries and headquarters of the main political parties where decision makers have concentrated after the DNCS disbanded. At the beginning of the new millennium draft laws, government decrees, and other pieces of legislation that define taxes, fines, incentives, government spending and other instruments of economic policy have been designed and approved right there.

Decentralization of decision making and its shift towards democratic institutions implies involvement of much more agents than there were in the DNCS. It also implies democratic procedures, transparency and able public administration. One should not forget, however, that the public administration where the instruments are designed and approved is composed of professional civil servants, who mostly keep their jobs after the elections, and of politicians who get appointed every four years. In countries where the civil service is developed, the tasks of these two groups are elaborated and separate. The civil servants, helped by external advisors and collaborators prepare background materials for decisions, elaborate options for possible solutions and simulate the consequences of any given decision. A politician in power who has to make a final decision needs to evaluate the submitted options and their effects from a political point of view, and finally accept one of them.

As for transition Croatia, these tasks are not well apportioned. Civil servants are not necessarily competent or well organised, and decisions often have to be made quite abruptly. In such an environment politicians do not get (or can not wait for) enough input to make a good decision. The decisions actually adopted, on the other hand, too often bear testimony of a prevalence of short-term and pragmatic political interests over expert opinions. Therefore, in the past fifteen years, successful development management agent had to be quite a person. A successful minister of finance, for example, had to know everything about finances and economic policy and how to deal with his subordinate civil servants. He also needed to be a very able politician and survive in an environment of constant struggle for power, because the implementation of a measure or a so-called package of measures usually takes more time than the usual mandate would allow for. An agent of development management surrounded by the unknowns of transition process who wishes to do something, must be a leading expert, an exceptional manager and a very accomplished politician. Unfortunately, persons of such a renaissance reach have been rare in Croatian ministries and governments so that the chain that starts with a strategy and ends with a proper policy implementation have always missed a link or two.

Thus, it is no surprise that first six years of the new millennium brought 55 new strategic documents and hardly any implementation improvements. As well, it is no surprise that no one from the public administration ever reported any implementation results and that hardly any question on monitoring and evaluation of those who have to implement strategic documents has ever been posed in the Parliament. In the course of fifteen years production of strategies has established itself as an autonomous activity whereas those that had to implement them took the liberty of equally autonomous decisions making. The purpose of strategies is thus fulfilled regardless of their quality, internal consistency and clearness. They

appear as false indicators of a well managed development, look good in public and keep experts dependent on politicians. The fact that production of strategies is ordered, financed and adopted by those that are not implementing them tempts one to go back to the same military dictionary that the development terminology has been picked from. Next to "strategy" a term "stratagem" can be found there with an explanation that it is "an artifice or trick in war for deceiving and outwitting the enemy" or even "a cleverly contrived trick or scheme for gaining an end".

A glance at the list of strategic documents reveals that they have been more frequent in last couple of years and that they much more frequently appear in the National Gazette. Initial awe of producing something so important and nationally significant as well as initial bond that something that has appeared in the National Gazette is compulsory have disappeared. After fifteen years of facing no consequences for not implementing anything, one feels quite safe.

1. INTRODUCTORY OBSERVATIONS

Can nowadays a firm survive in the competitive surrounding in spite of its acceptance of business ethics and social responsibility standards that are sometimes too high? Is it at all possible to talk about ethical and social responsibility standards that are too high at the beginning of the third millennium? Social awareness is developed concurrently with development of society and it corresponds to the higher level of assumed ethical standards and social responsibility. Rejection of these standards makes the long-term survival of any firm questionable.[1]

Competition in the global market is frightening today. Price wars sometimes push firms to the *verge* of bankruptcy.[2] Can an affirmative attitude be expected from competitors in terms of social responsibility and the accepted level of social responsibility in routine business operation?

How much does the acceptance of an adequate level of business ethics and social responsibility in business operation collide with merciless competition? Are ethics and social responsibility in transition countries markets utopia or competitive opportunity? The relations of global supply and global demand sometimes do not allow the possibility for acceptance of an appropriate level of business responsibility and ethics.

Competition is often unscrupulous. Is it a coincidence that in such cases changes take place on the market? Leaders lose part of their market share, while the share of some

other companies grows. Is it a coincidence that in these new competitors the standard of social responsibility and business ethics is on an appropriate level?[3]

Analyzing past events it is possible to recognize the reasons for the diminished market share. This reduction and even irreversible loss of market share occurs in spite of all actions taken. Even then, departure from the ethical codex and declining of social responsibility can hardly be beneficial for the firm. Still, in practice it is sometimes felt that *anything* is allowed for market survival. In spite of everything deepening of business collisions continues while market share is getting smaller and eventually the hard obtained market position is lost.

Nevertheless, some other firms survive successfully without departing from ethical codices. They do not see their social responsibility as mere formality but as part of their market image. They survive in spite of everything. It seems that the market *protects* them by some *special instruments*. Seen through the prism of strategy they have clearly created their own *market niche* by such approach.[4]

An analytical approach to this issue requires appreciation of both *winners* and *losers*. Why do many firms nowadays depart from the ethical codex? Why is social responsibility for business actions undertaken on the markets of transition countries forgotten?

Let us propose the starting hypothesis that acceptance of an appropriate standard of business ethics and social responsibility represents the firm's strength on the global market. Haven't ethical operation and an appropriate standard of social responsibility allowed maintenance and growth of market share in some of the most powerful global companies?[5]

What is the practice in the transition countries markets? Are there ethical codices and social responsibility utopia or competitive advantage? Such fast growing markets, which are not characterised by an even development dynamics, are specific. Extraordinary quality is appreciated at competitive price.

Is it possible to prove the hypothesis that in these markets respect of ethical codices and confirmed social responsibility support creation of the leader image?

2. ETHICS AND SOCIAL RESPONSIBILITY

Ethics[6] is defined as a philosophic discipline dealing with morality issues. As a general humanistic and scientific discipline ethics has a variety of application areas, among which especially significant are *professional ethics.* One of the professional ethics is business ethics that is dealt with in this work. Business ethics is a comparatively new scientific discipline arising from practical application of ethics in economy. Nowadays business conditions are significantly different especially in terms of establishment of an ethical codex within a company. However, disregard of basic ethical principles and violation of basic human rights is still existent. Ethics cannot substitute some important functions or solve business problems in a company. It can however improve the areas of relations to customers, competition, employees and market environment.

The reason for the rise of importance of ethics lies in development and acceptance of marketing principles, as well as in the higher level of awareness in management. A more appropriate treatment of an individual in business and living environment results in higher operational efficiency. Eventually it has repercussions on the competitive position of the company. In this sense this is a form of individual ethics. An individual acts in synergy with the company, in contact with colleagues, customers and other subjects in the business environment. When within a business system some crisis occurs, ethical approach often points to the weaknesses that have caused it.[7]

Organizational behavior is a system of individual behaviors which are collectivized. This system is the basis from which social responsibility is defined. The concept of responsibility is often related to business ethics due to complex situations of acting and decision making in business practice. Such acting and decision making have repercussions on the business environment and on all the subjects existing and operating within it.

Business challenges nowadays require directed, aimed acting. The reason for that are limitations on the demand side. These are particularly material and ethical limitations within legal and generally accepted framework. Legal regulations are supplemented by moral standards of the society, and are a framework for market operation. In parliamentary democracy legal regulations reflect basic social values. This overlapping of law and morality is a platform for development of operative models of ethical behavior and acting in the area of social responsibility.

3. ETHICS IN BUSINESS DECISION MAKING

Each business decision is the result of some motive which stimulates the company management for particular target behavior. Each business decision has its moral characteristics.

A decision is of appropriate moral value if it is made on an appropriate way and in compliance with the behavior standards. In these terms we speak of socially responsible behavior. Business decisions are related to business procedures. They are appropriate if

A decision is of an appropriate moral value if it is made in an appropriate way and in compliance with the behavior standards. In this sense we talk about socially responsible behavior. Business decisions refer to business procedures. They are appropriate if they are stimulated by a positive motive in terms of social responsibility.

Behavior compliant with law need not always be socially correct. Update of legal regulations is always delayed in comparison to social and economic relations on the market. In this sense, justification by a legal norm may not be socially acceptable.

In this context, practice has shown that[8]:

- Law embodies many moral convictions;
- Law represents a clearly defined system of behavior rules;
- Law contains rules applied equally on all, but what is important in business is synergy and consistency of operation;
- Law is not totally impartial;
- Legal regulation is insufficient without integrity of business people and socially responsible behaviour in economic activitites.

Starting from the above listed statements, frequent causes for ethical problems in business practice are the following[9]:

- Promotion in competitive environment with personal profit and egocentricity of action. Personal profit and egocentricity cause serious ethical problems to individuals and business environment. Ethical characteristics of an individual are often recognized only after some time. The existence of individuals within the business system who put their own interests before the common interests is the first precondition of unethical corporate operation, and also of actions that are not compatible with an appropriate level of social responsibility.

---

[8] Andreasen, A. L., *Ethics in Social Marketing,* Georgtown University Press, Georgtown 2001.
[9] Šerić, N., *Učinci uključivanja zemalja različitog stupnja razvijenosti u ekonomske integracije*, magistarski rad, Ekonomski fakultet Split, Split 2002.

- Complex market relations and increasingly complex operation models in terms of realization of long-term corporate profits. This is exactly the basic reason for resorting to unethical activities in order to maintain market share and target profit. It is to be assumed that competitively inferior companies might restore to unethical actions, however in practice even market leaders may act contrary to business ethics and social responsibility.

- Business aims may be set contrary to generally accepted social values. Thus ethical problems also arise because of the interest conflict between the company and ethical principles of employees. These are the situations in which the management requires the employees to take actions in the interest of the company which can eventually be detrimental to themselves, to customers, other employees, the company and wider community.

- Cultural conflicts due to existence of multinational companies. Uniformity of operations in a number of countries with different ethical standards also results in ethical problems and misunderstanding of behavior by the local market environment.

Another frequent phenomenon in the modern business practice is the so called *bottom line mentality*[10]. Such behavior is manifested as improper mentality of employees towards competitors due to which ethical principles are also neglected.

3.1. Platform for ethical behavior model in business practice

The third millennium will bring new qualitative standards of business ethics and social responsibility. In this sense, having analyzed a number of cases in practice[11] we can set a platform for building ethical behavior model on the transition country market.

Starting from such a platform it may be possible to meet both the set profitability criteria and the appropriate levels of business ethics and social responsibility. It is important that ethical codex is not comprehended as a reaction to something that is already done. The basic difference in approach is an a priori simulation of consequences, or *preventive ethics*.

When a manager finds himself in a moral dilemma, he has to recheck the possibilities and evaluate consequences in order to choose and make an appropriate decision and eventually act in compliance with ethical principles. When analyzing practical cases the authors used the following *control questions* [12]:

---

[10] Kotler P. : *Corporate Social Responsibility*, New York, Huboken: Jon Wiley And Sons Inc., 2005
[11] Šerić, N., *Oblikovanje i odabir strategija marketinškog menadžmenta,* EF Split 2005. godine, doktorska disertacija.
[12] Šerić, N., *Oblikovanje i odabir strategija marketinškog menadžmenta,* EF Split 2005. godine, doktorska disertacija

- Is the business problem exactly defined?

- How would thee same problem be defined from the aspects of customer, supplier, or any subject involved in this business relationship?

- What are the reasons leading to this particular market situation?

- To whom or to what are we loyal as a firm?

- Which is the basic intention in this particular decision making?

- Is it possible to compare the intention with the possible consequences, and in which way can it be done?

- Who can be harmed by the decision made?

- Is it possible to evaluate the correctness of future decisions and actions in the long run?
- Is it possible to present the business proposal in simple terms to superiors and to community?
- Under what conditions is it possible to allow partial departure from the plan?

The answers to the above questions can ease the dilemma in choosing options in terms of their morality and consideration of social responsibility in the business environment.

3.2. Application of ethical behavior model in business practice

Even if a firm seems to be a business subject that behaves ethically, this impression may be a wrong one. In critical market situations even an appropriate approach can result in unwanted consequences. Situations may often press employees to make decisions which are neither totally right nor totally wrong. Such cases reveal the importance of introduction of the system of ethical business behavior management in compliance with social responsibility.

The contents of business behavior management system is defined in accordance with the needs of a concrete firm, but in the practice observed by the authors it was revealed that business behavior policy most frequently involves the following aspects:

- Accurateness of business data

- Harmonization with laws, regulations, and company policy

- Possible corruption and interest conflict

- Abuse of available possibilities

- Relations to customers and suppliers

- Environment protection

- Equal conditions of market operation

- Inappropriate tactics

- Actions based on political activities

- Product quality

- Health protection

- Data security protection

- Intellectual property protection

- Data management

- Control and prevention of ethical offense

- Use of all company resources, IT equipment, and information.

Improvement of team work is a concrete result of company business ethics management. Openness, frankness and feeling of community, as the basic elements of team work, build an appropriate level of communication on common values. In that way synergy of action is improved among employees, and synergy of action provides efficiency of corporate market operation.

Ethical programs are necessary in creation of a favorable internal and external corporate image. Eventually, the question for any firm is what is to be done to affect market environment that will stimulate ethical behavior and decision making.

In business practice the authors observed that ethical principles were implemented by the following mechanisms[13]:

- Leading by example.

- Setting up of ethical codex: declaring values and elaborating ethical behavior codex.

- Establishment of *ethical structures* by ethical *representative:* by ensuring support of the Management Board, defining goals, appointing employees in charge, constant contacts with the Board members, and regular surveys.

[13] Šerić, N., *Oblikovanje i odabir strategija marketinškog menadžmenta,* EF Split 2005, doctoral dissertation.

- Application of ethical behavior models through education and training, and establishment of appropriate communication lines structures.

- Building of organizational culture based on ethical principles: investigation of the alleged ethical offenses, corrective and preventive actions, discipline measures, measurement of effectiveness, control and reporting, follow-up and recording of positive examples, and continuous improvement of behavior standards.

Leading by example is a practical pattern for adoption and adaptation of ethical behavior in the firm's business environment. It is realized by establishment of behavior patterns to be followed. Behavior patterns are established from top to bottom of hierarchical pyramid, and the basic responsibility rests with the management. Leading by example represents the basis of successful ethical behavior development independently of other practicable mechanisms.

Ethical codex represents formalized behavior describing the system of common values and rules to be obeyed by employees. Ethical codex defines policies, procedures and rules related to appropriate behavior such as employees' privacy, disposal of firm's resources, conflict of interest, etc. In order to be stimulating for ethical behavior, ethical codex should also assume forms of concrete behavior that is undesirable or forbidden; it must contain directions for correct behavior; it must be accepted by the management and implemented through system of rewards and penalties

Nevertheless, not even application of ethical codex can solve all the problems. There are always conflicts with personal value systems, rules are often too general, new ethical dilemmas are not timely updated, and sometimes it is just disobeyed in spite of everything. In order to reduce the shortcomings of ethical codex in practice, some other ethical statements are introduced. Most frequently they take the form of a *business slogan* – a short and meaningful statement of organizational values, activities, and desires. Very frequent is also a *declaration of values* – a document stating and defining basic ethical values, ideals, and principles of the firm.

Ethical structure system assumes the establishment of an organizational body or an individual responsible for observation of ethical problems. *Ethical board* supervises corporate behavior ethics, makes conclusions on ethical issues, and takes measures to ensure ethical behavior of employees. Members of such a body can be eminent individuals from the firm itself or even external experts. Ethical representative is usually a specialist in business ethics and act as the Management Board *consciousness*. This person will take part in strategic decision making by testing the ethical value of decisions. This person must possess excellent communication and presentation skills, objectivity, professional maturity, political awareness, rationality, expertise and knowledge of legal regulations, readiness to make autonomous decisions, managerial abilities, reliability and confidentiality.

Other mechanisms represent operational behaviors to complement the above stated basic ethical mechanisms. Each firm has a specific structure and consideration of its specifics is the fundamental step towards the build up of its ethical system.

466

These specifics are even more pronounced in the markets of transition countries where developmental oscillations frequently result in ethical dilemmas. Right due to this acceptance and respect of ethical principles and social responsibility will be a potential strength for every firm as well as a platform for differential market operation.

4. CONCLUDING OBSERVATIONS

Compliance with the established principles of business ethics and social responsibility contributes to humanity and performance of the firm. This creates and improves a corporate culture that will itself provide an image and market recognition of the firm. Complexity of market relations and social relations in the transition countries market frequently results in unethical behaviour and departure from an appropriate level of social responsibility. Survival in fast expanding markets is complex. Risk of survival often creates fear and desire to make profits in the short run. What is to be taken into account in this context, is the benefit of employees and the benefit of all subjects whose material position depends on the company activity. In this sense ethical behaviour and social responsibility is equalized. Decline in the individual life quality and dissatisfaction of employees and customers will result in harmful consequences in terms of the firm's image and its business future.[14]

Acceptance of general ethical standards and behaviour in accordance with them contributes to the efficiency of the economic system of a country in transition, and its inclusion in the global market. In spite of this, it is still believed in some transition countries that enhancement in these terms leads to unjustifiable costs. The consequences of such beliefs and behaviours are often loss of market image, market share, and bankruptcy.[15]

Practical application of business ethics and awareness of social responsibility are not just principles or document formed as an ethical behaviour codex. It is rather a complex system of routine operation and communication with the environment. The future development of employees and their efficiency depend on this system, as well as the operation of the firm as a whole. The operation model has to be adapted to the firm's environment and its business activities, and it has to be implemented in all its operational functions.

Ethical business operation and acceptance of the modern standards of social responsibility contribute to the trust in the better future, especially in the moments of crisis. Critical periods can be used to strengthen the team spirit, to motivate the workforce and to promote a positive image of the firm. On a wider social scale such behaviour will promote competitiveness and represent a significant civilizational achievement in the business sphere.

[15] Šerić, N., *Importance of remodeling of marketing strategies for the market in the countries in transition,* 5th International Conference Enterprise in transition, Ekonomski fakultet Split, Split 2003.

In application of ethical principles in practice, various organizational mechanisms are nowadays used in transition countries markets. Their aim is to promote corporate ethical culture. Besides, these principles contribute to creation of organizational environment that will stimulate ethical decision making and employee behaviour. The results of such mechanisms may not always be ideal, as each any basic ethical principle has its advantages and disadvantages. *Benefits, law* and *justice* cannot always ensure the decision platform that will be ethically desirable.

Operation in the long run is always linked with ethical principles. Intensification of any effort in these terms will guarantee the market survival of the firm. Eventually, business ethics and ethics in general is a civilizational achievement on which life quality is heavily dependent today and in the future.

Acceptance of high ethical standards in business is a complex organizational task in the modern business practice. Various groups within the firm can have different opinions on the level of necessary standards. Harmonization of attitudes is most appropriate in the basic postulates. Factuality and truthfulness are to be respected, and justice has to be striven for in relations between market subjects and their environment. On the other hand without mutual respect and acceptance of differences there can be no ethically motivated business. Without it there is neither long-term perspective of market survival. The platform and application model described in this work serve for that particular purpose.

1. INTRODUCTION

Technological change affects the demand for skills across all economic sectors during transition. In advanced OECD economies technical change has brought about a general 'upskilling' of the workforce (Machin, 2001; Berman, 1994). The introduction of new technologies has involved an upward shift in the demand for skilled labour, leading to a widening skill-wage differential and an increased share of skilled employees. This effect has become known as 'skill-biased technical change'. It tends to occur 'within sectors', as opposed to the 'between sector' shifts following structural change in the economy, and most productivity growth in the transition economies of Eastern Europe between 1995 and 2000 came about as a result of changes within sectors rather than shifts between sectors (Landesmann et al., 2004).

Skill-biased technical change has been intensified by the advent of globalisation and increase of competition. Countries with comparative advantage in skilled labour have specialised in goods with high skill content, raising demand and wages for skilled workers. At the same time cheap imports from less developed countries have undermined the labour market position of low-skill workers. In less developed countries an opposite effect is taking place and a process of deskilling, and an increased demand for unskilled labour, can be observed as a counterpart. Some less developed countries have begun to bridge this gap by investing intensively in human capital. Transition countries might fall into either group – the group of upskilling countries, or the group specialising in low-skill sectors. The outcome depends upon both initial conditions (the level of development and the extent to which a country had an initial comparative advantage in skilled labour) and the path of transition itself (how fast

restructuring takes place so that new high skilled industries can be retooled and become competitive on the global market).

Croatia began its transition in the late 1980s in a favourable position, with a highly skilled workforce in industries that traded intensively with the EU. Together with Slovenia it was one of the most advanced republics of former Yugoslavia. When the country broke up the more advanced regions were more easily able to integrate themselves into the global economy. The experience of Slovenia demonstrates how this process can enable a country to progress and develop on the basis of upskilling its workforce, and integrate into the EU on the basis of high-skill industry specialisations (such as in motor car components manufacturing). Croatia was in a position to follow the example set by Slovenia, but the war period in the early 1990s set the country back and many of its industries lost their connections with the international market. The development and technology gap between Croatia and Slovenia has subsequently widened.

These considerations suggest that there is nothing automatic about a country adopting a process of skill biased technical change. Transition countries may follow two feasible paths: a high technology path and a low technology path. Along the first path, favourable initial conditions followed by a speedy restructuring combined with preservation and growth of human capital may lead to a rapid recovery and growth catch-up with the EU economic average. The second path is characterised by unfavourable initial conditions and political instability leading to a slow pace of transition and restructuring. Along this path, transitional recession characterised by deindustrialisation and mass unemployment can be prolonged, leading to deskilling and the loss of human capital. This latter effect is amplified by civil conflict, which promotes the emigration of skilled workers and a further loss of human capital through a 'brain drain'. Transition countries that follow this path can be expected to have weak demand for skilled labour, and specialise in export of low-skill goods. They are less likely to attract FDI, partly due to the weakness of the skills base of the labour force, and this in turn may undermine the process of skill upgrading.

How can countries which have favourable initial conditions, and yet have been for some time caught in the second path of low-skill transition switch track and pursue a more socially responsible path of high-skill development and increased productivity based on investment in high technology and continuous innovation? The mechanisms of knowledge transfer to both established and new small businesses are especially problematic in countries where the legal system does not fully protect intellectual property rights, where trust relations are weak, where foreign direct investment is low, and where large domestic enterprises are protected from the force of market competition. In such circumstances there will be low levels of knowledge transfer and innovation. Recent research into national innovation systems has shown that differences in innovative capacities between countries are to a great extent linked to the institutions which promote learning and technology transfer (Brazcyk et al. 2000, Piech and Radosevic, 2006) and furthermore on the existence of networks of institutions and firms that permit reciprocal exchange of knowledge and information (Morgan, 1997). Such knowledge transfers are facilitated by flexible interaction between research institutes, university science departments and industrial enterprises.

In this paper we investigate the case of a transition country, Croatia, which is seeking adequate policy options that would shift her from comparatively lower-skill development and human capital towards the path of a high-skill knowledge-based economy. In section 2 we start by reviewing the institutions which have recently been established in Croatia to facilitate

knowledge transfer and innovation, followed by a review the innovation capacity of Croatian economy. We identify the main strategic directions of research and technology policy, and identify some weaknesses in policy implementation. In section 3 we explore some of the reasons for the low effectiveness of knowledge transfer policies. Section 4 draws some conclusions about the role of institutions in promoting knowledge transfer and innovation, and the mutual roles of government, academic institutions, and the business community in implementing such policies effectively.

2. KNOWLEDGE TRANSFER POLICIES IN CROATIA

Croatian analysts and policy makers frequently point out the gap between the relatively well developed public research sector and the needs of the business community. The transfer of knowledge from universities and research centres towards the business sector and in particularly towards SME sector remains rather modest and there is an ample scope for improvements in this area. The Government has already taken number of measures towards that end. As the recently published Competitiveness Study concludes, Croatia needs to develop a more ambitious innovation and research policy and improve the transfer of knowledge especially towards technologically most dynamic enterprises. EU accession should significantly contribute to the process of expanding the technological base of the country, not only by introducing mechanisms for stimulating R&D activities but by creating a framework for the cooperation of Croatian companies with EU partners that could result in a significant transfer of new technologies. Without doubt, the demand for the technology and knowledge-based services from industry is expected to expand in Croatia as competition becomes stronger.

Croatia has already set the basic institutional framework to support knowledge transfer between science and business. It consists of a strategy and a policy of scientific and technological development, and an innovation policy, all of which underpin the legislative framework, the institutions and the organisational structure which enforce and implement the policy. Linkages between these elements of SME policy, the innovation system, and the emerging knowledge economy in Croatia are needed to underpin a successful transition to a path of high skill, high-technology, knowledge based economic development (Svarc, 2006). However, as in several other transition economies, there are many deficiencies present in knowledge intensive services, financial systems and available labour skills, which are serious structural problems in transformation towards the knowledge-driven economy and society (Peich and Radosevic, 2006).

In Croatia the national research and technological policy is the responsibility of the Ministry of Science, Education and Sports. The Government has defined its policy for science and technology development in the "*Strategy for Development of Science in the Republic of Croatia in the 21st Century*", adopted in 2003. In October 2006 the Ministry of Science, Education and Sports (MSES) adopted a further document on the "*Science and Technology Policy of the Republic of Croatia, 2006-2010*" which serves as the basic framework and vision for research and technology development for the next five years and assigns the budget necessary for the implementation of the policy[1].

---

[1] For details see www.mzos.hr with the full text of the Science and Technology Policy, 2006-2010.

In 2004 several activities were started to strengthen the Croatian National Innovation System (NIS) by establishing new institutions and strengthening the capacity of existing ones. The institutional framework was enriched by the establishment of the Croatian Accreditation Agency in 2005 whose activities were previously scattered among different institutions. The reorganisation of the Croatian National Innovation System was carried out as part of an effort to align to EU practices and the general institutional adjustment process towards the EU.

In the last five years the Ministry has carried out various activities to assist innovative technology development. In May 2001 the HITRA[2] programme (Croatian Programme of Innovative Technological Development) was started by the Croatian Ministry of Science and Technology, aiming to enhance cooperation between science and business sector on new technology development. The main mission of HITRA was to enhance the commercialisation of innovations and to transfer knowledge on technological innovation from academic research centres to the enterprise sector. Most of the registered innovations in Croatia have remained within the academic community without testing their commercial possibilities, holding back the technological development of the economy. The HITRA Programme aimed to bridge that gap so as to increase the innovation performance of the Croatian economy.

The Programme was implemented through two technology projects known as TEST and STRIP (for developing early stage simple and complex technological projects) mainly directed to the academic community, and the sub-programme RAZUM directed to enterprises which use new technologies developed in cooperation with Croatian scientific research institutions. In 2005 the TEST and STRIP projects were combined into a single Programme called JEZGRE which aims to enhance R&D resources in industry and to increase the employment of young scientists in industry. In 2006 about 2.8 million Euro has been secured by the State Budget for implementing the programme, but the rest of needed funds is to be financed through the public-private partnerships. [3]

RAZUM was redesigned in early 2005 and re-launched by the Business Innovation Centres Network (BICRO)[4] as and Innovation Commercialization Programme through three new projects including (a) VENCRO, which finances new hi-technology start-ups through a venture capital fund supported by a €31 million World Bank loan[5] approved in 2005, (b) TECHPRO, which assists established hi-tech firms with funding for new technology and business infrastructure and which also funds new technology and innovation centres and incubators, and (c) Product Quality Facility (PQF) projects aimed to improve competitive capacity of existing SMEs in order to increase their access to new technology knowledge and management skills.[6] RAZUM is based on the support from Croatian Bank for Reconstruction and Development, Ministry of Economy, Labour and Entrepreneurship and the Fund for Development and Employment, as well as the World Bank Science and Technology Policy (STP) Loan. The Programme will combine the budget of €86 million coming from public funds and about €20 million coming from the private sector.[7]

---

[2] For details see on HITRA projects see www.mzos.hr.
[3] Science and Technology Policy of the Republic of Croatia 2006-2010, Ministry of Science, Education and Sports, October 2006, p. 28.
[4] BICRO was founded in 1998 by the Croatian Government decision - see www.bicro.hr.
[5] BICRO received €14 million.
6 For details on the World Bank loan see Project Information Document at www.worldbank.hr.
[7] Science and Technology Policy of the Republic of Croatia 2006-2010, Ministry of Science, Education and Sports, October 2006, p. 28.

In 2006 two additional programs of BICRO were launched: IRCRO which provides incentives for Research and Development activities of the SMEs through the business cooperation with academic organizations and KONKRO which aims at activities which improve business competitiveness at different levels (product quality, design, productivity, ISO standardization of products, patenting procedure, environmental protection, etc) and is much wider in its scope than the pure focus on quality of the products within the PQF program. IRCRO is jointly funded by the Program and industrial company on the bases of 50:50 grant scheme. A total of €1.5 million has been secured in the State budget for implementation of this program until the 2009. KONKRO Program is also envisaged to be financed by the State budget with a total of €1.5 million by 2009.

Established already in 1997, BICRO's mission has been to link innovative business firms with R&D at universities and financial institutions, offering seed capital and various innovation schemes. BICRO has been responsible for implementing the government's programme for the creation and development of knowledge-based small and medium enterprises, drawing also on regional and local funding. BICRO also relies heavily on regional Technology Innovation Centres whose activities are also supported by government funds. Since 2004 the activities of the BICRO Network has been supported by the Ministry for Economy, Labour and Entrepreneurship (MELE) through the Projects for Innovators. In 2004 MELE launched a special loan programme to provide incentives for SMEs with projects for buying new technology and equipment. About 111 such loans were disbursed, totalling €15.9 million (Singer and Lauc, 2004: 25). MELE also supports programmes stimulating development and growth of technology-based SMEs by encouraging individuals to establish their own companies as well as the development of innovation clusters (*Cluster Development Programme*) to boost competitiveness.[8]

However, all these programs are limited in size and rather bureaucratic in their procedures. Moreover, according to the Croatia Enterprise Policy Performance Assessment (OECD, 2005) support programs in Croatia for crafts and SMEs lack adequate tax incentives for investment in advanced technology and knowledge-based production and services, although special tax benefits for R&D expenditures in the private business sector were introduced in December 2003. Such costs are actually deductible twice: first as deductible expenditures when taxable profit is calculated and secondly as a reduction of already calculated taxable base for corporate income tax (CIT). The R&D tax incentives should encourage a considerable increase in research and development in Croatia if the regime is administered in a non-bureaucratic manner.

Initial pilot comparative analyses of Croatian National Innovation System and EU-member countries based on the benchmark methodology (Svarc and Becic, 2005), show that Croatian NIS is lagging behind the average EU-25 in all four components of the innovation system: a) research intensity; b) intellectual capital levels; c) technological and innovative capacity and d) enterprise innovation absorption capacity. Therefore there is still ample scope for adjustments prior to accession to the EU.

2.1. Innovation capacity in Croatia

Innovation capacity could be broadly defined as the capabilities of a society for innovation and technological progress (Freeman, 2002). In Croatia, total expenditure on R&D over the

---

[8] For more information see www.mingorp.hr.

last five years has been at just above 1% of the GDP (1.14 % in 2003; 1.21% in 2004[9]), which is still rather inadequate both in terms of scope and structure.[10] The total level of expenditure on R&D in Croatia is lower than in neighbouring Slovenia and the EU-15, but above the average of the new EU member states[11]. R&D expenditure by the private sector is relatively low compared to the EU-15 countries (CEC, 2004a): the private sector spends just 0.45% of GDP on R&D compared to 1.30 % of EU-15.[12] and employs relatively few researchers - in Croatia the private sector share in total R&D employment is at about 19%[13], compared to 56% in the EU-15. Among the new member states only Bulgaria has a lower share of researchers employed in the private sector than Croatia.

The Croatian research system consists of seven universities, 26 public research institutes, 13 private scientific institutions, 11 research centres in the industry sector, 16 public schools of professional higher education, 16 accredited private colleges and polytechnics, one military research centre, and six technology and research and development centres.[14] It is generally considered that knowledge transfer from universities to SMEs is underdeveloped in Croatia. According to a recent European Commission report "there is insufficient co-operation between business and universities and other public research institutions" (CEC, 2006). Moreover, Croatia has continued to have a below-average rate of knowledge transfer from its universities and research centres to its private enterprise sector as compared to EU-members.[15]. Compared to the main EU competitors, Croatia's position is rather weak and links between academia and industry are inadequate as measured by access to research, subsidies for acquisition of new technology, and support for engineers and scientists for commercialisation of their ideas (Singer and Lauc, 2004). According to the most recent Competitiveness Report, Croatia needs to develop more ambitious innovation policy to encourage knowledge transfer towards technologically dynamic enterprises. However, EU accession may eventually promote the expansion of the knowledge base, by stimulating R&D activities and the cooperation of Croatian companies with EU partners could result in a significant transfer of new technologies.

A recent survey of the European Commission[16] (2005) has measured the capacity for innovation and revealed indicators for assessment of this capacity in EU members and 4 South East Europe countries (Bulgaria, Romania, Turkey and Croatia). Croatia seems to be attracted to the innovation of new services and products a bit above (40%) the average 39% of the sample, showing rather good potential of the population for the innovation which is important drive of the competitiveness of the enterprise sector. However, it is important to mention that Slovenia, Luxemburg, Malta and Slovakia belong to the group of highest innovation enthusiasts (together with Turkey and Romania), giving them larger chances to materialise their innovation capacity, which means that comparatively Croatia's position is

---

[9] *Statistical Information* 2006, State Bureau of Statastics,Zagreb, December 2006, p. 36; www.dzs.hr

[10] Also it is time that the official statistics consider this not as an expenditure but as an investments.

[11] Annual Report on Competitiveness of Croatia, 2003-2004, National Competitiveness Council, Zagreb, 2005.

[12] Annual Report on Croatian Competitiveness 2003-2004, Croatian Competitiveness Council, 2005.

[13] Some estimates are even lower than those of National Competitiveness council i.e. 17% (Svarc, J. 2005)

[14] "*Science and Technology Policy of the Republic of Croatia, 2006-2010*" Ministry of Science, Education and Sports, October 2006, p. 10.

[15] According to the GEM 2005 report (p. 52) the average score for Croatia is 2.06 (out of 5). The conditions in the knowledge transfer from academia to business have during the period 2002-2005 stayed around more or less unchanged, which is not a good news, as this is very important component for entrepreneurial development. Croatia is ranked at 24th place among 35 countries covered by the survey in 2005.

[16] Population Innovation Readiness, *Special Eurobarometer*, European Commission, August 2005.

weaker in the longer run. The data from the first innovation survey (2004) of Croatian enterprises are discussed in detail below.

2.2. Knowledge transfer through spin-offs and clusters between academic organisations and business

In recent years universities in many industrialised countries have begun to set up programmes to encourage academics and students to establish spin-off companies to commercialise the results of scientific inventions made within the academic laboratories. Such companies are typically small high technology companies. The commercialisation of scientific research through spin-offs is a direct means of transferring knowledge from higher education institutions to the SME sector. A number of empirical studies of spin-off experiences in various European countries have begun to identify some key issues for policy makers keen to encourage spin-off activity. As with SMEs in general, only a small minority will have a high growth potential and offer a high return to the originating institution. University based start-ups and spin-offs are high-risk ventures and face many difficulties. Typically, spin-offs may find it hard to rise outside equity capital or loan funds to finance their activities (Lerner, 2005). Equity investors are reluctant to invest because of information asymmetries between the academic entrepreneur and the investor. Banks may be reluctant to invest because of adverse selection problems (high risk-adjusted interest rates discourage all but the most high-risk borrowers). Spin-outs also typically lack managerial expertise they need to develop the capabilities to exploit the commercial potential of their technologies (Wright, Vohora and Lockett, 2004). The latter difficulty can be overcome if spin-out companies form joint ventures with established companies. A further issue is whether research institutions are allowed to retain the right to patents in inventions that they make, and can legally commercialise the invention in the form of an innovative spin-out company. If they are not, and if they are constrained by restrictive regulations and bureaucracy there is even less chance that their spin-out activities will be successful (Lerner, 2005).

In Croatia, the spin off companies at universities and research institutes are still extremely rare phenomenon. One of the latest initiatives for establishment of a pilot spin-off high-tech company was explored in 2004 at the Institute Rudjer Boskovic (IRB), envisaged as a joint venture with foreign partners. The World Bank supported restructuring program of the Institute called Science and Technology Program (STP) which aimed to develop IRB's long term Business Plan (2004-2008) which includes four pilot commercialization initiatives. [17] The spin-off firms will try to launch the applications of the commercially viable innovations based on venture-capital investment.

The National Competitiveness Council of Croatia has also listed these policies for SME development in its "55 Recommendations for Raising Croatia's Competitiveness" (2004). The Croatian Government has issued a tender to provide grants of between €400 and €10,000 to promote clustering activities covering costs of business plans, studies, joint market approaches, development of ICT and databases to facilitate clustering. So far, there have been few projects initiated, including two in the furniture industry (Zagreb and Vinkovci) and the other one in the metal industry in Osijek (Singer and Lauc, 2004). The Croatian Wood Cluster was initiated in 2002 also with the assistance of USAID and has 20 members, while the Vinkovci Wood Cluster has 15 members and was initiated in 2004. The metal industry cluster was initiated in Osijek in 2003 and promotes cooperation between a growing mid-sized

---

[17] For details see IRB Annual Report 2003 and 2004 at www.irb.hr.

company and 15 smaller ones. According to the latest data from MELE there are 29 innovation-production cluster initiatives that got support from the Ministry in total amount of 657,557 HRK.[18]

2.3. Technology transfer centres and incubators

There are five Technology Transfer Centres in Croatia: TIC Rijeka, Technology Development Centre Osijek-TERA; TIC Split; Technology Transfer Centre Zagreb and Research and Development Centre for Mariculture Ston (CEC, 2006). Four of them were established by the Ministry of Science, Education and Sports (MSES) and with support by local community. MESE supports the operation of these centres only through co-financing operational costs (overheads), The Ministry of Economy, Labour and Entrepreneurship (MELE) also supports projects for start-ups and innovation through these centres.

Technology park initiatives have been also growing (EPPA, 2005) and there are now several innovation centres and technology transfer centres.[19] Among them five institutions could be considered as genuine technology parks: Technology Innovation Centre Rijeka; Technological Park Zagreb; Technological Centre Split; Technological Park Varazdin and the Centre for Technological Development Slavonski Brod. The first technology park was Technological Park Zagreb (TPZ) founded in 1994 as a combination of a technology park and a business incubator. Its main aims are to support business start-ups, advise entrepreneurs, provide business education and training, deliver project management and introduce quality certifications such as ISO 9000. It has 1,300 m² of business premises and about 300 - 500 clients. Half of its operating budget comes from the municipality and the remainder from its commercial services such as renting space and facilities to other entrepreneurs. The TPZ represents the largest concentration of entrepreneurs in the area of high technology development and innovation in Croatia. Out of 39 high technology private sector tenants, 21 left after successful incubation, while 18 are still incubating in the Technology Park. The firms that entered the Park have enjoyed impressive business growth and after leaving have on average 15 employees. Between 2001 and 2003 the firms within the TPZ developed 104 new products as a result of own technological innovations which have all been commercialised. In the course of 2004-2005, 88 new products were developed.[20] The TPZ gained an ISO 9001:2000 Certificate in 2002, and nine of the TPZ firms have also received a Certificate.

As for business incubators development, the Government policy has achieved some good results since 2003. Several new business incubators were established in 2003-2005 as a result of the "Special Funding Programme for Enhancement of Development of Business Incubators" initiated by the former Ministry of Crafts, Small and Medium Entrepreneurship. In the 2006 Budget a total of HRK 6 million is envisaged for incentives for the operation of Business Incubators.[21] The business incubators are often part of other SME support institutions, such as entrepreneurship centres and technology parks[22]. According to the OECD (2005) there are about twenty business incubators out of which fifteen are fully operational, while the latest European Charter for Small Enterprise Annual Report for Croatia puts the

[22] The small business community claims that information on business incubators is not readily available and the services they offer are not sufficiently specialised.

number at sixteen (CEC, 2006). Business incubators are also established as students' initiatives (for instance at the Faculty of Electrotechnics Zagreb). In 2004 the Government adopted a "Programme to Encourage the Establishment of Students' Firms" and provided funding to promote such initiatives in secondary schools. The development of business incubators is constrained by the lack of adequately trained and experienced staff. Appropriately qualified incubator managers, combined with adequate financial support, are important factors for the success of such programmes to encourage business incubators. The impact of business incubators is also diminished by the lack of suitable follow-up and absence of plans for tenants vacating at the end of the contract period.

2.4. Mobility of researchers

Mobility of researchers between academic and business organisations in Croatia is still rather low. Most of the research resources are positioned in public research organizations and universities. This is a result of the process that started at the beginning of 1990s when most of industrial research organisations were closed as a part of the severe restructuring process that industry has gone through in Croatia. According to latest 2006 data, in the total human resources in the R&D sector, there are 3,232 Masters of Science, 5,780 Doctors of Sciences and 1,982 other researchers. Industry and private companies employ 2,703 Masters of Sciences and 976 Doctors of Sciences.[23] The Croatian Ministry of Science, Education and Sports supports the employment of young scientists in R&D in industry within the Program JEZGRE since 2005. This was recognized as a most critical issue of future economic development resources. Namely, according to the available data at the Ministry, the share of young PhD holders in technical and natural sciences in total employment in the age group 25-34 is only 0.17% in Croatia as compared to 0.55% on average in the EU (and 0.97% in Finland). Also, there is only 17% of total number of researchers employed in R&D in industry sectors, while the developed countries employ predominant share of 70% of total researchers.[24] The Program JEZGRE envisages help to R&D industry centres by providing financial assistance for employment of young MA and PhD scientist in the industry for a period of four years.

2.5. SME policy and knowledge transfer --innovation policy among SMEs

The statistical surveys on innovation capacities which are the usual methodological tool in assessing innovation capacities in the EU member-states are rarely carried out in Croatia. The first statistical survey on innovation activities in the enterprise sector in Croatia was conducted in 2004 by the Institute of Economics, Zagreb on a sample of 3,749 Croatian enterprises, out of which 567 enterprises provided the requested data. The survey measured the frequency and intensity of innovation activities, as well as their sources and obstacles for them in Croatia. It was conducted on the basis of the standard EUROSTAT methodology of Community Innovation Survey (CIS3).[25] The survey[26] revealed that about 54% of production enterprises carried out innovation activity relatively frequently in the 2001-2003 period. As in Slovenia (and elsewhere in the EU), the survey revealed that most of the innovations take

[25] The summary of the main results is available in *Innovation Focus* /Inovacijsko žarište/, (2005), Vol 2.No.6. Croatian Ministry of Science, Education and Sports.
[26] For details see Račić, D., Radas, S., and Rajh, E. (2004). Innovation in Croatian enterprises: preliminary findings from community innovation survey. *Proceedings of the 65th Anniversary Conference of the Institute of Economics, Zagreb* / Švaljek S. (ur), Zagreb, p. 403-427.

place in larger companies rather than small companies. The same pattern is confirmed by the Croatian survey since there is a much higher share of innovating firms among those with more than 250 employees (Racic, Radas and Rajh, 2005).

Table 1 : Percentage of innovating firms in Croatia related to size

Firm size	Both product and process Innovative	Only product Innovative	Only process Innovative
0-9	36,33%	30,04%	24,12%
10-49	49,74%	40,84%	36,32%
50-250	57,61%	49,45%	41,30%
>251	76,32%	63,16%	63,89%

Source: Racic; Radas and Rajh (2005)

However, the effects of such innovations are relatively low as they are inadequately reflected in advancement of the production processes. Furthermore, a very worrying survey result is that the enterprises in services record especially low levels of innovation activity. The general effect is that innovation is placed rather low in their business plans and strategies and therefore on could expect inadequate effects on the rise of the long term competitiveness of the Croatian enterprise sector. As for the sources of information for innovations, most Croatian enterprise use fairs and exhibitions (11.6%); suppliers of the equipment (11.2%), as well as professional conferences, meetings and journals (11.1%). The survey revealed that Croatian enterprises give very low importance to the Universities and research organizations and institutes as a potential source of information, which similarly to Slovenian survey indicates rather week cooperation, knowledge and technology transfer between research and business sectors (Racic; Radas and Rajh, 2005). The Croatian firms identify the main obstacles for innovations to be: a) lack of information concerning the potential market (13%); b) lack of information concerning technology (12 %) and c) lack of customer responsiveness and interest in the new goods and services. All of them seem to be marketing related which indicates a rather low level of innovation expenditures allocated towards marketing of new products. The survey also revealed that insufficient support from the state is perceived as the least important obstacle to innovation.

3. BUSINESS STRATEGIES, DEMAND FOR SKILLS, AND TAKE-UP OF KNOWLEDGE TRANSFER POLICIES

Why have the extensive knowledge transfer policies in Croatia been relatively ineffective? And why have SMEs in particular displayed such low levels of innovative activity? In this section we argue that the SME sector in transition economies (and the business community in general) may follow two alternative strategies of investment and growth. One, a low-skill, low-tech strategy is aimed to take advantage of relatively low labour costs as a means to achieve competitiveness on the domestic and international markets. The other, more socially responsible strategy is to invest in labour force skills and in new innovative technologies, to boost competitive strength on the markets by following a knowledge-based approach to business development. We argue that the Croatian business community has been slow to adopt the high-skill strategy and has up to now relied predominantly on a low-skill strategy, although there are signs that this is beginning to change. Businesses which rely on low-skill

strategy of development can be expected to have little interest in taking up the opportunities for collaboration with research institutions and universities. Therefore, the explanation for the low take-up and low effectiveness of knowledge-transfer policies lies just as much on the "demand side" with the potential business partners as it does on the "supply side" of the relationship, or in the design of the policies and programmes.

At the onset of transition, Croatia inherited a well developed education system. However, the system was created to serve the needs of a heavily industrialised economy, focused on developing a narrow range of skills designed to equip workers for specific tasks in the workplace. Little attention was paid to education in transferable skills as it was expected that workers would have a job for life in their chosen industry. Few people were educated in the skills needed in a fast-changing market economy. Adult education was also insufficiently developed, and workers made redundant from privatised or state firms undergoing restructuring were disadvantaged in the labour market. Economic restructuring combined with traditional vocational training left many unemployed blue-collar workers with obsolete skills (Cazes and Nesparova, 2003). In OECD countries, as observed above, a process of skill-biased technological change has resulted in an increasing share of skilled white-collar workers in employment in most advanced western countries. As can be seen from Table 2, this process has not yet taken hold in Croatia. The data show that there is a relatively low share of highly skilled non-manual employees in Croatia – just 28% compared to 39% in the EU-25 - and a significantly lower share than in Hungary and Slovenia. The share of high-skill non-manual employment in Croatia is lower than in all the other countries except Romania.

Table 2: Employed Persons aged 15 and more by occupation in their main job, 2005 (%)

	Highly skilled non-manual	Low skilled non manual	Skilled manual	Elementary occupations	All employment
EU-25	38.6	24.9	26.8	9.7	100.0
UK	41.0	30.9	17.4	10.6	100.0
Slovenia	37.8	20.0	35.8	6.4	100.0
Hungary	34.3	23.7	33.7	8.3	100.0
Croatia	28.4	25.7	38.2	7.7	100.0
Romania	20.9	13.8	54.8	10.6	100.0

Source: Jouhette, S. and Romans, F. (2006) EU Labour Force Survey Principal Results for 2005, EUROSTAT Statistics in Focus, Population and Social Conditions 13/2006

Figures 1-4 show the evolution of the structure of skills and occupations over time. The data are taken from the ILO Laborstat database[27] and cover the period from 1998-2005. Figure 1 reveals that in recent years the proportion of blue collar workers in employment in Croatia has increased more rapidly than the number of white collar workers, indicative of a low-skill strategy of business growth. Only recently, since 2004 has this pattern begun to reverse and the proportion of white-collar workers to increase. The increased share of blue-collar workers in employment after 2000 is of some interest as it appears to go against the global trend towards an increasing share of white-collar workers. Furthermore, Figure 2 shows that the proportion of unskilled workers in employment in Croatia has increased more rapidly than the

---

[27] Data on occupational categories is available for several countries on the basis of the ISCO-88 standard classification. The classification provides ten broad occupational categories. These can be further aggregated into broad skill categories. ISCO-88 uses four skill levels which are partly operationalised in terms of the International Standard Classification of Education (ISCED) and partly in terms of the job-related formal training. According to this classification, the highest skill level is associated with professional occupations, the second highest with technicians, the lowest with elementary occupations (unskilled workers) and the rest form an intermediate 'third' level of skills.

number of skilled workers between 1999 and 2004 (the proportion of skilled employees decreased from 57% to 55% of the employed labour force).

Figures 3 and 4 present the changes in skill proportions within the group of blue-collar and white-collar employees separately. They reveal that there has been relatively little change within the group of blue collar workers between skill groups. The proportion of skilled blue-collar workers in employment fell marginally from 60.6% in 1999 to 59.9% in 2005. A similar picture emerges considering the changes in skill mix within the white-collar group. A noticeable reduction in the proportion of high-skill white-collar employment took place between 1999 and 2001, but this was reversed by subsequent increases in the share. Overall there is no evidence of skill-biased technical change in Croatia and the overall impression is one in which little structural change is taking place. If anything, a tendency towards a low-skill, low-technology path of business investment and economic development is revealed by these data.

4. CONCLUSIONS

This paper has investigated the policy and institutional framework to support improved links between research and higher education institutions and the business community in general and the SME sector in particular. Policy makers in Croatia have succeeded in establishing active programmes of knowledge transfer along almost all relevant dimensions and are putting more and more emphasis on that area, especially in the last few years. Yet, doubts remain as to the effectiveness of these programmes in fostering knowledge transfer between research institutes, universities, and the private sector (Singer and Lauc, 2004; GEM 2002-2005 Report, 2006). The policy outcomes of the innovation and knowledge transfer between academic and business organisations in Croatia are still rather modest and there is ample scope for improvements in this area. Policies to support technology parks and business incubators have failed to generate much spin-off activity. Despite many policy initiatives spin-off activity is weak, and the performance of the science parks and business incubators is poor. Technology parks and incubators suffer from lack of support, weak protection for intellectual property and bureaucratic management.

What are the reasons behind these inadequate policy results? In seeking an answer to this question we have focused attention on the skills of the workforce. We contrast two possible strategies of business development in transition economies such as Croatia. The first low-skill strategy relies on the use of low-skill, low-cost labour, and on cost reduction through the substitution of unskilled labour for high-tech capital. The second, high-skill strategy is a more socially responsible business strategy which emphasises high-skill, high-technology investment, improved innovation and knowledge transfer with employee-friendly working

486

conditions. Both approaches are capable of contributing to improved international competitiveness, but have different implications for the success of knowledge-transfer policies and for the improved competitiveness of the Croatian economy in the long-run. Businesses which focus on the low-skill approach to investment are likely to display little interest in successful collaboration with research and higher education institutions for knowledge transfer. Although this may be a successful short-term strategy, in the long run with increased global competition and increased integration into the EU economy, this type of strategy is unlikely to be sustainable. The second more socially responsible type of business is likely to have a far greater interest in successful and effective collaboration with knowledge-transfer programmes and policies. Businesses which focus on this type of strategy are far more likely to build up the adaptable business competencies which will be the key to success in the competitive EU and global markets of the future.

In the early years of transition in Croatia, effective restructuring and the adoption of new technologies was delayed by an emphasis on insider privatisation, and on the partial privatisation of formerly socially owned enterprises. At the same time the entry of new small private firms which form the bulk of the SME sector has been slow, and subject to many institutional barriers (Cuckovic and Bartlett, 2007). More recently, entry barriers are being lowered and improvements in the business environment are reducing barriers to SME growth. As employment in SMEs increases closer to EU levels, the demand for labour from the SME sector is likely to change. Some SMEs will prosper in high-growth, high-technology sectors which will have large demands for skilled labour; other SMEs will be located in low-skill sectors such as retail trade and low-skill services. Which of these patterns predominate will depend upon strategic decisions by individual businesses to follow the path of high-skilled, innovation-intensive transition with linkages to sources of knowledge transfer whether public (local universities and research institutes) or private (e.g. foreign companies investing through FDI inflows in new technologies in Croatia).

In the coming years the pace of restructuring is expected to speed up in response to the pressures of the EU accession process, the pressure of increased market competition, and the effect of increased inflows of foreign direct investment. As Croatia has become more open to foreign investment, and as market competition has become more intense from imported goods, more and more companies are likely to turn to a strategic approach to restructuring, investing in new technologies and becoming competitive on international markets. The government has a role to play in enhancing the adoption of these new technologies, in promoting the transfer of knowledge to the business community to boost innovation, and in encouraging companies to invest in employee skills. Science and technology policy has a critical role to play in stimulating and facilitating the adoption and transfer of new technologies from universities and research institutions. More attention should be placed on building trust between the academic and business communities to overcome the inherent market failures in the process of information and knowledge transfer. The research institutes and universities need to become more flexible and open in order to overcome these difficulties and take advantage of the opportunities for the commercialization of research. This effect can be facilitated by the process of network formation, and personnel transfer between the academic and scientific communities and the practical world of business enterprise. In promoting these elements Croatian science and technology policy is moving in the right direction. In the future, increased inflows of FDI will increase the rate of technology transfer and Croatia needs to be able to capture the advantages of these flows by maximising local spillover effects to the domestic economy. Croatia's universities and research institutions have an important role to pay in ensuring that such spillovers are actualised.

487

Policies to promote domestic knowledge transfer through university-industry partnership to promote spin-offs should be further developed, and should attempt to forge links between local SMEs and incoming FDI investments. However, the business sector also needs to be more responsive to the policy initiatives of the government, and to make its own transition from low-skill strategies to high-skill knowledge-based strategies of business development.

THE MICROFINANCE MODEL IN POST-WAR BOSNIA AND HERZEGOVINA: A DEVELOPING COUNTRY POLICY REPRODUCING A DEVELOPING COUNTRY ECONOMY

Key words: *Microfinance, post-conflict, sustainable development, deindustrialisation, microenterprise.*

1. INTRODUCTION[1]

> "One recalls how Western professors (now senior colleagues of the current crop of advisors) went out to Japan and Korea during their rapid growth spurts, telling policymakers that they could expand ever so much faster if they would just liberalise their systems. They were politely received – and their suggestions ignored. Will the leadership in possibly stagnating postsocialist systems have the courage to follow similar nonliberal convictions?" (Lance Taylor, 1994: 48).

The commercial or 'new wave' microfinance model now constitutes the most important local strand of the neo-liberal political project that has uniformly shaped economic policy throughout developing countries since the early 1980s, and in the transition economies since 1990. With upwards of US$100 million of international funds channelled into establishing MFIs in Bosnia and Herzegovina (B&H) since 1996, the commercial microfinance model has been very deliberately positioned as the central policy component of its post-war poverty reduction and community-level reconstruction and development. Leading the way in B&H was the World Bank with its US$40 million Local Initiatives Project (LIP). Alongside LIP came a large number of other microfinance programmes involving other international agencies (EBRD, IFC, UNDP), bilateral bodies (KFW) and international NGOs (CARE). Importantly, almost all of the MFIs entering B&H chose to follow the market-driven operating rules now defined by the World Bank to be 'best practice' – this is to say that MFIs must above all else prioritize eventually becoming financially self-sustainable through 'earning their keep on the market'.

---

[1] An earlier version of this paper was presented at Economic Policy Research Unit (EPRU) Seminar "Balkan economies: Studies on Non-Standard Phenomena", September 26, 2006, UNITIC, Sarajevo, Bosnia and Herzegovina. Many thanks to those who subsequently provided comments on that paper. A version of this paper has been published in Dichter and Harper (2007).

The international community almost immediately began to classify the microfinance model in B&H as one of the most impressive international examples of microfinance 'best practice'. The World Bank rapidly registered its LIP programme as its best development programme in the country, and possibly its best microfinance programme worldwide. Microfinance lobbying bodies financially supported by the World Bank and (therefore) fully in agreement with its neoliberal policy perspective, such as the Warsaw-based Microfinance Centre (MFC), also began to pick up on and publicize the B&H experience right across the transition economies. And specifically with regard to the post-conflict reconstruction and development context, the very widespread feeling was that, as Nancy Barry of Women's World Banking put it: 'Any war-torn country should look to Bosnia as a role model' (quoted in Dolan, 2005).

The aim of this chapter is to briefly examine the microfinance model in the case of post-conflict B&H. Critically examining the available evidence and trends in the supposedly 'best practice' case of B&H should help to begin to separate the hard reality from the hype and rapidly proliferating myths surrounding the supposedly awesome power of microfinance in both transition and developing countries alike.

2. SOME BACKGROUND TO THE B&H ECONOMY

Following the end of the Second World War, the newly designated Socialist Federal Republic of Yugoslavia (SFRY), including the constituent Republic of B&H, immediately adopted a Soviet-style central planning model. For a number of reasons, the central planning model was abandoned in 1948. In its place came the system of 'worker self-management', a form of industrial democracy whereby each enterprise was turned over to its employees to be operated and managed in a broadly democratic fashion. Over the next two decades the Yugoslav economy boomed, becoming known as the Balkan 'Tiger' economy of its day. At the same time, the previously under-developed economy in the Republic of B&H also finally began to make significant progress.

By the 1980s the Republic of B&H economy comprised a mixture of many medium-sized and a small number of large socially-owned industrial units using modern technologies and able to export on a genuinely competitive basis to many countries, particularly to the Middle East. The share of export earnings from the four largest conglomerates based in B&H (Energoinvest, UNIS, Sipad and Hidrogradnja) accounted for up to 40 per cent of the Yugoslav total. At the industrial core of B&H was a very substantial military-industrial complex producing for the Yugoslav army and for export. B&H also had an agricultural sector composed of mainly small-scale family and semi-professional farming units that provided a high level of food self-sufficiency and important additional local income generating possibilities, since farmers could often combine their work on the land with paid work in the new modern factories springing up. B&H also possessed a growing privately-owned SME sector that was also in the process of beginning to react positively to new opportunities opening up in the 1980s.

The economy of B&H thus stood in a reasonably good position in the late 1980s to take advantage of the upcoming changes and likely advent of new technologies, innovations, investments and market opportunities. However, any sort of advance was very quickly brought to a halt by the break-up of the former Yugoslavia and the subsequent outbreak of conflict in 1992. A vicious civil war ensued for nearly four years, Europe's worst conflict

since the Second World War. When a peace agreement was concluded in late 1995 with the signing of the Dayton Peace Agreement (hereafter 'Dayton'), the now independent B&H was in a pretty desperate state. Much of the infrastructure was destroyed, many factories abandoned, unemployment was endemic, poverty was at very high levels and inequality had risen dramatically. Immediately following Dayton, the international community set into motion a major reconstruction and development package. On a per capita basis the financial package offered to B&H was to prove to be in excess of the Marshal Plan that helped Western Europe successfully reconstruct after 1945. Along with this generous financial package came technical assistance from the World Bank, IMF and various other foreign economic advisory teams that helped the new B&H government unroll the standard neoliberal package of policy reforms.

In spite of some initial progress, however, it was becoming readily apparent by as early as 2000 that the B&H economy was actually failing to recover. Looking behind the statistical anomaly of ultra-rapid GDP growth in the first few years after 1996, it was found that very little *sustainable* economic development had actually taken place since Dayton. The international development community in B&H finally began to sit up and take notice. In 1999 the EU/Bosnia-Herzegovina Consultative Task Force, a policy coordinating body established in June 1998 by the Council of the European Union, convened a working group to develop an urgent industrial policy response to the worsening situation. It was particularly worried about the rapid decline of the existing industrial sector and the collapse of the associated institutional fabric. Serious concern was expressed about the almost complete lack of new private industrial SMEs since Dayton. Local industrial policies had actually been emphasized by local experts for a long time before and after 1995, the Consultative Task Force noted, and also repeatedly emphasized by many international analysts at the time. But by and large the international financial institutions[2] considered such interventionist ideas to be anathema, and so blocked their adoption (and even their discussion). Overall no real substantive changes could therefore be made to the neoliberal policy framework within which B&H was expected to recover and grow into the longer term.

After the new millennium, the output of bad news increased exponentially. UNDP was bleakly reporting in its *Annual Report 2002* that the chances of sustainable economic and social development in B&H were now very minimal indeed, given that the population had effectively been, condemned to reliance on a grey, trade-based, unsustainable economy rather than a production-based one' (UNDP, 2002).

As international donor financial support was beginning to wind down, the head of the World Bank in B&H was forced to argue that the country actually now needed major *new* cash infusions (of around US$250-300 million a year) otherwise it was heading for an 'economic abyss' (*International Herald Tribune*, 18th February 2003). An in-depth analysis by the independent European Stability Initiative went into considerably more detail on the alarmingly negative economic and social indicators (European Stability Initiative, 2004). The US-based and US government financed Centre for International Private Enterprise (CIPE) was forced to concur with the direction and urgency of the European Stability Initiative's analysis, going on to note in its own words that economic policy in B&H had effectively led to:

---

[2] That is, the World Bank, and IMF, supported later on by their ideological affiliates the EBRD and the OECD through the multi-donor Investment Compact process.

> Bosnia going through a process of de-industrialisation on a devastating scale. The new private sector is dominated by microenterprises in trade and basic services, generating very little employment. Bosnia seems to be developing backwards: where once it manufactured jet aircraft, it now exports aluminium; where once it exported furniture and finished wood products, it now sells only raw timber. Outside of the larger cities, many Bosnians are abandoning the towns and returning to the land their families left a generation ago. Forced out of the formal economy, they scrape together a living through some combination of casual labour, informal trade and subsistence agriculture (CIPE, 2004)

Initial IFI predictions that by simply unleashing brute market forces in post-conflict B&H a sustainable recovery would quickly and automatically be vectored into place, thus proved to be as naïve and as wildly inaccurate as in the rest of post-Communist Eastern Europe.[3] At the same time as most developing countries have been desperately trying to move up the value-added, technology and industrial ladders, after Dayton the still quite highly industrialized and technically sophisticated B&H economic structure was effectively allowed to collapse. What has been the contribution of the microfinance model (positive, neutral or negative) to this increasingly depressing picture?

3. THE MICROFINANCE MODEL COMES TO B&H

Very quickly after Dayton and with much fanfare, the international community launched the microfinance model in B&H. The microfinance model was very much seen as a 'quick-impact' poverty reduction policy that would provide a modest cash income to the 'entrepreneurial poor'. But it was also expected that it would play a crucial role in establishing both the growing enterprise population and institutional support foundations necessary for the longer-run 'bottom-up' sustainable growth and expansion of the local economy. In other words, an expanding microenterprise and SME sector was expected to gradually constitute the dynamic core of a revitalizing B&H economy.

Incorporating the microfinance model into the economic policy framework adopted by the first post-conflict government in B&H was not undertaken without some initial resistance, however. The microfinance model's intimate association with a range of developing countries that were all finding it difficult to point to obvious nodes of sustainable local economic development in the wake of significant quantities of microfinance, such as in Bangladesh and Bolivia, raised some real suspicion in B&H government and policy elite circles as to the likely outcome of the microfinance model in their country. The uneasy feeling was that perhaps the main international sponsors behind the microfinance model specifically had in mind for the B&H economy a similar non-industrial, largely informal economy-based future.[4]

---

[3] The 'transition depression' that rocked all of Eastern Europe after 1990, particularly severely in Poland, was a complete surprise to the IFIs, key western governments and their high profile international economic advisors (see Andor and Summers, 1998).

[4] This point was articulated a number of times during discussions the author had with senior government personnel, academics and local employees of several international organizations during a research visit in 1998, and then also in February, 1999, on the sidelines of a major conference on the microfinance model held in Sarajevo.

However, the international community's belief in the microfinance model seemed to be justified very quickly. Almost immediately after Dayton very many new microenterprises began to kick into operation right across B&H, a large number of them established with microloans from the first MFIs established with the support of the international community. The statistics began to corroborate what was becoming increasingly visible on the ground. In the immediate aftermath of the conflict, the number of enterprises rapidly expanded. Even in the latest time period - 2001 to 2004 – growth in the number of microenterprises and SMEs has continued apace, with a nearly 350 per cent increase in the number of microenterprises employing between one and five employees, while the number of SMEs (11-50 employees) increased by around 250 per cent (Ministry of Trade and Foreign Economic Relations, 2005).

The expansion of the microenterprise and SME sector in B&H has had a number of fairly distinct and inter-related characteristics. First, the overwhelming majority of new entrants were found to be operating in the informal sector. Nearly all of the new MFIs established from 1996 onwards began with a firm commitment to support only formal sector ventures, based on their understanding that an officially sanctioned expansion of a Southern Italy-style informal sector would constitute a negative development for B&H. When it became clear to the MFIs that they would simply not be able to achieve financial self-sustainability without extensively dealing with the informal sector, however, this requirement was quietly dropped (Goronja, 1999).

Moreover, confounding the early optimism that informalization was merely a temporary status and would disappear with increasing internal success and external regulation, it turned out that most informal sector ventures once started did not seek to become formal sector operations. For one thing, intense competition from other informal sector ventures could only be met by attempting to 'beat them at their own game', not by moving into formality and accepting added expenses and responsibilities (taxes, social contributions, adhering to health and safety regulations and so on). In recent years, the informal sector has strengthened its hold upon the B&H economy, with informal sector employment rising from 37 per cent of total employment in 2001 to 42 per cent in 2004, (World Bank, 2004) pointedly now bringing B&H more into line with the majority of developing countries.

Second, the overwhelming majority of new entrepreneurial initiatives established in B&H after 1995 have turned out to be very simple, easy-entry, no technology business ventures, particularly simple 'buy cheap and sell dear' type operations. In its first period of operation, for example, the World Bank's LIP client portfolio was dominated by small-scale trading ventures, making up 44 per cent of the total number of clients supported, amounting to 15,652 individual businesses supported (World Bank, 1999), while even higher proportions of petty traders were involved in most other MFIs operating in B&H.

Third, while the rate of microenterprise entry has been impressive, so too has been the rate of exit. Displacement effects were very high on account of the very simple and very similar business areas entered by most microfinance recipients, leading to intense competition, declining margins and exit for those least able to cope. The World Bank's 2005 evaluation of its LIP programme pointed out that 30 per cent of the microenterprises surveyed in 2002 had failed after just two years (Dunn, 2005). The World Bank-EBRD administered BEEPS Survey in 2005 found that after two years, 23 per cent of its original panel of SMEs could not be recontacted because they had closed down (EBRD, 2005).

In short, thanks to the significant infusions of international donor financial and technical support, the microenterprise sector in B&H was given a significant boost after 1996, and it subsequently expanded quite dramatically. The typical household in B&H now survives through a combination of subsistence agriculture alongside a variety of very small-scale informal sector activities requiring very little capital, technology, scale, skills or knowledge. The overall infantilizing trends in the B&H economy noted above are thus almost perfectly reflected in the programmed output of the microfinance model. In the next section we look at the all-important issue of causation. But what is for sure is that, howsoever it came about, the increasingly primitive economic structure in B&H is now very unlikely to lead to future sustainable growth and development. As noted above, this very fundamental point has been conceded by an increasing number of local and international organizations working in B&H.

4. THE MICROFINANCE MODEL AND ITS IMPACT IN B&H

The basic claim made for the microfinance model in B&H, as elsewhere, is that the additional income and employment quickly generated through microfinance-induced business activity has been an important factor in immediate poverty reduction and household reconstruction (Matul and Tsilikounas 2004; Dunn, 2005). Individuals and families that received a microloan were able to engage in some sort of business activity that generated an income sufficient to repay the microloan and leave something left over for other uses, including immediate consumption, utilities, health and education. As a result, poverty was reduced, households were able to use their earnings to invest in a variety of assets, and perhaps in some cases a few employees were taken on to create a modest local employment multiplier.

However, while these short-run gains of the microfinance model have been extensively aired by the MFIs themselves and by their international donor sponsors, the longer-run impact – be it positive, neutral or negative – has not been revealed to anywhere near the same extent, if at all. The key question for economic development specialists, as perhaps opposed to the narrow concerns of the sub-set of microfinance 'technicians' (repayment rate, financial sustainability, client retention rate and so on) is: to what extent is the emerging microfinance-induced microenterprise structure and social impact consonant with establishing a sustainable local economic and social development trajectory? The question must be urgently posed because there is mounting evidence that we may be witnessing in B&H an example of what Ellerman (2005) calls an 'anti-development' intervention – an intervention that, like bad medicine, produces some immediate relief (poverty reduction) but at a price of substantially increased longer-run pain, and eventually 'death' (to the chances of sustainable economic and social development). It is to this crucial issue in B&H that I now turn through an examination of five key sustainable economic and social development variables.

4.1. Material support for the deindustrialization and infantilization of the B&H economy

A good many economists predicted at the beginning of the transition process in Eastern Europe that neoliberal transition policy would inevitably, and quite unnecessarily, destroy a very large part of the industrial sector and technological base (Amsden 1994; Taylor 1994). As Amsden et al, (1994) stressed, the imperative in Eastern Europe was for state mediation and an industrial policy that could help the best-placed enterprises (irrespective of ownership, sector or size) to restructure and survive in the new market economy.

This line of argument also implied the need for a specifically *local* industrial policy approach to deal with the crucial microenterprise and SME sectors. A well-designed local industrial policy would need to involve the establishment of a stock of pro-active long-term focused local development and financial institutions that could support new ventures and marshal the best of the existing stock of microenterprises and SMEs towards higher levels of productivity, innovation and technology intensity, encourage vertical and horizontal interaction and information exchange, and provide direct encouragement for new microenterprises and SMEs to 'organically' emerge from the very many declining large industrial enterprises. As Brunner (1996) warned with regard to the East European post-communist situation,

> Successful East Asian economies have shown that industrial and regional policy programmes are a necessary part of a strategy that does not rely on a belief in a spontaneous rise of the entrepreneurial phoenix. From past experience it is clear that functioning markets and capable market agents have to be created and sponsored by conscious institutional design and public policies.

However, there was never any attempt to establish a local industrial policy for B&H. Nor was there any significant response to the very public demands from remaining industry/production-based company owners and managers in B&H for special investment financing institutions to urgently help them restructure, reinvest and retool in order to compete in the new marketized economy. [5] Instead, the B&H economy was endowed with the 'market-driven' microfinance-led reconstruction programme. The publicly expressed hope was that the 'entrepreneurial phoenix' would be spontaneously (re)born through a rapidly expanding and increasingly sophisticated microenterprise and SME sector.

The crux problem here, however, is that the microfinance model contains an 'adverse selection' anti-industrial bias. This bias works by filtering out those potential entrepreneurs wishing to work in the industrial sector but who cannot hope to service the onerous terms and conditions offered by the commercial microfinance institutions, and filtering in those ventures incorporating only the very simplest of non-industrial business ideas that just about can. We might call this framework created by the commercial microfinance model a 'disabling environment'. Accordingly, as noted above, most microfinance in B&H has overwhelmingly gone into establishing tiny, informal, non-industrial ventures, with almost nothing directed towards financing potentially sustainable small-scale industry-based ventures. The rub is that the resulting 'shallow' structure of microenterprises is not associated anywhere with the construction or reconstruction of a sustainable local, regional or national economy. [6]

In B&H, however, very much as in the rest of Eastern Europe, the comparatively high level of industrial development, skills and technology in 1995 represented a once only opportunity to establish a core of small-scale, innovative, relatively technology-intensive, industry-related ventures. B&H's substantial military-industrial complex was one particular area where such conditions resided, suggesting this sector as the obvious entry point.[7] As Ellerman (2005) has

---

[5] For example, a 1996 World Bank survey (World Bank, 1997) of mainly industrial/production based company owners found that their number one priority was to be able to access investment capital.

[6] For example, see Weiss, 1998 and Chang, 2002.

[7] One obvious post-conflict example that could have provided some useful lessons at this specific juncture (1996) was the recovery and re-industrialisation of the Emilia Romagna region of central-northern Italy after 1945. Creatively utilizing what was left of its military-industrial sector in order to give birth to a raft of relatively technology-intensive small firms, the very pro-active regional and local governments and other support

argued, such an industrial inheritance constitutes a hugely valuable resource of entrepreneurial, industrial and technological 'genetic material' that could and should be catalyzed by outside stimulation and assistance and recombined into rafts of new smaller enterprises.[8]

But working through the microfinance model which, as intended, was pretty much the *only* major local financial support structure in B&H geared up to new start enterprises,[9] such crucially important potentially sustainable local economic development trajectories were repeatedly ignored. Instead, as we have noted, funding was channelled into a raft of largely unsustainable trade- and household-based economic activities. The typically more sophisticated SME sector also remained extremely 'shallow' in spite of its significant industrial inheritance and post—Dayton financial bonanza, as Table 1 indicates. The EU's urgent call in 1999 for an industrial policy response to the almost total lack of new private industrial ventures was just one of the indications of the seriousness of the situation. But nothing was done. This sub-optimal development trajectory represents a huge opportunity cost in B&H directly attributable to the commercial microfinance model.

Table 1. Sectoral distribution of SMEs in BiH

Year	Trade	Manufacturing (mainly 'handicrafts'	Construction	Services	Other
2001	45%	18%	9%	12%	16%

Source: UNECE (2003: 95)

The practical significance of the 'adverse selection' losses brought about in B&H through the commercial microfinance model can be simply illustrated by the experience of the Energoinvest company network, once one of the most technically advanced, innovative and R&D-driven companies in Eastern Europe. After 1996, Energoinvest was forced to seek ways to drastically reduce its workforce. At the same time, Energoinvest provided an almost ideal practical 'breeding ground' for its highly skilled employees to start new and spin-off entrepreneurial ventures based, not on simple arbitrage, but upon reasonably sophisticated and innovative product and process ideas. However, the overwhelming majority of those who responded to the call to set up their own such innovative business quickly found that realistically they could not meet the strict conditions required – namely, high interest rates and short repayment periods – in order to access funds from the network of MFIs. The result was that virtually all of the potential new small business ideas arising from employees within EnergoInvest were aborted or else substantially 'downgraded' into something that the MFI sector would be willing to finance, such as a shop or a simple trading venture. [10]

---

institutions were able to support into operation what was to become the core of a world-beating industrial SME sector (see Capecchi, 1990).

[8] A more recent practical example referred to by Ellerman is that of the ARIA Project in Moldova, an innovative World Bank project that successfully gave birth to a raft of new small and dynamic enterprises within the collapsing hulk of an old state owned industrial enterprise (see Ellerman and Kreačić, 2002).

[9] Alternative local financial models proposed by some of B&H's best economists were either ignored or blocked by the IFIs (see Bateman, 2003). It also didn't help that B&H's new private commercial banks were and remain extremely risk averse, for example 'investing' most of the capital they raise locally in German and UK bank accounts (see Caušević, 2002).

[10] Interviews by the author with ex-*Energoinvest* employees and former *Energoinvest* managers, summer 1997 and 1999, and 2002.

In sum, the microfinance model has given rise to an 'adverse selection' bias that has materially contributed to the hugely damaging de-industrialization and infantilization trend evidenced in B&H since 1996. Given that B&H possessed a comparatively high level of industrial development, technology, innovation and technical skills prior to the war – an inheritance that most developing countries today are, and should be, desperately striving to attain – the wilful abandonment of this industrial inheritance as a source of enterprise development is an enormous setback to its hopes of establishing at any time in the future a sustainable growth and development trajectory.

4.2. The creation of an atomized 'unconnectable' local enterprise sector

It is increasingly accepted that the tissue of interconnections within the local enterprise sector is one of the crucial determinants of a local economy's ultimate sustainability, and not simply, if at all, the *numbers* of enterprises therein. With a variety of enterprises engaged in more demanding areas with regard to technology, innovation, skills, coordination and planning, managerial competences and so on, it is possible for a local economy to gradually advance and prosper in a sustainable manner. This insight is pretty conclusively underpinned by a number of research traditions, such as the new economic geography, industrial districts, social capital theory, cluster and network theory, value chain analysis, the role of technology and innovation, and so on. As Weiss (1988) sums up, reflecting on the great successes of both the Italian and Japanese microenterprise sectors since 1945, 'the core of modern micro-capitalism is not competitive individualism but collective endeavour'.

In B&H, however, generally no strong positive spill-over effects arising from 'connectedness' are possible precisely because the agglomerations of microenterprises and SMEs arising from the microfinance model to date are overwhelmingly unsuited to the task. The microfinance model in B&H has verifiably succeeded in producing significant *numbers* of new microenterprises, as Table 2. indicates. However, the overwhelming majority of these individual microenterprises are completely unsuited to forging the efficiency-enhancing horizontal ('proto-industrial districts') and vertical (sub-contracting) connections seen everywhere else as crucial in establishing and firmly embedding a sustainable growth and development trajectory in place.

Table 2. Total number of incorporated enterprises and partnerships in BiH

Year	Total	0-9 employees	10-49 employees	50-249 employees
2001	30,200	25,600	3,380	1,020

Source: UNECE (2003: 89).

4.3. Programmed failure to reach minimum efficient scale of operations

In all enterprise sectors there exists a minimum efficient scale of production, which is the level of production below which, for a variety of reasons (required technology, economies of scale and so on), it is very difficult indeed to become competitive. The structure of microfinance generally ensures that the microenterprises it supports, in virtually whatever sector, are all well below the minimum efficient scale for that sector. The end result is the entry of large numbers of microenterprises all with very little chance of becoming competitive in the sector within which they operate.

That the microfinance model is patently unsuitable for anything but the very smallest ventures within any particular sector is widely accepted, including in B&H. A major survey by Matul and Tsilikounas (2004) revealed that many people in B&H unwilling to access microloans felt this way because, 'loan terms are too short for business start-ups and loan sizes too small…loans are too small and do not allow to start a "true business"…loans are too small for business expansion'

Given that many potential entrepreneurs in B&H considered microfinance insufficient to capitalize a 'real' business to the required level for their particular sector, we must then enquire as to what was the end result for those who *did* anyway choose to utilize microfinance. Consider the first wave of microfinance-supported activities in B&H after 1996 – shops and kiosks. This sector began to run into the sand around 1999-2000. Market development and saturation effects (namely, increased competition from other new small ventures, new supermarkets) were combining to undermine their ability to compete. Already wafer-thin margins and turnover began to decline even further, in turn reducing the already minimal level of earnings and wages in the sector. The rate of exit began to rise. At this point, some MFIs in B&H could see the writing on the wall and thenceforth a number began to bar their microloans from being used for such increasingly risky activities. But as many such microenterprises began to grind to a halt right across B&H, plunging those just able to survive into a particularly dispiriting form of 'entrepreneurial poverty', the MFIs were able or willing to do very little to help them. Some MFIs were anyway focusing on which sectors to move into next in order to keep themselves in business.

The next identifiable move made by the MFI sector in B&H was into very small-scale agricultural ventures. From around 2000 onwards, microloans were increasingly being offered to those individuals wishing to undertake some very basic agricultural activity - purchase an additional cow, buy some seeds, repair a barn or store room, or buy the year's required amount of fertilizer. But in the agricultural sector too, once the local market developed, and particularly as local agricultural processors in B&H were privatized and profit considerations forced them to rationalize their local supplier base, this latest wave of very small microfinance-supported subsistence farming operations also ran into a wall. In the dairy industry, for example, the microfinance-induced proliferation of two-to-three cow farms provided a short-term income boost to the farming family. However, these short-term gains were quickly lost for very many farmers when, as predicted, their new patently inefficient farming unit was a little later winnowed out of the local dairy supply chain.

Of course, in B&H some small-scale microfinance-assisted farmers have survived, and a tiny few have even prospered (thus becoming role models for the MFIs and their international donor sponsors). But it is widely recognized in B&H that the emerging overall structure of very tiny farming units is a quite inappropriate foundation for future sustainable growth and development in the agricultural sector. Material support for its perpetuation and extension, as opposed to its conversion, therefore not only added to the huge structural problems already present in the agricultural sector but was a significant waste of scarce international and local financial resources to boot.

In sum, the widespread assisted entry of microenterprises all operating well below minimum efficient scale for their particular sector carries grave risks and serious costs into the longer term. Typically, the structural distortions created require later attention from policy-makers, and at a not insignificant cost. At the same time, attempts to survive through hyper self-exploitation ripple negatively across the entire microenterprise sector, leading to falling

margins, reduced reinvestment and 'entrepreneurial poverty'. The inevitable decline and eventual exit process for the majority of such unfortunate individuals is then painful, both in financial terms (loss of savings and physical assets, incurring of additional debts) and in personal terms (loss of confidence, loss of reputation, severed social connections). It is clear that there are many negative social side-effects arising in B&H in this regard, such as depression, increased incidence of household violence, reduction in neighbourliness, and so on (see for example, World Bank, 2002). The routine creation of unsustainable rafts of microenterprises in B&H, and then their very predictable collapse - 'houses of cards' – thus involves many long-run negative financial impacts and social costs that can, and probably do, outweigh any initial poverty reduction gains.

4.4. Facilitating trade deficits and import dependency

One of the most damaging features of the neoliberal programmes that developing countries were forced to endure during the 1970s and 1980s was the collapse in local manufacturing and agricultural production brought about by instant trade liberalization and an ensuing flood of (often subsidized) imports. Thanks to the basic operations of small importing and shuttle trading ventures, import dependence was quickly embedded into the system. Crucially, the debilitating longer-run impact of import dependency meant that it ultimately destroyed any short-term poverty reduction gains made during the initial phase of trading sector microenterprise expansion. SAPRIN's (2001) conclusion was that the initial uncontrolled surge of imports needlessly contributes to:

> The failure of many local manufacturing firms, particularly innovative small and medium sized ones that generate a great deal of employment. The decline in domestic manufacturing has followed the flooding of local markets with cheap imports that have displaced local production and goods and has been exacerbated by the absence of an industrial policy to support domestic firms in dealing with new conditions or with shocks in international markets.

Given that simple trading ventures are cheap and easy to enter and require little in the way of special skills, they are very understandably the first destination of many individuals seeking a route out of poverty. And if MFIs are willing to underwrite such business propositions, because the initial profitability is more than enough to deal with their high interest rates and short repayment periods, then a major boost to their numbers is an obvious outcome.

As could have been predicted, therefore, the newly established MFIs in B&H began their life by whole-heartedly engaging with the small-scale trading sector. Simple cross-border shuttle trading quickly became one of the most visible forms of individual business activity right across post-Dayton B&H, requiring only a little cash up front from a microloan to buy or repair a vehicle and to buy some stock while abroad. Not surprisingly, however, the B&H trade balance began to suffer, inevitably diverting scarce foreign exchange from other more urgent areas, and thus damaging the overall prospects for economic growth and development. Of course, calculating quite how much of the negative trade balance has been *specifically* precipitated by the working out of the microfinance model requires deeper study. But even local analysts otherwise sympathetic to the microfinance model agree that the instant splurge of imports was deeply damaging to the B&H economy, and that it was partly attributable to the microfinance model because, 'Microcredit often permanently institutionalises the smuggling of goods and the widespread (though legal) importation of simple, low value added goods that would and could be better produced locally' (Čičić and Šunje, 2002).

4.5. Destruction of local social capital

Social capital is now seen as a major factor in promoting successful local economic and social development, if indeed it is not the 'missing link' in development (Putnam, 1993). However, there is growing evidence in B&H to suggest that the microfinance model very actively *destroys* social capital. First, and more generally, by recasting individual survival as a function of individual entrepreneurial success, the bonds of solidarity, shared experience and trust that exist within poor communities are inevitably going to be undermined. This is a truism. But more specifically, whenever community development and support activities are recast as commercial and strict cost-recovery operations – a central operating principle of the commercial microfinance model – the unavoidable consequence is a degeneration of the level of local solidarity, interpersonal communication, volunteerism, trust-based interaction and goodwill. In post-conflict B&H it is clear that the overarching emphasis upon individual survival strategies (as well as the accompanying inequality) has undermined the previous bonds of community and trust-based interaction that were pervasive throughout the country prior to 1991 and during the conflict itself (World Bank, 2002).

Consider also the effect of the evolving commercialization of most MFIs in B&H. The network of MFIs established by the international community after 1996 was initially warmly welcomed by most ordinary people. MFIs were said to be 'there to help' and to be 'showing their sympathy with the local population' by helping some of the very poorest to escape from their isolation and grinding poverty. However, once it became apparent that many MFIs were beginning to move out of the original market serving very poor and poor people, and into new markets serving the much less poor and the emerging middle class and new business elites, and also moving out of providing microloans for business purposes and into microloans for consumption goods (for example, cars and housing), attitudes began to change. They were just 'businesses' all along. The increasingly obvious concern they were demonstrating for their own survival, rather more than the survival of the local community into which they had been born, thus began to chip away at the MFIs' initially warm relationships with communities, key individuals and local politicians. The predictable outcome over time is that the commercialization inherent to the microfinance model in B&H will increasingly undermine any popular legitimacy and voluntary support from the local community. This development is in sharp contrast to the pre-communist and even communist-era community-based MFIs in B&H and in the wider Yugoslavia (for example, financial cooperatives) that generally evinced significant popular support and community involvement – that is, they actually *constructed* social capital. [11]

Second, the type of microenterprises associated with the microfinance model are, as we have seen above, overwhelmingly informal and largely displaying a limited ability to creatively interact with other businesses. Yet growing informality in B&H is clearly underpinning the already considerable lack of respect for legal process. It has also embedded a mistrust of government, and has encouraged the search for informal and sometimes illegal sources of protection (for example, criminal gangs) and power (for example, corrupt politicians) in order to continue to do business. The lack of regular inter-enterprise connections has been associated with secrecy, an unwillingness to trust, little sharing and few social connections that might substitute for legal process. Moreover, most microenterprises in B&H are also very weak and very typically involve insecurity and hyper self-exploitation (long hours, intense work, poor rewards, undignified working conditions, little security of income and so on).

---

[11] For the situation pre-WWII, see Tomaševic, 1955; and for the situation under Yugoslav worker self-management, see Horvat, 1976.

Such adverse conditions have inevitably generated alienation and antagonism towards the wider B&H society that is seemingly indifferent to the plight of those involved, with special enmity reserved for the tiny new business elite enjoying a stratospheric level of power and financial reward that is widely seen (with much justification) as having been illegally or unjustifiably accumulated.

All of these pretty regularly observed outcomes of the commercial microfinance model in B&H are unequivocally associated with the destruction of social capital (Bateman, 2006). The already fragile social foundations of B&H are, thus, further undermined and destroyed. Moreover, such an adverse social outcome in turn has served to further deter local savings, local investment, business cooperation and other key economic growth variables. All told, these very significant drawbacks to the commercial microfinance model in B&H were crucial barriers to sustainable development. Moreover, such emerging problems were certainly not lost on B&H economists, including Čičić and Šunje (2002), who warned that, 'Very much as in Southern Italy, if the legitimacy of semi-legal, arbitrage-based occupational lifestyles is embedded within the local society and polity of B&H, it will eat away at the social capital upon which longer run business success will depend'.

5. CONCLUSION

While the commercial microfinance model established in B&H after 1996 is possibly associated with some short-run poverty reduction impacts, analysis of emerging trends and developments suggests that this immediate gain has been achieved at a very high price indeed. Very little evidence has emerged in B&H to suggest that the commercial microfinance model actually possesses the required 'transformative capacity' to secure genuinely *sustainable* poverty reduction, through genuinely *sustainable* local economic and social development. On the contrary, the commercial microfinance model is quite centrally implicated in the evolution of the disturbingly weak, unsophisticated, anti-social, disconnected and unfair economic and social structures we see in B&H today. Like a rapidly growing weed that hogs the nutrients and sunlight needed by the slower growing crops around it, the commercial microfinance model in B&H has absorbed significant international financial resources, high-level technical expertise, political commitment, valuable time and remaining accumulations of social capital, all in order to roll out a primitive, no-growth 'bazaar economy' redolent of life in B&H 100 years ago.

A regular consequence of unsuccessful business management is bankruptcy. It is not suddenly and unreasonably that a business ends up bankrupt; thereby it is possible to prognosticate, foresee and prevent such an outcome. The possibility of bankruptcy can be determined – with a high degree of probability – by existing methods of forecasting,

Financial managers may face a task to identify the most appropriate method for prognostication of eventual bankruptcy in particular circumstances. This article to some extent enables to become more competent in system of indicators and models that are used to prognosticate eventual bankruptcy and in their effective application (with a high probability of preciseness).

There are three ways in the contemporary practice of prognostication of the financial standing with regard to an eventual bankruptcy:

- applying a system of criteria and indicators for diagnostics of possible bankruptcy;
- calculation of the universal solvency index;
- prognosticative calculation of indicators characterizing structural condition of balance.

Today it is possible and also necessary to apply a system of criteria for diagnostics of possible bankruptcy, though it is not completely faultless. As the criteria have various degrees of importance, it is always problematic to determine how and which criteria are enough to speak of an eventual bankruptcy. In order to avoid subjectivity in evaluation of a business it is a matter of necessity mainly to base upon experience of auditing and apply the following system of criteria as a preliminary signal system for more detailed case analysis.

Two–stage system of criteria and signs for prognosticating the probability of bankruptcy according to recommendations from the Committee for Audit Practice (Great Britain)

| The following indicates and criteria suggest possible financial problems and possibility of bankruptcy in the near future. | Serious, recurring losses in basic activity (steady fall in volume of production; declining volume of sales; continuously negative profitability) Regular overdue payments to creditors and regular overdue payments of debts by debtors Excessive use of short–term credit resources for long–term financing needs Low liquidity indicators, with a tendency to decrease Increase in proportion of borrowed capital to a dangerous limit within the common capital structure Shortage of own working capital Continuous increase of capital turnover period Excessive stocks of raw materials and finished products Wrong reinvestment and dividends policy Regular default of repayment of loans and payments of interests and dividends to investors, creditors and shareholders Worsening relations with credit institutions Applying new sources of financing on disadvantageous terms Exploitation of physically and morally outdated equipment in production process Unfavorable changes in the portfolio of orders Fall in market value of a company's shares Declining production potential |
| Unfavorable influence of the following indicators is not necessarily a foundation to consider the existing financial position to be critical, but it may as well deteriorate if appropriate steps are not taken in the future | Low degree of diversification of a business activity (excessive dependence of a business upon a certain project, sort of equipment, sort of assets, raw materials or sales market) Loss of the most important contractors Underestimation of the necessity to renew equipment and technology Forced idle time and breaches in the rhythmical pace of the technological production process Overestimated efficiency of new projects Implication in trials without predictable outcome for a business Loss of competent managerial staff Ineffective long–term agreements Shortage of investments High–level political risk for whole company or its branches or structural units |

Appearance of one or another criterion or a group of criteria does not provide a base for the management to make the ultimate decision. Economic analysts always have tried to foresee bankruptcy on the ground of the numerical coefficients or a generalized indicator. In the sixties of the 20th century, William Beaver made a first attempt to systemize coefficients reflecting probability for bankruptcies of enterprises. He identified the coefficients dynamics of which showed signs of bankruptcy. By analyzing the tendency of changes in financial indicators and applying the scale of critical values, the enterprise in question could be related to a certain group of risk.

Further development of adaptation of the financial indicators to prognostication of bankruptcy ended in what became a working–out of unified, generalized indicator. The most common is a pattern developed by E. I. Altman in 1968. Solvency index Z can be calculated by Multiple Discriminant Analysis (MDA) in the following way:

The pattern of five factors by Altman
$Z = 1, 2\, K_1 + 1, 4\, K_2 + 3, 3\, K_3 + 0, 6\, K_4 + 1, 0\, K_5$
where:
K_1 – own current assets / total assets;
K_2 – retained earnings / total assets;
K_3 – earnings before interests and taxes (EBIT) / total assets;
K_4 – share capital at market value / liabilities;
K_5 – net turnover / total assets.

Critical value – 2, 675.
The prognostication indicating probability of bankruptcy depends upon quantity of Z:
- under 1, 8 – extremely high;
- from 1, 8 to 2, 7 – high;
- from 2, 8 to 2, 9 – possible;
- more than 3, 0 – very low.

In order to work out the pattern Altman studied a large number of companies in US, taking into account 22 financial coefficients relating to the evaluation of eventual bankruptcy. In the course of the research five coefficients of the greatest importance in forecasting the possibility of bankruptcy were made separate. They were given a weight, with parameters evaluated on the ground of statistical data processing for chosen companies. It is possible to forecast bankruptcy with the precision of 95% using this pattern according to statistics. Besides bankruptcy can be prognosticated with precision of 95% a year before it occurs and 72% two years before it occurs that approves the effectiveness of using E.I. Altman pattern.

The pattern, however, does not take into consideration specifics of other countries, specifics of different industries, and the fact that its main target is the range of major public stock corporations quoting shares in stock market makes it difficult to apply the pattern in other circumstances. Thus a version of the pattern was developed containing indices based only upon data of financial statements.

Version of the pattern of Altman
$Z = 0, 72\, K_1 + 0, 85\, K_2 + 3, 1\, K_3 + 0, 42\, K_4 + 1, 0\, K_5$
Where:
K_1 = net working capital / total assets;
K_2 = net profit / total assets;

K$_3$ = EBIT / total assets;
K$_4$ = equity / liabilities (borrowed capital);
K$_5$ = net turnover / total assets.
Z < 1, 20 – high probability of insolvency;
1, 20 < Z < 2, 90 – uncertain position;
2, 90 < Z – insolvency is not prospective.

As concerns small businesses, a pattern of two factors is set up to evaluate the possibility of bankruptcy. Yet, the fewer factors are considered, the more inaccurate is a forecasting. This model has advantage of simplicity, as well as option of application, when amount of information about an enterprise is confined. But the error of prognostication, applying the two-factor pattern of Altman, is determined within the interval $\Delta Z = \pm 0, 65$.

The pattern of two factors by Altman

Z = -0, 3877 K$_1$– 1, 0736 + 0, 0579 K$_2$
Where:
K$_1$ = total liquidity;
K$_2$ = proportion of borrowed capital within total capital.

Businesses with Z = 0 have the probability of bankruptcy comparable to 50 %. When Z < 0, the probability of bankruptcy is less than 50 % and it decreases further depending on decrease of Z. When Z > 0, the probability of bankruptcy is more than 50 % and it increases depending on increase of Z.

Altman pattern could be recommended to be used in other countries, although results in accordance with financial parameters of American companies between 1946 and 1965 on the basis of data of financial statements hardly can be recommended to be used in other transit economy country.

To develop a pattern reflecting the real situation of the sector, it is essential to gather necessary financial data from financial statements of large number of companies. Thereby a new Z-pattern based on different financial coefficient and other pattern parameters was developed. Thus were founded the four-factor patterns of Taffler and Tisshaw, Lis and Springate.
Results from Taffler and Tisshaw pattern for British companies published in 1982. Initially 50 financial coefficients were chosen of which five key-parameters were eliminated using the MDA. Those parameters are: return on total assets calculated from retained earnings, financial leverage coefficient calculated as ratio between borrowed capital and long-term investments, working capital and equity capital coefficients, and resource turnover period.

E.I. Altman and R.Taffler pattern structure approves the difference in used financial coefficients even though structure of coefficient groups is similar. In comparison with Altman pattern, Taffler patter has several advantages because it is fully based on financial statement data when Altman pattern uses market value rate.

Following Pattern by Taffler and Tisshaw can be used for manufacturing companies that quote shares in Stock Exchange:

Pattern by Taffler and Tisshaw:

$Z = 0, 53 K_1 + 0, 13 K_2 + 0, 18 K_3 + 0, 15 K_4$
Where:
K_1 = gross profit / short–term liabilities;
K_2 = current assets / total liabilities;
K_3 = short–term liabilities / total assets;
K_4 = earnings / total assets.
$Z > 0, 3$ – normal prospects
$Z < 0, 2$ – possibility of bankruptcy.

Similar to Taffler and Tisshaw pattern was made by Lis and Springate.

Pattern by Lis:
$Z = 0, 063 K_1 + 0, 092 K_2 + 0057 K_3 + 0, 001 K_4$
Where:
K_1 = current assets / total assets;
K_2 = gross profit / total assets;
K_3 = retained earnings / total assets;
K_4 = equity / liabilities
$Z = 0, 037$ – critical value

In 1978, at the Simon Fraser University, L. V. Gordon Springate established the four–factor **Z–pattern of Springate**:

$Z = 1, 03 X_1 + 3, 07 X_2 + 0, 66 X_3 + 0, 4 X_4$
Where:
X_1 = share of current assets in total assets;
X_2 = proportion of EBIT to balance value;
X_3 = proportion of earnings before taxes to short–term debts;
X_4 = return of all assets (ROA).

When $Z < 0, 862$, a business is considered to be bankrupt. In the course of developing the pattern Springate analyzed 40 enterprises and reached 92, 5 % credibility, when he forecasted solvency for term of one year.
Proportion of EBIT to balance value is calculated by the following formula:

$X_2 = (EBT + PLI) / BV$
Where:
EBT = earnings before taxes;
PLI = payment of loan interests;
BV = balance value.

At the Riga Technical University in 1998 Z–pattern was developed for prognostications indicating the possibility of bankruptcy to be made accordingly to the circumstances of Latvia. Information on 23 Latvian companies was used. All 23 companies can be classified as different including successful companies and companies that announced insolvency in the period between 1994 and 1996. Companies cover various economic sector: wood-processing, electrical equipment, radio electronic, metal working, wood-pulp and paper industry, sewing, wholesale and retail.

As selection in based on companies from different economical sectors and financial situation we can assume that proportion of financial coefficients as a result from this analysis generally can be extrapolated to all Latvian companies.

Evaluating the precision of the results two major mistakes was observed. The first mistake M_1 occurs due to solvency prognosis when company is practically bankrupt. The second mistake M_2 arises when the pattern forecasts bankruptcy, but the company manages to maintain solvency.

In conclusion prognostication of probability of bankruptcy according to Latvian unadjusted pattern is 96%.

Analogy to original E.Alman pattern, probability of bankruptcy two years before it occurs can be prognosticated with precision of 70%. The precision of long term prognostication is impossible to calculate due to lack of statistical data (e.g. financial data from several years before bankruptcy).

Table 1 Precision of prognostication of Latvian unadjusted pattern.

Mistakes	**Precision**		**Mistake**	**Total**
	n_1	*%*	*%*	*n*
First mistake M_1	11	100	0	11
Second mistake M_2	11	92	8	12
Total	22	96	4	23
n_1 – number of companies that do not correspond to mistakes M_1 or M_2; *n – number of companies that correspond and do not correspond to mistakes M_1 or M_2.*				

Latvian pattern:
$Z = -2, 4 + 2, 5 K_1 + 3, 5 K_2 + 4, 4 K_3 + 0, 45 K_4 + 0, 7 K_5$
Where:
K_1 = net current assets / total assets;
K_2 = retained earnings / total assets;
K_3 = earnings before taxes / total assets;
K_4 = equity / total debts;
K_5 = net turnover / total assets.
$Z < 1, 80$ – extremely high possibility of bankruptcy;
$1, 81 < Z < 2, 7$ – bankruptcy is possible;
$Z > 3, 00$ – possibility of bankruptcy is not prospective or it is very low.

Slightly different approach in evaluating the eventual bankruptcy is offered by a Ginsburg. In this case the financial position of a business is estimated by a scale of points, calculated by results of indices from three coefficients.

The three–factor model of Ginsburg is used by banks to estimate the general financial condition of a business. Quantities of the coefficients applying for evaluation are divided in three classes (Table 1).

Table 2 Coefficients to work out the three–factor pattern of Ginsburg

Coefficients	1 class	2 class	3 class
Coefficient of absolute liquidity	> 1	1–0, 6	< 0, 6
Total coefficient of repayment of short-term liabilities	> 2	2–1, 5	< 1, 5
Coefficient of equity concentration	> 40 %	40–30 %	< 30 %

Each coefficient is given a rating of points:

- coefficient of absolute liquidity – 40;
- total coefficient of repayment of short-term liabilities – 35;
- coefficient of equity concentration – 25.
-

Sums of points are calculated by multiplying the number of respective class, to which refers calculated value of coefficient, with the rating given to the coefficient.

The ultimate evaluation of the financial condition is determined by referring sums expressed in points to the following groups (Table 2).

Table 3: Evaluation of the financial position, using the three–factor pattern of Ginsburg for estimation expressed in points

Number of group	Points	Evaluation of the financial position
1	100–150	Stable financial position
2	151–220	Unsubstantial deviations from norm
3	221–275	Heightened risk of bankruptcy, tension, but improvement is likely to be achieved
4	> 275	Poor financial position, high risk of bankruptcy

The coefficient of equity concentration itself is calculated by this formula:
Kpkk = equity / total assets x 100 %.

In the circumstances of transition economy the five–factor pattern of R. S. Saifulin and G. G. Kadikov has gained high appreciation because of its highly precise forecasting of the probable bankruptcy. Deficiency of the pattern is that it does not regard distinctions of industries where businesses operate.

The five–factor pattern of R. S. Saifulin and G. G. Kadikov has the following advantages:

- simplicity of the financial calculation;
- it is instrumental in classifying companies by degree of risk;
- it is appropriate for application in the circumstances of Latvia, thanks to the identical levels of normative indices that are used in the pattern;
- changes in ratings of evaluation make it possible to draw a conclusion about the efficiency of business activity or its inefficiency, as well as estimate the financial

standing; rise of rating indicates improvement in the financial standing of organization, but fall, on the other hand, suggests decline.

Method of evaluating the risk of bankruptcy is based upon the calculation of rating value by the five–model set up on the ground of the coefficients characterizing the financial stability, solvency of organization, efficiency of application of assets, profitability of basic activity and profitability of own investments.

Rating value R is calculated by such formula:

$$R = 2 \text{ Kpln} + 0, 1 \text{ Kisdz} + 0, 08 \text{ Kap} + 0, 45 \text{ Pr} + \text{Ppp}$$

Where:

Kpln – coefficient of own financial means; (?)
Kisdz – general coefficient for repayment of short–term liabilities
Kap – coefficient for turnover of assets
Pr – sales profitability
Pps – profitability of equity.

The financial standing of organization is considered to be satisfactory, when its universal rating value is 1 or higher – bankruptcy is not prospective. The financial standing of organization is considered to be unsatisfactory, when its rating value is less then 1 – risk of bankruptcy is real.

Financial managers and auditors have to decide, which tool is better to prognosticate the probability of bankruptcy. Previously discussed patterns are practiced most frequently, but there, of course, are much more. In the course of applying Z-patterns for evaluation of business, perhaps, it will turn out that while one pattern overestimates the risk of bankruptcy the other underestimates it. In that case there are alternative ways of using Z–pattern, such as:

1) working out a multi–factor pattern of your own by applying the MDA method;
2) putting into practice the existing available patterns and making generalized evaluation in the light of previous results.

The first way includes statistical processing of data bases in major Latvian companies. As concerns the second one, it must be said that it is obligatory to determine critical value Z in all Z–patterns. Deviations to one side or another will indicate the possibility of bankrupt or its absence, besides, the larger is the distance, the higher is the level of credibility. Thus it is possible – within any pattern – to create the scale indicating the possibility of bankruptcy, and in the classical pattern of Altman, for example, it looks like this:

area of high probability   **marginal**   **Area of low probability**
of bankruptcy   **value Z**   **of bankruptcy**

1,8   **2,675**   **2,9**
To every pattern of Z its own scale with particular parts a of this scale. The hardest is respective comparison of different scales in different models. Using statistical indicators and performing this task, it is possible to create universal instrument for prognostication of eventual bankruptcy. The drawback of it is number and complexity of calculations, using available Z models.

Building any kind of pattern it is necessary to calculate financial coefficients accurately and take into account several circumstances when interpreting:

1) value of some coefficients is set according to company's policy (e.g. capital assets, stock inventory methods);
2) financial coefficients describes the situation in a previous periods therefore it is difficult to forecast;
3) practically all rates are calculated on the bases of financial statements, not company's asset market value;
4) several rates provide concept only for current moment (e.g. liquidity rates) that leads to difficulties when evaluating existing situation.

The whole spectrum of developed models to evaluate possibility of bankruptcy leads to conclusion that in case of Latvia it is not appropriate to use just one single method or model. For more precise prognostication of eventual bankruptcy it is necessary to exploit the whole set of methods and on the base of their results to work out recommendations for management decision making. For smoothing of different results from different models, it is possible to use methods of average values, weighted averages or average quadratic deviation. In every case, the result of such approach is going to be more precise, if compared to any individual method or model.

Key words: *Law enforcement, Financial development,*
Transition economies

1. INTRODUCTION

The bulk of the theory and evidence points to the direction that financial development facilitates economic growth. If so, the important question is what shapes the functioning of the financial system and the level of financial development? This paper aims at responding to this question in the context of transition economies (TEs). It reviews the literature, both theoretical and empirical, in the light of the importance of the legal framework in credit markets and provides empirical evidence that 'law enforcement' matters for financial development in TEs.

Because of information asymmetries (IA) and transaction costs (TC), credit market imperfections lead to credit rationing (Stiglitz and Weiss, 1981). To correct for this, collateral plays an important role. However, institutions such as law and judiciary that support the creditors' right to repossess the collateral and ensure compliance with contractual agreements, will determine the efficiency of using collateral and other restrictive covenants (LaPorta *et al*, 1997). Hence, by designing and enforcing the creditor rights, legal institutions influence the degree and terms on which parties engage in financial transactions. Better protection of creditor rights will improve incentives of creditors to lend more, on better terms, and may correct the common problems in the credit market such as moral hazard and adverse selection.

Among TEs, those in SEE and CIS, have lagged behind the advanced reformers of CEE in building institutions supportive for the market economy. In terms of the credit market, although reforms were undertaken to strengthen the creditor rights, the enforcement of these rules remains a challenge. Efforts of policymakers should be addressed in this direction ensuring that – to the extent that law on books are the appropriate ones – they work in practice.

The paper attempts to test the importance of creditors' rights in two ways. Firstly, we provide evidence from a cross-section of 25 TEs that the enforcement of creditor rights, rather than the law itself, has an impact on financial development. Unlike other studies, we employ a broad set of measures such as depth of the credit market, credit growth, terms of lending, firm financing constraints, etc., that proxy for financial development. We find that better law enforcement is positively related with almost all the measures of financial development.

Secondly, we investigate the importance of the legal framework for financial development in Kosovo. In relation to the functioning of the financial system and the protection of creditors' rights, the basic framework regarding the law on books is already in place. However, there is no conclusive evidence on the assessment of how these laws work in practice. Employing and extending the EBRD (2003) methodology on enforcement of collaterals law we show that Kosovo compares well with other TEs and countries in the region regarding the enforcement of creditor rights.

2. LAW AND FINANCE: THEORY AND EVIDENCE

2.1. Background theories

The idea that the financial development spurs economic growth has a long heritage and the bulk of theoretical and empirical work points to the direction that finance matters for economic growth.[2] However, as Zingales (2003) points out, it is of little use to know that the relation between finance and growth exists if policymakers do not know how to promote financial development. A well-established strand of literature supports the view that institutions matter, and specifically the protection of creditor rights is one of the key aspects of credit market development. The law and finance literature argues that no credit will be extended unless the creditors' rights to repossess the collateral are not ensured. Since imperfections stemming from IA and TC are present in the credit market, in a limited liability framework, Jaffee and Russell (1976) and Stiglitz and Weiss (1981) argue that these may lead to adverse selection and moral hazard problems and result in credit rationing. Appropriate functioning of institutions may correct these market failures and facilitate financial development.

When full liability assumption enters the picture, e.g., loans are fully collateralized to correct for borrower opportunistic behavior, the collateral is used as remedy of the moral hazard and adverse selection problem. Of course, under the assumption that if borrower defaults the collateral will be easily possessed by the lender. Bester (1985), Chan and Kanatas (1985), Besanko and Thakor (1987) and Chan and Thakor (1987) have developed adverse selection models with separating equilibria and no credit rationing where the collateral serves as a sorting device. This is because less risky borrowers, in order to distinguish themselves from high-risk type, will signal

---

[2] See King and Levine (1993) and Levine (1997, 2003) for review of the literature on finance-growth nexus.

truthfully by choosing contracts with higher collateral requirements (since their probability of default is low) and low interest rates (since by assumption returns to the low-risk project are lower). In addition, the collateral may also serve as an incentive device in credit market, i.e., by making default costly, borrowers may increase their effort level in the project (Ghosh *et al.*, 2001).

One problem with these models is that they assume that borrowers are fully liable and in case of default, the transfer of collateral will be costless. However, if we move to an environment where contract enforcement is poor, the full liability assumption, that is, debts are fully collateralized and costless transfer of collateral state, would not hold. In environments with weak legal framework and poor functioning of courts, making borrowers fully liable for their loans by means of the collateral is not an easy task. If lenders are aware that laws are not protective and the chance of taking over collateral is at stake, they are likely to limit credit extension.

2.2. The role of institutions

Most of neo-classical economics abstracts from considering market frictions such as TC and IA. In addition, it is assumed that the institutions, i.e., laws and courts, are in place to enforce contracts and protect the rights of parties in the transaction (Williamson, 2000). In contrast, the New Institutional Economics (NIE) has shown deviations from the neoclassical ideal. Information is incomplete, asymmetrically distributed and costly to acquire. The NIE analysis at a micro level takes transactions as the basic unit of study and focuses on transaction costs using contractual reasoning (Murrell, 2005).The cost of transacting is positive which consists of the cost of acquiring information needed to measure attributes of parties in the transaction, the cost of protecting rights and the cost enforcing contracts (North, 1990).

The financial development literature has used the tools of the NIE to show the relevance of institutions in the functioning of the financial system. The characteristics of the legal and regulatory system influence the degree to which creditors can acquire information about borrowers, make contract agreements, and enforce those contracts. One of the remedies to imperfect markets is well functioning institutions, be it proactive regulatory institutions or reactive ones such as the courts.

Information acquisition costs are the major part of TC. In the lender-borrower relationship when the characteristics of the borrower are not known, IA are present and the costliness of acquiring information depends on the existence and the quality of institutions e.g., systems of notice such as credit and pledge registers, accounting standards, etc. All these, with the aim of reducing IA, ascertain the quality of the borrower and rely on contracts which will not be violated. Information acquisition should be validated with appropriate documentation on information. For example, auditing financial statements that firms disclose, the proof of ownership rights of assets to be pledged, etc. Although this process is costly itself, the relative differences in how institutions function will determine the TC of engaging in the contract. The alternative, i.e., missing institutions or improper functioning of institutions, will leave the lender in information disadvantage and in a severe IA framework the credit market may collapse.

After the contract the lender engages in costly monitoring in assessing whether the terms are being respected. When the deviant behaviour is observed in the monitoring

process, it should be verified in the court of law. Courts cannot verify whether the violation has occurred in absence of institutional settings e.g., accounting standards. Or courts may lack efficient procedures to handle the case or they may be corrupt, all adding to the TC. If enforcement takes place it involves TC e.g., legal representation, information acquisition costs, etc. The relative differences in how well the process is conducted would determine the costs and incentives in engaging in the credit relationship. Complex and time consuming procedures, unpredictable judgements, and corruption would reduce the willingness of a lender to enter into the credit relationship in the first place. As a result, legal institutions will fundamentally influence the ability and willingness of creditors to perform their functions; that is, to identify the most productive firms, screen and monitor, mobilize savings, facilitating financial sector development and presumably economic growth.

Only recently models of the lender-borrower relationship have been developed to introduce an additional agent, the institutions. In a model with incomplete contracts and multiple creditors, where firms can promise up to the full amount of available assets to multiple creditors, Berglof, *et al.* (2000) argue that this would increase a firm's debt capacity while increasing its incentives to default strategically. In a similar way, in a model of corporate finance with collateralized debt contract and a moral hazard argument of credit rationing, Fabbri (2001) argues that the government may improve access to finance by investing in the legal system.

In a model of opportunistic debtors and imperfect courts, Jappelli, *et al.* (2005) argue that the degree of law enforcement will affect the borrower's future willingness to pay (degree of moral hazard) which in turn would determine the *ex ante* willingness of creditors to lend and terms of lending. Efficient law enforcement makes it costly for borrowers to default, hence incentives to perform are enhanced, corrects *ex ante* lenders' incentives to lend since recovery in the case of default is full, and as a result degree of credit rationing would depend on collateral availability. The higher the expected fraction of recovery – that is the more efficient are courts – the lower collateral-to-loan ratio will be required from the borrowers. This will increase the pool of potential borrowers, which previously could not qualify even if they had projects with positive net present value. By assuming efficient and competitive financial markets, terms of loans will improve and credit rationing will decrease.

In a recently flourishing law and finance literature, the roots of the role of creditor rights in financial development should be traced back to the seminal work of LaPorta, Lopez-de-Silanes, Shleifer and Vishny. In LaPorta, *et al.* (1997, 1998), it is the protection of shareholder and creditors' rights that determines the degree of development of capital markets across countries. They relate this to the legal heritage of different countries which differ in the degree of protection of creditor and shareholder rights.[3] LaPorta *et al.* found strong evidence for the impact of the legal

---

[3] Countries that adopted Anglo-Saxon law tradition (common law countries), on average, outperform other legal families (civil law countries) in terms of the protection of creditor and shareholder rights and have more developed financial markets. Various theories have evolved in law and finance literature. For example, Beck, *et al.* (2003a) emphasize the role of flexibility in the lawmaking in influencing financial development. Beck, *et al.* (2003b) argue that in addition to the legal origin, type of colonisation ('settler' or 'extractive') shaped the quality of institutions for the protection of property rights and financial development. Some studies go on to show that the religion explains the cross-country differences in financial development (see for example Stulz and Williamson, 2003).

environment on the size of capital markets across countries. Using a sample of 49 countries around the world, they found that countries with poorer protection of investor rights, measured by the character of legal rules and the quality of law enforcement, have smaller and narrower capital markets (equity and debt).

In the transition context, Slavova (1999) and Pistor, *et al.* (2000) provide evidence that legal aspects matter for financial development. Slavova (1999) used a cross-country study of 21 TEs in 1998 and found that only legal enforcement matters for banks' credit to the private sector, and that the law on books itself does not appear to affect the banking sector intermediation to the real economy. As she points out, banking law enforcement is found insignificant in a specification controlling for growth and inflation, whereas aggregate financial law enforcement is significant only at the ten percent level. Similarly, Pistor, *et al.* (2000) find stronger evidence for the impact of law enforcement measures on the development of capital markets in TEs than law on books. However, their results too are weakened when macroeconomic stability measures are introduced in the model.

Recently Djankov, *et al.* (2005) extend LaPorta *et al.*'s cross-section analysis in 129 countries around the world. Apart from the legal issues regarding the creditor rights – 'power of creditor theories' – they assess 'information theories' when lenders know more about their borrowers, their credit history, etc. They found that higher creditor rights protection through the legal system and the presence of information sharing institutions are related to deeper debt markets.

2.3. Critical assessment of law enforcement measures

Different studies employ different measures when it comes to enforcement of creditor rights. LaPorta, *et al.*, (1997) measured the degree of law enforcement in different countries using several ratings. First, efficiency of the judicial system (produced by Business International Corporation) was a survey-based scoring where foreign firms were asked to evaluate the efficiency and integrity of the legal environment as how it affects firms. Second, the authors used 'rule of law' index which is an assessment of the law and order tradition in the country produced by International Country Risk Guide (ICRG). All these measures are a mixture of indicators such as corruption, risk of expropriation and contract repudiation by the government, etc. Although these measures may be good proxies for law enforcement in the particular country, they reflect more general institutional setting. Being multidimensional, none of these deals explicitly with law enforcement in the lender-borrower relationship. For instance, how much and how fast the creditor may expect that he can recover his debt from the defaulting borrower.[4]

Slavova (1999) and Pistor, *et al.* (2000) use the EBRD measure of extensiveness and effectiveness of financial institutions laws. These capture both banking and stock market reform, i.e., compliance with Basel accords on capital adequacy and stock market development in line with international standards, then dimensions such as the power and authority of supervisors, money laundering issues, etc. Since financial institutions effectiveness and extensiveness capture regulator-bank relationship, stock market regulations and being too general, it may be said that this may not capture

---

[4] As we will see later in this paper, the EBRD does this for TEs.

directly laws governing lender-borrower relationship. As such, it may not have any direct impact on a bank's lending.[5]

Most recently, Djankov, *et al*. (2005) measure enforcement of creditor rights by number of days it takes to enforce a simple debt contract. This is a World Bank Doing Business methodology through case study survey. Law firms were asked for a complete write-up of the legal procedures necessary to dispute these cases in court. Based on this, the measure is constructed by specifying the time it takes courts to handle two types of cases: the eviction of a residential tenant for non-payment of rent and the collection of a check returned for non-payment. While the former does not pick the commercial loans, the latter captures firm-trade creditor relationship worth 200% of country *per capita* GDP. Then the amount of debt may not be appropriate – in the case of Kosovo this would be 2000€, a typical consumer loan which may not be appropriate transaction for capturing enforcement of creditor rights. Involving courts for resolving small transaction disputes may be more costly than the value of transaction itself. Interestingly, as indicated in their scores, it takes around 1000 days to enforce such contracts for example in Slovenia and Poland - advanced reform TEs.[6] Whereas in Albania, BiH, Romania (less advanced reform TEs) it takes around 300 days and Bulgaria and Croatia 400 days. The average for CIS in their score was 331 days whereas for CEE 442 days. This gives a completely different picture from EBRD (2003) scores on the enforcement of secured transactions discussed later in this paper.

3. LAW IN BOOKS AND LAW ENFORCEMENT IN TRANSITION

When the transition process started, some countries followed the 'big-bang' model of transition, some opted for gradualist transition and those in the middle adopted a mixed model. Countries ended up with different degrees of economic recovery, growth, and institutional performance. Advocates of the 'big-bang' approach emphasized that with price liberalization, privatization, and the removal of capital controls, market forces will ensure efficiency and that the legal and institutional basis for a market economy could be established quickly (Sachs, 1991). However, in the first decade of transition, most TEs did not recover from the transition recession and did not achieve the pre-transition GDP level and growth. Price liberalization, liberalization of capital accounts, privatization, etc., were easier to adapt. Indeed, broadly all TEs have undertaken these steps. But when it comes to institutions, we have learned that it takes time to build them.

There were many reasons behind the underdevelopment of institutions, and particularly the legal reform. In some cases there was no political will while in others policymakers had other priorities. If dominant political groups want economic prosperity and are willing to risk the loss of political control over the economy that

---

[5] Jappelli, *et al*. (2005) measure law enforcement in a credit market with the length of ordinary civil trials and number of civil suits pending per thousand inhabitants. In this study too, the measure may not capture accurately lender-borrower dispute resolution since civil suits may involve various enforcement actions unrelated with the credit market.

[6] Weder (2001) measuring overall institutional quality in TEs finds out that Slovenia, Poland and Hungary outperform all TEs in institutional quality and are comparable with industrial countries.

modern conditions dictate, they will also want legal reform (Posner, 1998). For the institutional reform to take place there should be an interest group, e.g., banks, that facilitates this and pushes for reform. In early transition years banks were still not privatized and there was no political will among the banks to support rules that enhance their rights in, for instance, seizing collateral. The lending was on a soft basis and ties between state-owned banks and state-owned enterprises were still present. On the other hand, soft lending was present in the government-bank relationship. Banks were aware that in a case of distress, government will be there to provide rescue and aggressive debt collection was not necessary for their survival. As a result, the incentives of banks to strengthen their position toward the borrowers were weakened. Another explanation is that in most of the cases there were no human capital skills to deal with the new situation that the market economy had created. The courts lacked expertise and resources to do their job, while most firms were uninformed about the new laws. Balcerowicz, *et al.* (2003) have pointed out that TEs at the start of transition faced a shortage of court personnel, competent administrators and judges had insufficient knowledge of economic and financial issues. Administrative capacity and procedures were not developed at a fast enough pace to cope with rapid growth of cases resulting from the operation of the market system. However, after a decade of transition institutional reforms have taken place. Weder (2001) in measuring overall institutional quality around the world suggests that TEs as a group are no longer distinguishable from other countries, but there are large differences in institutional performance within the group of TEs. Clearly, advanced reformers in TEs now members of EU have managed to transform their institutions. The rest, such as SEE and CIS have lagged behind.

Pistor, *et al.* (2000), applying LaPorta, *et al.* (1997) methodology, point out that one of the characteristics of the TEs is that they adopted the most comprehensive laws of the western world but fell short in the implementations of these laws. The creditor rights index (ranging from 0 to 4) appears to be higher than the world average and higher than the average of all legal families (Table 1, panel a). Even the worst performers in TEs (e.g. SEE countries) scored better than the world average and average of most legal families in 1998. Similar story can be told with the World Bank methodology that extend LaPorta *et al*'s methodology for taking into account, apart from bankruptcy laws, pledge laws as well in the score ranging from 0 to 10 (Table 1, panel b). This too reflects that regarding the law on books, TEs are comparable among themselves and high income countries.

Table 1. Creditor rights in transition

	Average score for creditor rights (LaPorta et al., 1997 methodology)		Average score for creditor rights (World Bank, 2005 methodology)
	[a]		[b]
	1992	1998	2005
CEE	2.55	3.55	6

CIS	1.05	3.05	6
TEs average	1.40	3.23	6
		1996	
Common law		3.11	.
French civil law		1.58	.
German Civil law		2.33	.
Scandinavian civil law		2.00	.
World average (49 countries)		2.30	.
High income countries		.	6

Source: Pistor (2000) and World Bank (2005)

Law on books in TEs appears to have improved towards the highest level of legal rules as a result of foreign technical assistance and, for advanced reformers, harmonization requirements for joining EU.[7] The CEE and CIS countries rebuilt their systems drawing heavily on the EU and US models but the evidence from these countries suggests that the enforcement of transplanted law is often problematic (Berkowitz *et al.*, 2001). It is easy to write/copy the most comprehensive laws using the laws of developed countries as a model, but whether these are suitable and enforceable is another question. Related to this, Lopez-de-Silanes (2002) point out that the divide between developed and developing economies is more pronounced in the level of enforcement than on the laws themselves. They interpret this as either the rules are not the 'right ones' because they are not designed for judicial systems of low efficiency or low judicial efficiency renders 'the right rule' unenforceable. Many scholars support the view that a speedier upgrading of law enforcement institutions is the most important for the transition success. Hence, the EBRD recognized the need for evaluating how these laws work in practice. This led the EBRD to conduct the New Legal Indicator Survey (NLIS) with its main focus on secured transactions using a case study approach aimed at helping credit providers to assess potential advantages of taking security, highlighting strengths and weaknesses of legal framework for collateral, etc. By trying to capture commercial reality, the key concern of the survey was how effectively the process of enforcement of movable collaterals works in practice.

For the law enforcement survey a case study methodology was adopted and an imaginary case was presented to commercial lawyers in TEs (see Appendix 1 for the questionnaire). They were asked to evaluate how the bank can enforce their rights in a case of borrower default. The evaluation had three dimensions: how much, how fast, and how simply the creditor can recover the loan (amount, time and simplicity). Each of these three criteria was assessed by lawyers and EBRD legal experts in each transition country. Using a scoring system of 0 (worst) to 10 (best), a maximum score (30) can be achieved, for example, if the loan is recovered in full amount, within one month, and with clear and simple enforcement procedures.

In addition to the case study, 12 additional questions ('qualifiers') concerning the process of enforcement were asked to highlight the influence of third parties in this process. For example, to what extent the enforcement would be affected if debtor would file for bankruptcy, or how the enforcement would be affected if immovables are pledged as collateral.[8]

---

[7] As Pomfret (2002) points out, while the eastern Europeans wanted money to buy new equipment to restructure their factories, the western donors offered advice on how to construct legal systems and economic institutions.

[8] For the definition of process and scope factors see EBRD Transition Report 2003, p. 40. The scoring for process and scope factors (being in scale 1 to 3) is 1 when minor, 2 significant and 3 major problem is encountered with particular factor. As opposed to the amount, time and simplicity score, for the process and scope factors higher score indicates greater level of complexity and hence worst performance.

521

Table 2a. NLIS 2003 in TEs		
	Amount, time and simplicity	Process and scope
CEE	24.25	1.68
SEE	17.86	1.95
CIS	13.45	2.18
TE avg.	18.14	1.94

Source: EBRD (2003)

Table 2b. Tests of means (t-statistics)		
	Amount, time and simplicity	Process and scope
SEE vs CEE	-2.17*	1.57
CIS vs SEE	-0.99	1.84
CIS vs CEE	-3.87**	3.22**

Table 2a indicates that there is divergence in the enforcement of laws governing creditor rights in TEs. Not surprisingly, advanced reformers (CEE) have better scores, followed by the SEE and CIS in both, amount, time and simplicity as well as process and scope factors. Test of means reveals that regarding the amount, time and simplicity scores, the CEE countries significantly outperform both SEE and CIS, whereas the difference between the SEE and CIS is not significant (Table 2b). In the process and scope factors only the CIS has significantly worse scoring than CEE.[9]

4. LAW ENFORCEMENT IN CREDIT MARKETS IN TEs: AN EMPIRICAL ASSESSMENT

In this section we empirically assess the role of law enforcement in the credit market in a cross-section of 25 TEs by a thorough investigation of the alternative specifications of financial development. The study uses similar approach to Slavova (1999) and Pistor, *et al.* (2000) in terms of cross-sectional analysis employed and in the context of investigation i.e., TEs. But our analysis differs from existing literature on transition in many respects. First, the period under review in our analysis is after 1998 being more up-to-date and the adjustments in general environment already took place where in most of the TEs there was macroeconomic stability. As noted, from a macroeconomic stability point of view the period before 1998 may have been more volatile in TEs. This may have driven Slavova's and Pistor *et al.*'s results that found a weakened significance of the legal aspect when macroeconomic stability measures are introduced (or, as discussed, problems with their measure of law enforcement).

Second, we extend previous analysis in a broader set of dependent variables that consist of twelve different specifications employing different measures of financial development. There is no single measure that can cover entirely the degree of financial development although most of the literature employs volume of lending to private sector to GDP. This measure covers both lending to corporate and household sector. Since basis for lending are different for households and repayment rates in general are higher than for corporate loans, household loans may be less prone to legal disputes. As such, law enforcement may not have decisive impact on household lending. It may be the case that law enforcement has a different effect in two measures by having a higher impact in lending to corporate sector.

It has been shown that credit to the private sector in TEs remains well below what would be expected based on estimates for a wider range of developing and developed countries (EBRD, 2005). This is to say that TEs have not reached long-term equilibrium and that the credit growth is structurally driven from the functioning of

---

[9] In addition to the collateral laws enforcement, the EBRD in 2004 applied similar case study methodology for assessing enforcement of creditor and debtor initiated bankruptcy cases in terms of speed, efficiency and predictability.

the legal system and macroeconomic stability. Hence, countries with better law enforcement mechanisms in place will catch-up quicker. Putting simply, in countries where law is enforced properly would have credit markets that grow faster. In addition, law enforcement may have also an impact in another important aspect of financial development, which is the quality of bank loan portfolios i.e., non-performing loans (NPL). If better enforcement makes the default more costly *ex ante*, then borrowers may increase the effort in the project since they have more to loose in the case of default which would lead to lower NPL. On the other hand, the banks' portfolios may also worsen since the incentives of banks to screen are diminished when creditor rights are strongly enforced (Manove *et al.*, 2001), or if creditors are strongly protected in the case of borrower default, they will have no incentive to allow their debtors to restructure and possible premature liquidation decreases incentives to undertake risks (Padilla and Requejo, 2000).

Terms of lending are another crucial dimension of financial development. The low quality of legal institutions in dispute resolution may involve high TC due to lengthy and complicated procedures. These costs are borne by the lenders since, provided low enforcement of collateral laws, recovery value may be low. Lenders may compensate this by charging *ex ante* higher interest rates to cover these costs. Given that unpredictability of the performance of legal institutions increases uncertainty, it shortens the horizon of transacting i.e., debt contracts will be of shorter maturities. Hence, we attempt to cover these dimensions of financial development as well.

Exploring the financial development from a firm perspective is another important dimension. Cross-country firm level studies (Demirguc-Kunt and Maximovic, 1998; Fan *et al.*, 2004; Hall and Jørgensen, 2005) found a positive impact of the legal aspects on the firm leverage and debt maturity. If availability of credit is increased and terms of lending have improved, firms may face less financing constraints. Whether law variables influence firms' perceptions of financing constraints directly, firm leverage and the proportion of investment that firms finance through bank loans, would cover additional dimensions of financial development and we will try to capture in our empirical framework. If creditor rights are enforced and banks are more willing to lend, firms may face less financing obstacles, are more levered and finance the larger proportion of their investments through bank loans.

Finally, we extend the previous literature by employing a measure of the law enforcement which is specifically related to the bank-borrower relationship (enforcement of secured transactions and bankruptcy laws) that directly influences creditor expectations and their willingness to lend. As mentioned earlier, the new EBRD law enforcement measures are based on a better methodology through case study which is likely to approximate more closely the reality in practice and capture bank-borrower relationship directly. Hence, NILS 2003 (enforcement of charged assets survey) and NLIS 2004 (enforcement of bankruptcy laws) may be a better measure in this respect. In addition, apart from usual macroeconomic controls that are employed in this framework (e.g., inflation, deficit, etc.), Djankov, *et al.*, (2005) emphasize the role of credit registers in the credit market. By revealing some of the characteristics of borrowers through the credit registry, lenders reduce some of the cost of screening and they may engage in screening other characteristics of the borrower. This improves information availability, reduces risk and cost of external finance. However, unlike Djankov *et al.*, (2005) assessing the presence/absence of

credit registries, we control for the quality of registers as having an impact on the credit market development.

4.1. The model and the data

The standard model, first developed by LaPorta, *et al.* (1997) and subsequently extended by, among others, Slavova (1999) and Pistor, *et al.* (2000) for TEs, hypothesizes that the law influences financial development. The general model is as follows:

$$Y_i = \alpha + \sum \beta * LAW_i + \sum \gamma * CONTROLS_i + \varepsilon_i$$

The dependent variable is the financial sector development, usually measured by the ratio of volume of lending to private sector to GDP. In the first set of regressions (section 4.2.1), we ask whether law on books and better enforcement has an impact on the depth of financial markets measured by banks' credit to the private sector (PRIV_CRED), banks' credit to the corporate sector (CRED_FIRMS), banks' credit to the household sector (CRED_HOUSE) and credit growth (CRED_GROW). In addition, we ask whether legal indicators have any impact on the quality of the banking sector loans (NPL) - for the definition of variables see Appendix 2.

We further ask whether legal rights of creditors and their enforcement influence the terms on which credit is provided across TEs. In the second set of regressions exploring terms of lending (section 4.2.2) we regress the nominal and real interest rate (INTEREST and REAL_INT) on loans charged by the banking sector and interest rate spread (SPREAD). In this set of regressions we introduce also average debt maturity in firms in particular country (DEBTMAT). If financial markets are deeper and provide better terms to borrowers they should face less financing constraints. In third set of regressions (section 4.2.3) we explore firm financing constraints (FINOBST), leverage (LEVERAGE) and investments financed through banks (BANKFIN).

The explanatory variables include the set of variables that proxy for the quality of legal institutions and control variables. The law enforcement variable in our models (ENFORCE_PLEDGE) captures the enforcement of secured transactions laws in TEs. Similarly, the enforcement of bankruptcy laws (ENFORCE_BANKPT) is the EBRD measure of the enforcement of bankruptcy cases in TEs. Whereas, the law on books variable that proxies for the strength of creditor rights (LAW_BOOK) measures the degree to which collateral and bankruptcy laws (as they are written) facilitate lending. The Credit Information Index (CREDIT_INFO) measures rules affecting the scope, access and quality of credit information through private and/or public credit registers.

Macroeconomic stability is a standard control variable measured by inflation (INFLATION) and the government deficit (DEFICIT). In a high inflationary environment, the banking sector activity may be hampered due to the uncertainty about the rates of return on financial capital since debt contracts are usually nominal in nature. It also may influence the pricing behaviour i.e., lenders may charge higher interest rates to compensate for risk and the length of transaction. The crowding out hypothesis argues that high budget deficits may have dampening effects on the availability of credit to the private sector. Banks in TEs maintained (and still do maintain) a significant proportion of their assets in high yielding government bonds,

thus crowding out credit availability to private sector. We also control for GDP growth (GDPGROW), indicating that banks may anticipate positive developments in the real sector and respond by deepening the financial sector and extending credit to the real sector (Wachtel, 2001). This may pick up loan demand as well since in a growing economy there will be additional demand for credit. Although demand for loans may be increased in a declining economy where firms face a profit squeeze and decline in liquidity.

4.2. Regression results

4.2.1. Law enforcement, credit volume, growth, and quality

Our estimates indicate that law enforcement, specifically the new EBRD measure of enforcement of charged assets (ENFORCE_PLEDGE), has a positive effect on the volume of bank credit to the private sector (the usual proxy for financial development) which is statistically significant at the one percent level when macroeconomic stability and other controls are taken into account (Appendix 3, specification [1]). The estimated impact is also economically significant, as an increase in ENFORCE_PLEDGE indicator by one would lead to an estimated one percentage point increase in PRIV_CRED, on average. The ENFORCE_BANKPT does not have a statistically significant impact on private credit in our estimates, although it does enter with positive sign. This might suggest that bankruptcy law is less used in credit transactions and, as such, may not have decisive impact on the lending relationships.[10]

The law on books (LAW_BOOK) has no statistically significant impact on private credit. In transition context, the enforcement of laws may be of paramount importance rather than law itself, since most TEs have reformed their legal frameworks but their enforcement remained a challenge. Whereas from our macroeconomic controls only inflation is negative and has statistically significant effect at five percent level. Higher inflation is associated with a narrower credit market and this may suggest that macroeconomic instability matters and may have detrimental effect on the financial sector development. The CREDIT_INFO although with positive sign, has no statistically significant impact on private credit.

In the next specification [2] that captures bank credit to enterprises (CRED_FIRMS), ENFORCE_PLEDGE has positive effect which is significant statistically and economically. Other variables enter insignificantly in the regression and some with unexpected sign e.g. LAW_BOOK and CREDIT_INFO. In third specification that captures bank credit to households only (CRED_HOUSE), ENFORCE_PLEDGE is not significant while CRED_INFO is statistically significant at five percent level. This may support previous assertion that basis of lending is different for households which are less prone to legal disputes, hence banks rely less on law enforcement in this type of lending, while credit information gains importance.

---

[10] Claessens and Klapper (2002) find that TEs have lower use of bankruptcy laws since these are new laws and lenders and borrowers had no experience with them. They point out that firms in bank-based systems (as it is the case with TEs) tend to have close relationships with their banks and have less disbursed creditors, therefore are less inclined to use costly bankruptcy process. In addition, the authors point out that the larger the share of small firms in the economy the smaller the number of bankruptcies since small firms are less likely to incur the cost of formal bankruptcy procedures.

In specification [4] we regresses growth of banks' credit to private sector (CREDGROW). The law enforcement measure (ENFORCE_PLEDGE) has positive sign and is significantly different from zero at five percent level. Apart from law enforcement ensuring deeper credit markets, it also positively contributes to the credit market growth. Other control variables enter insignificantly in the regression, apart from inflation which is negative and statistically significant at ten percent level, suggesting that in the inflationary environments when uncertainty increases, the credit market will develop slower.

Finally, we regress the quality of the banking sector loan portfolio (NPL) on the same set of explanatory variables discussed so far [5]. ENFORCE_PLEDGE is negative i.e., the higher the enforcement of creditor rights the lower the volume of bad loans. However, ENFORCE_PLEDGE enters insignificantly in the regression. Theoretically, strict enforcement of creditor rights may have positive effect on NPL since it may reduce incentives of banks to screen. On the other hand, it may have negative effect since it makes the default costly and incentives to perform are improved. Our results do not provide a convincing evidence for neither of these theories, although the negative sign of ENFORCE_PLEDGE may slightly favour the latter. GDPGROW is negative and significant at five percent level (the only significant variable in this model) suggesting that in a declining (prospering) economy the bad loans increase (decrease).

4.2.2. Law enforcement and terms of lending

In assessing the impact of law enforcement in terms of lending we introduce lending rates as the dependent variable (INTEREST). In specification [6] we find evidence that law enforcement has a negative and statistically significant effect on lending rates. This suggests that borrowers may have access to cheaper funds where the creditor rights are more protected. Apart from the availability of credit, law enforcement determines costs on which the credit is available. The control variables, namely inflation, as expected, enters with positive sign and is significant at the one percent level suggesting that higher inflation would lead to higher interest rates in a country, since banks compensate for the risk premium that the inflationary environment creates and/or compensate for the falling value of money. CREDIT_INFO too is a negative and statistically significant at one percent level suggesting that the better the creditors are informed *ex ante* on the borrower characteristics (i.e. the better the quality of credit registers) the better terms they are willing to provide. Other control variables enter insignificantly in the regression. In specification [7] we regress real lending rates (REAL_INT). ENFORCE_PLEDGE again is negative and significant at five percent level while CRED_INFO and INFLATION enter insignificantly in the regression.

In specification [8] we regress the interest rate spread (SPREAD). The results reinforce the previous assertion that the law enforcement has an impact on the financial market development. CREDIT_INFO and INFLATION enter with expected signs, although inflation is not statistically significant. GDPGROW in this specification is negative and significant at five percent level, suggesting that higher growth leads to lower intermediation spreads. Again, ENFORCE_BANKPT and LAW_BOOK are not significantly different from zero.

In specification [9] ENFORCE_PLEDGE is not significant at conventional levels although enters with positive sign (a positive sign indicating a positive association between better law enforcement and access to longer term credit). However, when it comes to a longer period of the transactions 'information hypothesis' appears to prevail. More specifically, for longer term loans lenders may improve their screening or may be based on established relationships with their clients and rely less on collateral. This may be suggested since CREDIT_INFO enters the specification with positive sign and is significant at five percent level.[11] In this model, inflation has a negative sign and is significantly different from zero at five percent level, suggesting that in the inflationary environment the horizon of transacting are shortened, and lenders lend in shorter maturities.

4.2.3. Law enforcement and firm financing

In assessing the importance of law enforcement on firm financing, we use as the dependent variable the financing obstacles reported by firms in 25 TEs (specification [10]). Results are as expected. The ENFORCE_PLEDGE variable enters significantly at the one percent level and with negative sign. Our estimates suggest that in countries with better enforcement of creditor rights, firms are likely to report less financing constraints. Better enforcement of creditor rights may improve the availability of credit and the terms of credit, as a result, firms will face less financing constraints. All other variables are not statistically significant.

ENFORCE_PLEDGE variable enters with positive sign and is statistically significant at five percent level in specification [11] that regresses average firm leverage in countries in transition. This suggests that better enforcement of law leads to higher firm leverage, on average. Other explanatory variables are statistically insignificant except DEFICIT which is positive and significant at ten percent level. Given the presence of state owned enterprises in the BEEPS data, it may reflect the government subsidies to those enterprises in TEs. When regressing BANKFIN (last specification), ENFORCE_PLEDGE enters in line with expectations with positive sign and significantly at ten percent level. This may suggest that in countries with better enforcement of creditor rights, firms finance a larger proportion of their investment through banking sector funds as opposed to other funds.

Overall, our findings provide ample evidence that law enforcement, rather that law on books, has an influence on the development of the credit markets in TEs, after controlling for macroeconomic and other factors. Better enforcement ensures deeper credit markets that grow faster, provide finance with better terms (i.e., cheaper and in longer maturities), and ease firms' financing constraints. In addition, we provide evidence that macroeconomic factors such as inflation and systems of notice that reduce IA in the credit market i.e., the quality of credit registers, matter. These are especially important in the longer term transactions in the credit market and the pricing behaviour of the lenders. However, the law enforcement shows the most consistent results in our models compared to macroeconomic and other variables in determining the performance of the credit market.

---

[11] When regressing presence/absence of credit registries (CREDIT_INFO dummy, not reported here) as in Djankov, *et al*. (2005), the variable is not statistically significant. So, it is the quality rather than the presence of credit registries that matters in longer transactions.

4.3. Do different law enforcement measures matter?

Regarding the empirical work, we pointed out that not all measures of law enforcement reflect the reality in practice that shapes creditors' behaviour. In general, it is difficult to measure the performance of institutional aspects especially enforcement mechanisms, since they involve subjective perceptions, behavioural assumptions and different economic realities which are reflected in the different transactions that dominate the particular economy. Campos (1999) referring to 'rule of law' indicator points out that these are multidimensional measures implying the need for different measures for each dimension, and until full-fledged surveys are designed specifically to measure governance are developed, studies will have to utilize existing data with less than ideal data for that purpose.

To see the importance of the methodologies used in measuring the functioning of the legal institutions we have utilized the same regression framework discussed so far but replaced our preferred measure of law enforcement (ENFORCE_PLEDGE) with the World Bank Doing Business methodology measure of enforcement of the simple debt contract (ENFORCE_WB). Important to note is that ENFORCE_PLEDGE and ENFORCE_WB have a very low correlation coefficient of 0.01 (and insignificant). This gives an impression that different proxies of law enforcement matter and not all the proxies may be good reflections of the underlying reality. The results of the regression are presented in Appendix 4 and suggest that the simple debt contract enforcement does not have an impact on financial development, neither statistically nor economically.

In many cases ENFORCE_WB enters with wrong sign e.g., specification [4], [5], and [6]. Only in specification [10] (with NPL) does ENFORCE_WB enter significantly but with positive sign e.g., better enforcement of creditor rights leads to higher NPL. Hence, the results seem very dependent on the choice of variables measuring law enforcement which are in general difficult to measure. Our measure seems intuitively to be an improvement since ENFORCE_WB may not capture bank-borrower relationship in a classical sense. Having regarded this, and claiming that the EBRD law enforcement measure is an improved indicator, we aim at applying it for the case of Kosovo with some extensions.

5. LAW ON BOOKS AND LAW ENFORCEMENT IN KOSOVO

During the first decade of transition when TEs have tried to REFORM institutions supportive for the market economy, Kosovo went through period of Serbian regime in which virtually all Kosovo Albanians were expelled from the institutional life. Kosovo after the war under the governance of the UNMIK had to build its institutions from the scratch. Broadly speaking, no institutions existed in 1999 and administrative capacity based on previous experience was insufficient to deal with the need establishing institutions of the market economy. Basically, the laws of socialist Yugoslavia (i.e., those of 1989 and before) were in force. Under the joint administration by UNMIK and Kosovo Government, and with the help of international community either in form of technical assistance or as the part of

administrative capacity, new laws have been adopted and mainly based on the best international practices.[12]

The case of Kosovo is rather not much explored in terms of the functioning of institutional and other transition reforms, as well as the legal aspects related to finance. Due to the unresolved political status, Kosovo is not in the EBRD countries of operation, hence is excluded from the comprehensive assessment of the transition success. However, some serious attempts have been made recently in assessing the Business Condition Index for Kosovo (2005) using a World Bank Doing Business methodology (hereafter BCI) that deals with many institutional aspects that influence the operation of firms, including law on books and law enforcement related to the functioning of the financial sector. Regarding the law on books, many regulations are already in place and it may be said that these regulations follow good practices in strengthening creditors' rights.

BCI (2005) assessed law on books supportive for the functioning of the financial market regarding the legal rights as they are written in the law and contract enforcement index. For the law on books the key sources were bankruptcy and pledge law i.e., three aspects of bankruptcy law and seven aspects of collateral law (see Appendix 5 for the scoring system). Kosovo attained similar rating on the quality of law in books compared to other TEs. Regarding the countries in the region, only Albania compares better (see Chart 1 below).
Figure 1. Creditor Rights Index in Kosovo   *Figure 2. Credit information index*
Source: BCI (2005).
As we have seen previously 'information hypothesis' suggests that when lenders have more information about the borrowers it facilitates lending. BCI (2005) assessed the quality of credit register in Kosovo (see Appendix 5 for the scoring system). Kosovo scores similar to the SEE average which is behind the CEE average and high income countries (Chart 2). Compared with the countries in the region Kosovo outperforms Albania, Croatia and SCG while falls behind BiH, Bulgaria and Romania. Overall, it appears that the creditor rights are well protected in the law on books in Kosovo.

The World Bank (2004) has evaluated the 'laws in action' in Kosovo and pointed out many deficiencies in court procedures. Aspects such as the unpredictability of the judgment, the length of the process, the complexity and lack of clarity in procedures are considered as constraints in enforcing creditor rights which may encourage a

---

[12] For example, the law on Banking and Payments Authority of Kosovo, the Pledge Law, the Bankruptcy Law, etc.

culture of non-payment on the borrowers' side. In addition, based on oral interviews with bankers in Kosovo, Zahler (2004) claims that courts and judges tend to favour borrowers *vis a vis* the lenders in disputes. Again he points to poor functioning of legal institutions governing financial transactions.

However, BCI (2005) points to very favourable picture regarding the contract enforcement in Kosovo (see Appendix 5). Kosovo outperforms all TEs on average, all countries in the region and even high income countries, which is a quite surprising result. For example, in Kosovo it takes 153 days to enforce a simple debt contract, while in SEE 492 days, CEE 442 days, CIS 331 days and in high-income countries 280 days, on average.
Figure 3. Contract enforcement days
Source: BCI Kosova (2005)

It should be noted, however, that this methodology regarding the legal enforcement has its drawbacks mentioned in section 2.3 and may not capture lender-borrower relationship in a classical sense. From the methodological point of view, the EBRD is well placed in dealing with legal aspects of financial development in transition, especially legal enforcement concerning directly bank-borrower relationship. Since we are interested particularly in the law enforcement, we will limit ourselves to the EBRD NLIS case study approach since we have claimed that this measure is an improvement in this respect. In the remainder of the paper we aim to review the results of doing this.

5.1. Extending the EBRD-NLIS

In our analysis of the law, we follow Cooter and Rubinfeld (1989) who recognize four stages of the legal disputes: harm, assertion of legal claim, bargaining and trial. In the context of the bank-client relationship, the process of dispute resolution can be thought as a game between the lender and defaulting borrower. Each stage forms the expectations of recovery on the lenders' side. First, dispute can be solved by voluntary compliance i.e., where no involvement of formal institutions takes place. It may happen that most of the cases are solved in such a manner e.g., the threats that banks use upon borrower default are successful. In this phase, some amount will be recovered and it will take some time for the recovery to take place. Pistor, *et al.* (2000) point out that where voluntary compliance is high, enforcement by the state is necessary in only a few cases and thus can be quite effective – provided that a minimum level of resources is available and voluntary compliance requires a credible threat that defection will be sanctioned.

530

The issue of voluntary compliance is not addressed and explored by the EBRD since the methodology was designed exclusively to explore how the legal institutions work. The evolution of voluntary compliance may be linked to various possibilities. Agents may know *ex ante* that the law and institutions that support that law are in place. Or agents have no knowledge about the law and simply enforce contracts based on trust, care about their reputation and/or calculate costs/benefits of defaulting. On the other hand, banks may prefer not to use courts because they consider them to be slow and thus opt using other means. Hay, *et al*. (1996) point out that the legal system may not be used to resolve disputes because bad courts raise the cost of using legal system, court fees may be prohibitively high, judges may be corrupt, uninformed and incompetent, courts may be unpredictable and so it takes years to get a dispute resolved, by which time the volume of damages that might be collected falls to zero in real terms.

If institutions would make the threat of enforcement credible, then voluntary compliance outweighs the compulsory enforcement and will reduce transaction costs. By looking only to the formal part of dispute resolution is only part of the story. Of course, both formal and informal resolution should not be seen as substitutes. But rather they complement each other, specifically when formal resolution is efficient, informal one should be more pronounced.

Second, the bargaining phase can be thought of as a step before the dispute comes to formal resolution, i.e., court involvement. Again some amount will be recovered and it will take some time for the recovery to be made. Again, this issue has not been explored by EBRD. The weakest party in the bargaining phase would reveal the functioning or at least perception on how institutions are functioning. If lenders are weakest in this phase, i.e., ready to make concessions, then this may signal poor performance of institutions in the dispute resolution.

When it comes to enforcement then two possibilities exist: self-help and court involvement. If majority of disputes are solved without court involvement (with self-help), again that would reflect not so much on the effectiveness of the law explicitly. Rather, it may point to 'credibility without experience', which would have policy implications i.e., enforcement by the state is necessary in only a few cases to make the threat credible and thus can be quite effective involving low costs. As a result, we will try to make this distinction more clearly. In all these stages the issue of how much and how fast the problem loans are recovered is of importance.

The EBRD case study asks lawyers to respond to the questions how much and how fast the recovery is made by assuming there is ready market for collateral. Again, whether market for collateral exists is of crucial importance in shaping lenders' expectations on the debt recovery. We will have closer look on this issue too. The EBRD NLIS on pledges will be extended to take into account issue of voluntary compliance on borrower's side, bargaining phase of dispute resolution, more clear distinction between methods of enforcement and the existence of market for collateral will be made. The original EBRD NLIS will be kept in order to have comparable results with other countries.

5.2. NLIS for Kosovo

The EBRD NLIS 2003 methodology has been conducted with several bank officials from two largest banks in Kosovo: loan officers and legal departments. The crucial issue of the survey was how much the creditor can recover from defaulting loans through the enforcement process in terms of value, how long the recovery process is likely to take and how simple is the entire process. In addition, process and scope factors were able to be determined. It is important to note that, unlike the EBRD, in addition to legal experts we surveyed loan officers. The reason behind choosing both, legal and loan officers is that when it comes to voluntary compliance legal departments have no experience whereas loan officers are first in the line. While when it comes to court involvement, loan officers too are part of the story.

The survey results reveal that enforcement of secured transactions in Kosovo does not look bad after all. This was also the case with BCI (2005), as mentioned previously. However, the picture here is not as shining as there, but we hope is more realistic. Regarding the 'how much' question, Kosovo scores 6 out of 10; that is, lenders may expect to recover a bit above 60% of the loan with the pledged collateral. Regarding the 'how fast' question, Kosovo scores 8 out of 10; that is, lenders may expect to recover the pledged collateral within 6 months. And for simplicity of the entire process, the score is 5 out of 10. The reason that we did not score 1 (the best ranking) in simplicity is that, although the process is simple, the answer on the functioning of courts i.e., inexperienced judges to deal with the cases, the lack of special courts to deal with these cases, made the best score unlikely. The overall score for Kosovo is 19. As shown in chart 4, this is above the SEE and CIS average, but not the CEE average. From the countries in the region Bulgaria, Croatia and Macedonia are ahead. But perhaps more importantly, Kosovo is not far behind.
Figure 4. NLIS 2003 in Kosovo   *Figure 5. Process and scope factors in Kosovo*
Regarding the 12 process and scope factors, Kosovo scores 1.82 which outperforms the CIS average (2.18) and the SEE average (1.95) but not CEE average (1.68) and scores better than all the countries in the region except Macedonia and Romania (recall here lower the score better the rating). The major problems among the process and scope factors were ranked 'immovables' and 'receivables'. The score was (3) which would mean that when it comes to the enforcement process involving immovables and receivables the picture would change to a great extent and lenders would face difficulties in recovering their claims. Score (2) was attained in the creditor control, corruption, institutions and scope of collateral. The best score (1) was attained for debtor obstruction, preferential creditors, practical experience, insolvency ranking and inventory. The insolvency process was not scored due to lack of experience with the bankruptcy proceedings.

532

As mentioned, we extended the survey to capture other elements prior to legal enforcement such as voluntary compliance, bargaining, self-help and market for collateral. Survey results reveal that around 70% of defaulted loans never go to court and are solved with voluntary compliance i.e., after the 'threat' is made. In these cases the recovery is on average 60% of the amount, and these cases are solved within a period of 1 to 2 months. From the threats that banks use, the most important one is 'the bank will involve the court' and the second ranked by importance is 'the bank will confiscate the collateral'. In third place were ranked reputation considerations such as 'bank will never extend credit in the future', 'the bank will induce guarantor to pay the debt,' etc. This may give an impression of the credibility of institutions in a country or at least in the lender – borrower relationship.

When it comes to bargaining it is rarely practiced (10-15% of cases). If it is to happen, lenders are not likely to give significant concessions. For example, they may postpone a bit period of repayment but not other terms. Again, recovery in these cases is high and around 80% of the amount is recovered within 1 to 2 months. This may point to the better bargaining position of the banks, given the credibility of institutions and reputation considerations. When it comes to existence of the market for collateral (the assumption in the NLIS case study), the picture is bit distorted. From the assets pledged only 50% have a ready market and the recovery was only around 30% of loan amount and within a period of 4 months. This, however, has nothing to do with legal institutions. Rather it may suggest that banks themselves lack proper expertise in evaluating collateral.

This is not to say that enforcement does not matter. On contrary, it should be in place and credible, otherwise it increases culture of non-payment. The credibility of enforcement will decrease adverse incentives in the credit market, we will see less reliance on the courts which decreases TC compared to when courts are used. It is also the creditor passivity in demanding legal services that plays a role. Hendley, *et al*. (2000) assessing law enforcement in Russian enterprises, point out that institutional environment rewards enterprises that pay attention to the legal side of their operations. Better enforcement performance occurs when the legal staff works extensively on contractual matters, when enterprise personnel possess larger amounts of legal human capital. KCBS (2005) points out that one bank in Kosovo aggressively enforces its legal repossession and sale rights of collateral with the help of own legal staff who work closely with the judges, sometimes 'showing them how', and is quite successful.

Overall, the creditor rights on the books and their enforcement in Kosovo seems to be comparable, and in some cases better, with the countries in the region and other TEs. Nevertheless, the country is lagging behind the advanced reformers in CEE who are now members of the EU, would point that the institutional reform is under way and needs still long way to go.

6. CONCLUSIONS

Market imperfections exist and do lead to credit rationing. The collateral plays a role but if institutions are not there to ensure creditor rights, credit rationing may still prevail. More specificly, if creditor rights are protected in law on books, and more importantly, those laws are not enforced properly, credit markets will be narrower, external finance will be available on a shorter term, will be more expensive and firms will face financing constraints and underinvest. The theory and empirical literature support these assertions, however, in the transition context are not extensively studied and supported. In addition, the measures of law enforcement are important in the sense that if do not capture specific context, may be misleading.

TEs, especially those that lagged in the institutional reform, have shown to have underdeveloped credit markets. Empirical assessment in this paper on the role of institutions, specifically creditors' rights as they appear on books and their enforcement, shows that law enforcement rather than law on books matters for financial development in TEs. It is important to note that the financial development is a broader notion and has many dimensions and not just its depth is of importance as usually used in the literature. Better enforcement of creditor rights is related to cross-country differences in almost all the measures of financial development in TEs. We also show that different measures of law enforcement do not yield similar results. This leads us to conclude that it is of crucial importance how we measure the quality of institutions, which is in general difficult to measure.

After the war Kosovo build new institutions from scratch. Although embarking on transition process later, it compares well with other TEs regarding the creditor rights and enforcement. When it comes to enforcement, it is of crucial importance the demonstration effect of enforcement institutions that build credibility and trust in the legal process. The credible enforcement in turn may develop self-enforcing and voluntary compliance mechanisms. Provided that the court involvement has relatively higher transaction costs, more disputes will be resolved out of court thus economizing in those costs. On the other hand, provided that not many cases go to court little investment in enforcement mechanisms should take place for the credibility to be assured, which will have large positive implications for correcting adverse incentives in the credit market.

Appendix 1. Enforcement of secured transactions survey
Enforcement of Security Right over movables

Based on an annual survey run by the EBRD in all of its countries of operations, we have developed a slightly modified version of it with some extensions. A brief description of a hypothetical case is made and we would be grateful for your answers to the questions. The purpose of the questions is to assess the effectiveness of the law and practice on secured transactions in Kosovo. More precisely, we aim to assess the enforcement of a security over assets in terms of percentage of debt recovery, speed and simplicity for the creditor. It is presented as a case study so that answers reflect the practical position, as opposed to the letter of the law.

When responding, please:

-    As far as feasible treat it as if it is a real-life case involving a client.
-        Add any practical advice you face seeking to enforce.
-        Add also any practical advice you would normally face at the time of creation of security in order to increase the effectiveness of the security and/or facilitate enforcement. Answer assuming that these steps were taken. You would therefore assume in your answers that these specific steps (contractual clauses, special form of the document, etc) have been taken.
-        Keep answers brief: we are looking for a reasonably accurate overview, but do not expect to cover every possibility.
-        Where there is more than one method of enforcement, please cover in detail the **one** that you would recommend using, and mention briefly the other ones.
-        Assume that the loan is in Euro and that the amount (€20,000) is sufficiently high to justify a court action.

Terminology

To keep answers consistent and in order to avoid ambiguity we set out below a brief explanation of the terminology used in this case study. It would be useful if you could use the same terminology in your answers and provide, as required, an explanation of other terms used.

Charge: a right in assets to secure payment of a claim for money (same as **pledge**), given by a **chargor** (in this case the manufacturing company) in favour of a **chargeholder** (in this case the bank).

Charged assets: assets over which a charge is given (same as **charged property** or **collateral**) - in this case the production equipment and machinery and the inventory of finished products.

Enforcement: the process by which the rights of the chargeholder over the charged assets are exercised.

Realisation: the sale of the charged assets on enforcement.

Receivables: monetary claims that a creditor has against a debtor, for example amounts due for the supply of goods or services.

Secured claim: the claim of the chargeholder that is secured by the charge (same as **secured debt**).

Security: an umbrella expression used to cover rights given to a creditor to reinforce or 'secure' his right to payment.

Self-help or self enforcement means when bank enforces the pledge over collateral;
Court involvement - means when court undertakes the action in enforcing the pledge over collateral.

CASE STUDY AND THE QUESTIONNAIRE

> **Case description**
>
> One of your customers, a local privately owned retail trade or manufacturing limited company, has failed to repay a loan of €20,000. There was no invalidity to the underlying loan agreement: the default is due to cash flow problems. The debtor has thus no valid defence to the non-payment of the loan.
>
> Your customer has given you security over:
>   (1) **equipment and machinery** used in its company, and
>   (2) **inventory** consisting of finished products (Note: Assume that the equipment and machinery qualify as **movable** assets).
>
> We now ask you on how you can enforce your rights over the assets given as security in order to recover our claim:

PART 1

1) a) How can you confirm that your security is valid and enforceable? (For example, what evidence is needed of the creation or stamping or registration of your security?)

b) How can you confirm that your right to enforce has arisen? (For example, what evidence of the debtor's failure to pay is needed?)

2) What are the possible method(s) of enforcement (brief summary only)?

3) a) In respect of each of those methods: what steps do you need to take to initiate enforcement procedure (brief summary only)?

b) How long does it take to initiate the procedure? (If there is more than one method, please explain when you would use each method; please do not refer to the period as specified on the law on pledges but on actual experience).

4) If you would prefer to sell the charged assets by yourselves or at least to exercise some control on the way realisation takes place. Is this possible? Would you prefer to go down this road?

5) What will be included in the collateral to be realised?

• For example, if one of the machines included in the charge was recently replaced, will the new machine be included in the charged assets?

• If an additional machine was recently purchased, will that new machine be included in the charged assets?

• If another machine was sold, do you have a charge over the proceeds of sale?

• Part of inventory was sold and new inventory was added: would it be included?

6) You are advised that there is a ready market for the goods in the inventory and that their market value is approximately €11,000. You are also advised that there is good demand for the production machinery and that, on the basis of recent sales of similar machinery, its value is also approximately €11,000 (if inventory was not charged, assume that the production machinery value is of € 22,000). On sale through the court enforcement procedure, is the price likely to be at or near to market value? If not, please indicate the likely level as a percentage of market price.

7) a) What costs will be incurred on enforcement e.g. legal fees, executor fees, auction fees, etc. (if there is more than one method for enforcement, please give costs for each)?

b) Will they be recoverable as part of your claim?

8) How long is enforcement likely to take from start to receipt of sale proceeds (if there is more than one method for enforcement, please give time for each)?

9) a) In what ways can the debtor delay or otherwise obstruct the enforcement process?
   b) Is it likely to happen?
   c) What steps can you take to prevent this from happening?

10) Could claims of other parties affect your rights of recovery?

• For example, if the company owed tax arrears, would the tax office have a preferential claim over the charged assets?

• How about claims of employees?

• How about shareholders?

• Creditors with or without a court order or an enforceable judgement?

• Other charges, liens, retention rights or other rights arising by law?

• Other?

11) In addition to the loan amount of €20,000 your customer owes you

• €1,000 interest on the loan
• €800 penalty for breach of contract
• €200 costs for inspection of charged assets and other items under terms of our contract.

Can these sums be recovered through the enforcement procedure (please keep answer brief)?

12) You have been advised that your customer may soon be declared insolvent. Please advise how your answers would change if this were to happen:

a) prior to you starting enforcement.

b) after you start enforcement but before completion of realisation.

Despite the complexity of the matter, please try to keep your answers brief.

13) Please also advise to what extent your answers to each question would be different:

a) if the charged assets were immovable, for example a building with a market value of about € 60,000 (but not residential apartment)?

13b) if the charged assets were receivables (e.g. claims of your customer for payment from persons to whom he has sold goods)?

14) What do we need to know about how the courts and other legal institutions (e.g. bailiffs or court enforcement officers) operate in your country which has an impact on your answers and our understanding? For example, are there specific commercial courts, well equipped to handle commercial matters?

15) Is the corruptibility of the court or court officials likely to be an issue? Please provide some brief narrative as the basis of your opinion.
Which of the following statements (related to question 15) best fits to the reality in practice?

- How many charge enforcement cases have your bank handled in the past 5 years?

- Is charge enforcement common practice in your country? If not, why?

This case has been drafted in standard form to cover a number of different jurisdictions. Please feel free to add any comments on issues relevant to your country that may have been omitted or inadequately covered.

PART 2

1) Are any 'threats' used against defaulting borrower?

YES   NO

2) They are successful? _____% of cases, or

(tick one)

       always   ☐

       in most of the cases   ☐

       rarely   ☐

       never   ☐

3) Which 'threats' (please rank by importance)?

a) the bank will confiscate the collateral   ☐

b) the bank will involve the court   ☐

c) bank will recover the debt from the guarantor   ☐

d) will never extend credit in future   ☐

e) other (please specify) _____

4) From all the cases of borrowers in default that you have had, how much, approximately, (% of cases) have been solved **without court action nor self-help** (*client repaid so there was no need to seize collateral*), so after the 'threat' is made?

_____ %

5) How much the loans (in % of amount) has been recovered after the 'threat' is made
_____ % ,or

      0 – 25%   ☐

      25 – 50%   ☐

      50 – 75%   ☐
      75 – 100%   ☐

6) How fast the recovery was? (express in days or months)

_____

7) From all the cases of borrowers in default that you have had, how much, approximately, (% of cases) have been solved **without court action (collateral was seized with self-help)**?

_____ %

8) How much the loans (in % of amount) has been recovered in these cases
_____ % ,or

0 – 25%   ☐

25 – 50%   ☐

50 – 75%   ☐

75 – 100%   ☐

9) How fast the recovery was? (express in days or months)

_____

10) In how many cases the renegotiation of the terms of contract has been made?

_____%; or

always   ☐

in most of the cases   ☐

rarely   ☐

never   ☐

11) What terms are usually offered by the bank in terms of time rescheduling the repayment and amount?

12) What % is usually recovered in these cases?
_____%

13) How long does it take usually to recover the debt through renegotiation?

_____ (days, months)

14) From the debts that were in default and the action was undertaken to pledge collateral,

what is the share with self-help   _____%

and what is the share with court involvement   _____%

15) Why do you think the legal actions are not undertaken? (tick only one which is more likely)

a) **you** think that courts do not work well and you prefer self-help?   ☐

b)   **clients** are reluctant to deal with courts?   ☐

16) From the default cases that you have had, have you succeeded in selling collateral?

_____% of cases, or

always   ☐
most of the cases ☐
rarely   ☐
never   ☐
17) How long have you kept collateral without selling it? (express in days or months)

_____

18) On average, how much the amount of loan was recovered?

_____ % ;

19)   What are the legislative gaps that you usually face in the practice?

20) Related to the questions in Part 2, was the situation different say two years ago?

Appendix 2. The list of variables, their description and data sources

Variable	Description	Source
PRIV_CRED	The ratio of total outstanding bank credit to the private sector as of 2003, including households and enterprises, to GDP	EBRD (2004)
CRED_FIRMS	The ratio of total outstanding bank credit to the private sector as of 2003, excluding households, to GDP	EBRD (2004)
CRED_HOUSE	The ratio of total outstanding bank credit to the household sector only as of 2003, to GDP	EBRD (2004)
CRED_GROW	The average yearly growth from 1998 to 2003 of the total outstanding bank credit to the private sector to GDP	EBRD (2004)
NPL	The ratio of non-performing loans to total loans in 2003 which includes sub-standard, doubtful and loss classification categories by country (NPL).	EBRD (2004)
INTEREST	Lending rates are weighted averages across maturities	EBRD (2004) European Commission (2004)
REAL_INT	Lending rates are weighted averages across maturities – corrected for inflation	EBRD (2004) European Commission (2004)
SPREAD	Lending minus deposit rate	EBRD (2004) European Commission (2004)
DEBTMAT	Average maturity of loans to firms in a particular country	The World Bank and EBRD, BEEPS 2002
FINOBST	Financing obstacle variable measures how problematic is financing for the growth and operation of particular firms ranging from 1 (no obstacle) to 4 (major obstacle) and the data are average by country	BEEPS 2002
LEVERAGE	Leverage measured by percent of firms' debt to total assets, average by country	BEEPS 2002
BANKFIN	Proportion of firms' working capital and fixed investment financed through banks in percent, average by country	BEEPS 2002
ENFORCE_PLEDGE	The enforcement of secured transactions laws in TEs, as measured by the EBRD survey through case study in terms of amount, time and simplicity. The scores take values ranging from 0 to 30.	EBRD (2003)
ENFORCE_BANKPT	The EBRD measure of the enforcement of creditor initiated bankruptcy cases in TEs and the scores take values ranging from 0 to 100. Higher the score, the better enforcement of the particular law is practiced in a country.	EBRD (2004)
LAW_BOOK	The index measures the degree to which collateral and bankruptcy laws facilitate lending. It is based on data collected through research of collateral and insolvency laws supported by the responses to the survey on secured transactions laws. It includes three aspects related to legal rights in bankruptcy, and seven aspects found in collateral law. The index ranges from 0 to 10, with higher scores indicating that collateral and bankruptcy laws are better designed to expand access to credit.	Djankov et al (2005); BCI (2005)

CREDIT_INFO	This index measures rules affecting the scope, access and quality of credit information available through either public or private bureaus. The index ranges from 0 to 6, with higher values indicating that more credit information is available from either a public registry or a private bureau to facilitate lending decisions.	Djankov et al (2005); BCI (2005)
INFLATION	Average yearly inflation over the period 1998-2003 expressed in percentages	EBRD (2005)
DEFICIT	Average yearly government deficit to GDP ratio over the period 1998-2003 expressed in percentages	EBRD (2005)
GDPGROW	GDP growth rates over the period 1998-2003 and expressed in percentages.	EBRD (2005)
ENFORCE_WB	The indicator measures the time of dispute resolution—in calendar days— counted from the moment the plaintiff files the lawsuit in court until settlement or payment. This includes both the days where actions take place and waiting periods between actions. The respondents make separate estimates of the average duration of different stages of the dispute resolution: until the completion of service of process, the issuance of judgment (duration of trial or administrative process), and the moment of payment or repossession (duration of enforcement).	Djankov et al (2005); BCI (2005)

Appendix 5. Business Condition Index in Kosovo (2005)
The World Bank methodology for the Legal Rights Index, Credit Information Index and Contract Enforcement – Explanatory Note

Legal rights index: The index measures the degree to which collateral and bankruptcy laws facilitate lending. It is based on data collected through research of collateral and insolvency laws supported by the responses to the survey on secured transactions laws. It includes three aspects related to legal rights in bankruptcy, and seven aspects found in collateral law. The index ranges from 0 to 10, with higher scores indicating that collateral and bankruptcy laws are better designed to expand access to credit. A score of 1 is assigned for each of the following features of the laws in Kosovo:

Secured creditors are able to seize their collateral when a debtor enters reorganization-that is, there is no "automatic stay" or "asset freeze" imposed by the court. 0

Secured creditors are paid first out of proceeds from liquidating a bankruptcy firm, as opposed to the other parties, such as government or workers. 1

Management does not stay in reorganization. An administrator is responsible for managing the business during reorganization, rather then management of bankrupt debtor. 1

General-rather then specific –description of assets is permitted in collateral agreements. 1

General-rather then specific –description of debt is permitted in collateral agreements. 0

Any legal or natural person may grant or take security. 1

A unified registry includes charges over movable property operates. 1

Security provides priority outside of bankruptcy. 0

Parties may agree on enforcement procedures by contract. 0

Creditors may both seize and sell the collateral out of court. 1

Summing up these scores, gives the value of legal rights index for Kosovo of 6.

Credit information index: This index measures rules affecting the scope, access and quality of credit information available through either public or private bureaus. The index ranges from 0 to 6, with higher values indicating that more credit information is available from either a public registry or a private bureau to facilitate lending decisions. A score of 1 is assigned for each of the following six features of the credit information system in Kosovo:

Both positive and negative credit information is distributed. 1

Data on both firms and individuals are distributed. 1

Data from retailers, trade creditors and/or utilities as well as financial institutions are distributed. 0

More than five years of historical data is preserved. 0

Data on loans of above 1 percent of income per capita is distributed. 0

By law, consumers have the right to access their data. 0

This gives the Credit Information Availability Index for Kosovo of 2.

Questionnaire on enforcing contracts

The purpose of this questionnaire is to collect basic information about litigation practices. The questionnaire is based on a hypothetical case, which has to do with the collection of a returned check (invoice).

There is scenario which assumes that the plaintiff (creditor), a small merchant, delivers some goods to the defendant (debtor) worth the equivalent in local currency of € 2,000 (or 200% of GNP per capita of Kosovo). Defendant tenders a check from his or her personal bank account in full payment of the amount owed. The check complies with all formal requirements and is entirely unconditional. The creditor timely presents the check for payment and the bank rightfully refuses to pay it for insufficient funds. Plaintiff and defendant reside both in the largest city of the country, and the check is from a local bank. There is no doubt that the underlying transaction was legal and that the plaintiff fully performed his/her part (100% compliance). Plaintiff files a lawsuit, which includes the original check returned by the bank (if necessary). Given this scenario and the assumption given above regarding this component, this questionnaire describes step by step the process for collecting a check (invoice).

Time (days): The indicator measures the time of dispute resolution—in calendar days— counted from the moment the plaintiff files the lawsuit in court until settlement or payment. This includes both the days where actions take place and waiting periods between actions. The respondents make separate estimates of the average duration of different stages of the dispute resolution: until the completion of service of process, the issuance of judgment (duration of trial or administrative process), and the moment of payment or repossession (duration of enforcement).
Based on laws, these procedures in Kosovo take 65 days to complete, but in practice it usually takes 153 days. In the BCI we present the last figure.

AN EQUITY GAP: DOES IT REALY EXIST IN SLOVENIA?

Abstract

Venture capital is recognized as one of the key catalysts to stimulate creation and growth of innovative and high-growth potential entrepreneurship. However, transition economies suffer from the lack of tradition of equity financing which is one of the main pillars of modern economies. The supply of equity capital is low. On the other side the demand for the equity type of financing remains a big question mark.

Some previous research on equity financing done in Slovenia shows that demand for this type of financing is low. Some evidence derived from secondary data is backed-up by more qualitative methods of collecting and analyzing primary data such as interviews with entrepreneurs and experts, focus groups, case study analysis, etc.

Preliminary results show that market failure of the equity finance market is difficult to be proved. Thus, it seems to be impossible to point out the supply or demand side causality for the existence of the market failure. Therefore, the shift of the market equilibrium to the higher quantities may be facilitated in different ways for supply and demand side. According to this a robust estimation of the size of the market after the facilitated shift of quantity is provided.

The most important contribution of the study will be extended understanding of the equity capital market in Slovenia and pointed out possible solutions for its further development.

1. INTRODUCTION

While debt financing is the most important source of European enterprise finance at least over the past decade, alternative instruments can become a significant factor in providing

flexibility and choices that better reflect the needs of enterprises throughout their development (Cristofidis and Debande, 2001). Venture capital (VC) is likely to become the most important option for specific knowledge based and growth oriented types of SMEs.

The experience of venture capital in the USA shows that different forces call for an increasing share in venture capital financing, either in the form of (formal) venture capital funds, business angels or existing corporations through their capital venturing. Experts used to stress the »equity capital culture« when explaining the strength of VC in the USA and Great Britain (Cumming and MacIntosh, 2004). However, according to some empirical evidence it is not only a true entrepreneurial Anglo-Saxon culture but government support for this type of capital with appropriate regulation and tax policy that is needed. The US government supported innovative SMEs through SBICs (Small Business Investment Companies), tax-policy-preferred capital gains while, in 1978, pension funds were allowed to invest in VC funds. Along with the »silent revolution« involving entrepreneurship and changes in technology, this support has seen growth in the amount of traditional venture capital from around USD 5 billion in the mid-1990s to USD 101 billion in 2000, with an even larger amount of USD 129 billion in informal investments (Bygrave, 2001). VC has also developed a viable organizational structure of partnership management companies that are rewarded according to an investment's success. The European Commission (2001) expressed its commitment to risk capital as a reflection of its concern over the high level of SMEs' dependence on debt finance, as part of efforts to create an entrepreneurial Europe. However, EU countries have trailed behind the development of VC in the USA (Romain and Van Pottelsberghe, 2003) and the economic slump in 2001-2002 seriously aggravated the situation in the venture capital market for both SMEs and VC funds (Himelstein, 2001). Yet, we can assume that following economic recovery VC will again become more important at least for certain types of SMEs or enterprises in certain stages of their existence (Hermann, Liebig and Tödter, 2004). This is very important since VC has backed those companies that have really made technology breakthroughs (Himelstein, 2001). The study of VC-backed firms in Europe shows that VC was an essential ingredient of their creation, survival and growth, while 60% of these said they would not be in business today without the funding and support of venture capitalists. Venture capitalists were seen as contributing much more than finance, for they also provided strategic advice, networking opportunities, credibility and offered a sounding board for new ideas (Mayer, Schoors and Yafeh, 2001).

Transition countries lag behind these VC developments and are still extremely occupied with the problems of bank finance. This is still the case with Slovenia, the most developed transition country, albeit having lower entrepreneurial activity than other EU countries. Improving commercial banking and access to debt capital by reducing the cost of capital and introducing more friendly procedures (Glas, Pšeničny, Vadnjal, 2002) is the key issue for SMEs. However, what is true for average SMEs in general may not be as relevant for dynamic, fast-growing companies that are really the target for venture capital. Slovenian banks and other investors as the supply side of venture capital started early in the entrepreneurship wave of 1990s to become involved in some types of VC investment. However, problems arise more from the demand side and. In addition, the legal, administrative and tax environment is not conducive to such investments. Because of the overall low development of capital markets, one of the main obstacles seems to be the lack of exit possibilities which make the VC market liquid and thus attractive for investors (Seagroves Jr., 2006).

2. DEMAND POTENTIAL FOR VC IN SLOVENIJA

The final objective of the research of the demand side of the venture capital or private equity market has to be ability to estimate the extent of demand for venture (private equity) capital. We derive from the opinion, that demand for venture capital is defined by three groups of factors (Schertler, 2002): (1) the level of entrepreneurial initiative of individuals, (2) innovation potential of the economic environment, with the resulting number of innovative ideas with ambition for entrepreneurial implementation and (3) institutional environment, making decisions on number and terms of financing innovative ideas. Saertre (2001) states, that it is a typical inductive research, where pattern builds on theoretical selection, being more desired and appropriate in comparison to coincidental selection, which is basis of deductive research. A »loose structured interview« is the most adequate format of collecting data, recommended in literature (Miles and Huberman, 1994). It enables a sufficient quantity of information for a quality development of theory and hypothesis (Andersen, 1997), as well on the field of financing with private equity, discussed in this research.

Marino (2006) states that, it is often very difficult to say precisely from where the initiatives for investment projects (deal-flow) come. He quotes many sources, but for none of them he is not confident to make an assertion, which source would be prevalent or what may be the proportion of deal-flow coming from each source: (1) direct contacts between entrepreneurs and investors, (2) formal associations, (3) connecting more funds, (4) informal connections, (5) private agents, (6) institutions of the support environment for entrepreneurship and (7) incubators. Some older data show, that half of proposals for investments into funds come from private or public agents (Murray, 1994), which are different institutions, supporting entrepreneurship and small businesses as a market or a public good. Harrison in Mason (1996) argue that local centers for support and promotion of entrepreneurship and SMEs, which already provide some services that already interleave with some typical functions of management of funds (preliminary due-dilligence), can play an extraordinary important role. Regarding all these facts it seems to be reasonable to regard these institutions as satisfying and significant sources of information to asses the demand side of the venture capital market. However, it turns to be a great research challenge to try to measure and evaluate something that hardly exists and put efforts to predictions of further development. Thus, confirmation of existence of equity gap at the market with really small quantities, appears to be problematic, which is consistent to some previous research (Freshwater et al., 2001).

We estimate that the selection of companies, founded and nursed in technology parks, business and university incubators on one side and spin-off potential on the other side, is correct, as in both cases at least two out of the three conditions, as described by Schertler (2003), are met. Numerically it is a relatively small pattern, which speaks to benefit of the quality research approach. Experiences from the research in the past (Vadnjal and Glas, 2003) argue against the quantity research approach, as it turned out that random selection of a larger number of companies in order to interview them about the venture capital is unreasonable. As we have to deal with two theoretically different concepts, a pre-formulated content of the interview is structured only for the part, where we want to collect quantity data in order to make a rough estimate on the extent of demand for venture capital.

3. METHODOLOGY AND PROPOSITIONS

Complementary operations of business incubators, assuring favorable pre- and start-up environment for new ventures and venture capital for start-ups and early growth, should be the key generators of potential economic growth and regional development (Kjaergaard and Nordstrum Borup, 2004). This statement appears to be consistent with some more anecdotic data on history of deal-flows. Only between 20 and 30 investments (exact number is hard to define) by institutional investors to unquoted companies have been made in Slovenia since 1994. However, the part of this relatively small amount may be considered also to be invested in some privatization companies and spin-offs in the transition period of economy. So, many of these investments may be better defined as private equity rather than venture capital investments. The majority of remaining investments were backed-up also by incubators and technology parks etc. Having also in mind that these elements of support environment have been given additional government assistance recently and that their efforts should be more focused on technology based companies, also to catalyze the underdeveloped venture capital market which is consistent with the efforts done on the level of EU (Da Rin, Nicodano and Sembenelli, 2005). Thus, it is from the viewpoint of research methodology reasonable to expect that their leading personal may be the prevailing sources of information for our research.

Out of the studied references and previous research combined with some anecdotic evidence, we put forward the following propositions to be confirmed or rejected in the following qualitative analyses:

P1.   The existence of equity gap is difficult to be proved in Slovenia.
P2.   The level of knowledge about equity financing is low both among entrepreneurs and professional who assist and support SMEs
P3.   The paradigm that technology parks and incubators can be important source of deal-Flows for venture capital investments cannot be proved for Slovenia
P4.   The venture capital market can be improved by government intervention only through simultaneous actions of cash supplies and soft support

Eleven interviews were conducted to collect the data. The list of interviewees is provided in table 1. The interviews were taped and transcribed with the interview. Different segments of opinions and statements were grounded manually with the assistance of word processor.

Table 1: A list of participants in the research

Institution	Name	Position
University incubator of Ljubljana – LUI	Borut Strle	director
University incubator of primorska – UIP	Iztok Škerlič	director
Venture factory – University incubator Maribor	Matej Rus	director

Technology park – Štajerska	Tanja Senekovič	director
Technology park – Primorska	Rajko Kerševan	director
BSC Kranj	Bogo Filipič	director
PI – business incubator Murska Sobota	Marko Močnik	director
SIC Slovenske Konjice	Jože Šelih	director

Source: own research

The demand side of the venture capital market, is estimated from the following aspects: (1) potential needs for venture capital, (2) the extent of funds demanded on the short-run by entrepreneurs in technology parks, business and university incubators in Slovenia, (3) potential chances for venture capital investments in institutions of innovative environment, (4) willingness of companies within institutions of innovative environment to admit equity capital from the government, (5) interest of companies, which want to get venture capital, that the owner is the state or private venture capital fund, (6) willingness of companies within the institutions of innovative environment to sell the control share of the company to the venture capital funds, (7) needs of the companies for additional knowledge and HR on the fields of marketing, finances, technologies, different connections and acquaintances and (8) desire and interest of companies with venture capital to take over the control share of the company after a certain period of time from the venture capital fund.

4. DEMAND IN TECHNOLOGY PARKS AND INCUBATORS-BASED COMPANIES

4.1. Potential needs for venture capital

Demand for venture capital in companies within institutions of the innovative environment is in Slovenia modest. We are facing already in the start, like on supply side, as well on demand side the same kind of problem. It is difficult to complete a quantity estimate on the basis of qualitative research, as it is methodologically controversial. Thus, we find it appropriate to present the findings in a more descriptive manner. We still aim to quantify the data which have to be regarded as very robust.

There are three university incubators in Slovenia. At university incubator in Ljubljana, the demand for venture capital in the period from 2007 – 2008 is estimated **from 2,5 to 10 mio Eur.** At Primorska university incubator they have started to provide the necessary infrastructure and support and are preparing tender for potential companies in incubator, from this reason the demand for venture capital cannot be assessed yet. In university incubator in Maribor the estimate of demand for venture capital for the future two years is **1 mio Eur**. Technology parks (ŠTP Štajerska, TP Primorska, BSC - Kranj), with the exception from TP Ljubljana, mainly have had no experience with venture capital. However, they are still sure that there is a certain interest for financing investments with venture capital among the companies based at their institutions. In TP Ljubljana demand for venture capital in the near future is estimated to **8 mio Eur**. In business incubators (Murska Sobota, Smartstart) they estimate demand for venture capital from technology-based and high-tech companies from **50 to 300 thousands Eur** per project. The total funds can not be estimated because their plans about the number of companies which may be hosted in the incubator seem to be inconsistent. In business incubator of Murska Sobota they have accomplished analysis of the interest for investments of venture capital and from 34 companies from the incubator and 20 other larger companies only three companies are willing to accept venture capital as the source of financing and to renounce ownership in the company.

The extent of demand for venture capital is difficult to be assessed on a long term. On a short term we estimate that extent of venture capital supply exceeds the extent of venture capital demand. Our interviewees share the opinion, that venture capital demand could be increased by the following intensified processes:

- Entry of venture capital in the seed and start-up phase

- A chance to enter with smaller minimum amounts

- Raising mass-awareness of the interested public (entrepreneurs, consultants, professors) about venture capital in order to reach higher level of understanding the meaning of venture capital, knowledge, which enters companies with venture capital, chances of venture capital withdrawal, chances to take over the control share of the company

- Long term presence of venture capital in companies and cooperation in later phases of financing, when capital is needed for further growth

- Stimulating development – strategic alliances with companies abroad

4.2. The extent of funds – venture capital demand in innovative environment.

In university and business incubators, according to our interviewees, they have assisted together with the two most active venture funds, so that more projects in total value of **18.58 mio Eur** were financed. In three cases investments range between **1,2 and 6 mio Eur**, in other cases investments range from **10.000 to 300.000 Eur** in technology-based and high-tech companies. From this evidence, it is very clear that the average amount for investment is not comparable to the amounts that are more common in the environments with more developed VC markets.

Interviewees emphasize that entrepreneurs are technically well educated and highly skilled, but they do not know enough or do not understand different kinds of financing. Venture capital is not a recognized form of financing in Slovenia. There are not enough positive examples and best practices, entrepreneurs fear to let new owners enter their companies. In incubators and technology parks they have already organized presentations for entrepreneurs.

Annual returns of projects financed with venture capital differ from project to project and reach from 19% to 35%, according to interviewees. There is no evidence of venture capital withdrawals. As possible forms of withdrawal IPO, MBO and M&A and as an average exit period three to six years are mentioned. However, the expected returns are the reflection of respondents' personal opinion rather than more sophistically quantified data.

Incubators have mainly assisted entrepreneurs with business plans, preparing presentations for potential investors and establishing contacts with venture capital funds, searching partners for cooperation while composing final financial constructions of investments. Some incubators offer entire services on this field to their clients.

Some of the projects have not been implemented yet, some have proved successful, and some have failed due to too big investments or too small returns. One of interviewees mentioned, that entrepreneurs are not capable to attract buyers, to make them enthusiastic about their products, to persuade partners for further cooperation. In incubators they estimate, that projects could be more successful, if entrepreneurs would let them be involved with their knowledge and experiences, searching for synergies, network, in marketing and in opening the doors.

4.3. Willingness of companies to admit equity capital from the venture funds, to sell the control share of the company to venture capital funds.

From our discussions with representatives of different institutions we can husk, that comparing to times of three to four years ago, high-tech entrepreneurs accept the fact that they should make big steps already at the beginning to build barriers for competition. This leads to letting fresh capital and new owners in their companies. More and more of Slovenian companies (in the recent six months they report two such companies in the university incubator of Maribor) are seeking venture capital with the funds located outside the borders of Slovenia (Germany, USA). It is not only about money, it is about assisting them while negotiating with potential buyers. The main weakness of Slovenian entrepreneurs seems to be that they fear to think big and to »assure« high returns, demanded by the venture capital funds. We can establish, that it is characteristic for Slovenian entrepreneurs, that they do not want to give up the control share of their company, as they do not understand, that venture capital (depending on the strategy fo a particular fund) can be active in sense of mentoring, discussion partners, door opener, integrator to business networks etc. According to one of our interviewees »it is impossible to integrate the venture capital concept into exceptionally non-entrepreneurial culture«.

A typical technology-based company is not willing to share the ownership, but it is more opened to strategic alliances, especially such which are opening markets and to classic ways of financing. We can say, that in Slovenia, there is a lack of entrepreneurs who would have a aspiration for the fast growth and capital harvesting of their venture. It seem that ambitions of Slovenian entrepreneurs tend to be more in job-creation for them and potentially for their family members, rather than building a company which would in the future have its own trade value.

Our research can be complemented with findings of the researches, implemented in the recent years (Glas et al., 2002, Vadnjal and Glas, 2003), when we were interested in venture capital done in Slovenia. Venture capital has been on disposal in modest extent, formally we have had only 5 or 6 funds, but really successful entrepreneurial projects could enter international capital market, where there were no such limitations. Limitations for growth of venture capital investments are well known (Žugelj et al., 2001), so we have asked entrepreneurs about the returns on their investments. Almost half of them have not thought about it, less as 10 percent have looked for outside investors or they have invested into other companies. Entrepreneurs especially reject the state funds (unacceptable for 31 %, acceptable for 23 %, others would be inconvenient); the idea about private investments is more appreciated (unacceptable for 21 % of SMEs, would not disturb 29 % of entrepreneurs).

It has turned out that some of the factors are typically connected with the level of education. Higher educated entrepreneurs are more opened for external investments. Age of entrepreneur is important as well. Entrepreneurs are proportionally realistic when estimating, which forms of (non-financial) support could be expected from external investors. It is mostly about supporting the market activities and different managerial activities. They do not want to become financially dependent from investors.

4.4. Needs of companies for additional knowledge and HR on the fields of marketing, finances, technologies, different connections and acquaintances.

A huge problem, being exposed by our interviewees is that entrepreneurs, who generally have a very high level of technical-technological knowledge, need help of professionals, who would check for them their new, unproven technologies at the market, and would prepare independent studies about the market potentials. It is a problem how to finance such studies, as well.

Entrepreneurs are aware of the intellectual property rights problems. In Slovenia there is a lack of professionals, who could assist entrepreneurs in this field (it is not only about the procedure of formal application for a patent, it is more about assisting entrepreneurs when deciding about protecting their intellectual property). The best protection before competition is a fast and continuous development, which enables to entrepreneur to be a step in front of competition. However, to be able to understand and perform this, more than just technical knowledge and skills is needed.

Entrepreneurs are aware that success depends on their ability to attract partners, customers, suppliers, from their capacity to make them enthusiastic about their products. There are more and more entrepreneurs, who seek for knowledge and experiences, assistance at marketing. Opening doors and searching for synergies in institutions of innovative environment seems to be more and more important.

Table 2: Stimulative or breaking factors for admission of external capital in SMEs

Factors influencing SMEs actions	**Stimulative (%)**	**Neutral (%)**	**Breaking (%)**
Factors in legal and tax environment			
No tax incentives for investors	5	26	68
High income tax levels on capital earnings	6	28	67
Complex and expensive changes of ownership relations	4	32	64
Factors, relating to possible actions of investors			
Investors want to cash-in profits, although to damage of the company's liquidity	7	21	72
Investors not ready to wait for appropriate returns	5	24	71
Investors want to have for small investment to big control	6	30	64
Factors of managers' actions / entrepreneurs in SMEs			
Entrepreneurs want to have cars, mobile phones and other things at the account of the company	5	35	60
Uncertain entrepreneurs due to weak legal and financial knowledge	5	28	59
Management style of entrepreneur is to do everything alone (»lonely wolf«)	13	28	59
Entrepreneur fears outflow of important information	5	36	59
Entrepreneur does not want to grow at all	8	36	56
Tendency to use accounting to hide profits	9	42	49
Desire of entrepreneurs to keep the life style	17	37	46
Desire of entrepreneurs to entirely control the company	29	21	50
Attitude of companies towards the idea about investment	48	39	13
Obstacles at the financial market			
No real chances for investors to withdraw from the company	4	48	48
Higher return of other financial investments	18	41	41
the level of trust between entrepreneurs and investors	60	23	17

Source: Calculated from Glas et al. (2002), page 26; Glas, Drnovšek and Pšeničny, 2002, page 9

4.5. Interest of companies with venture capital for taking over the control share of the company from the venture capital fund after a certain period of time.

There is no evidence of a single realized exit of venture capital from a company. In one case the exit is planned entirely by selling to the buyer of services, in one case it is planned as MBO, in two cases it is planned by M&A. We have not tracked any trials of the repeated taking over of the control share in the company.

From the character of the Slovenian entrepreneurs, who are enviously keeping their knowledge and ideas, their property, and they do not want to share or admit equity capital in the company, we can derive that if they accept equity financing as a source, they will tend to have ambitions to take over the control share again or to sell their share.

5. CONCLUSIONS AND RECOMMENDATIONS

The following propositions were put to confirmation in this paper: (1) The existence of equity gap is difficult to be proved in Slovenia; (2) The level of knowledge about equity financing is low both among entrepreneurs and professionals who assist and support SMEs; (3) The paradigm that technology parks and incubators can be important source of deal-lows for venture capital investments cannot be proved for Slovenia, and (4) The venture capital market can be improved by government intervention only through simultaneous actions of cash supplies and soft support. From the knowledge and understanding received from the collected date from interviews, all the propositions can be declared as confirmed.

In Slovenia, the VC market is still almost in its nascent or emerging phase. There are few VC funds and their managers, with some exceptions, are still gathering their first experiences in deal closing and in further assistance to management. Entrepreneurs are generally reluctant to engage in equity investments but in some high-tech and innovative start-ups or fast-growing firms they have recognized VC as being the only real option due to the highly risky investments involved.

From the mentioned around 20 VC investments in Slovenia formal equity investment is proving to be a viable financing option for growth-oriented, dynamic entrepreneurs. However, private equity financing is also time-consuming for entrepreneurs. It is almost a prerequisite to have at least two in the entrepreneurial team if a start-up decides for this type of investment. Evidence shows that during the due diligence process and after the actual entry it takes at least one person to co-ordinate outside investors, whereas the rest of the entrepreneurial team has to undertake business operations. It seems that a private equity investment is more valuable than in financial terms in capacity of building up the management know-how that is a prerequisite for the further growth and internationalization of a young start-up. Thus, the most important expectation on the side of entrepreneurs from private equity funds is support in building up the legitimacy of their businesses. Second, young businesses backed by a formal private equity fund have to develop their business philosophy and focus faster than their counterparts, which in return enhances the formation of their organizational structure and culture.

The general opinion of private equity investors is that there are many excellent business opportunities identified by Slovenian start-ups. However, due to the very limited local market,

only start-ups exhibiting a very dedicated growth focus and global reach can be considered for investment engagement. Since previous empirical research on the state of the art of Slovenian small business showed a relative shortage of dynamic businesses in Slovenia, it follows that the scope of private equity financing in Slovenia is quite limited. The second barrier to private equity financing is regulatory. The current business legislation does not promote this type of financing with tax incentives for private equity placements. Further, business legislation regulating management reward systems does not give many alternatives for the exit strategies of formal private equity funds. Together with the underdeveloped Slovenian financial market, the former seriously hinders this type of financing.

Finally, the latest developments in global venture capitalist markets show that the focus of formal private equity financing may shift from first-phase financing to later development stages to finance mostly business expansions, although some funds are persisting with their early stage orientation. On the other hand, financing the early stage companies with lower amounts may be recognized as a niche for potential public fund which is planned by government.

Slovenian social culture is far from supportive for VC investments. It is difficult to bring several Slovenians (outside the family) together to co-operate, team building is therefore a difficult task. Slovenians are not open enough for communication, they do not easily accept other people's advice, and this throws up psychological barriers to the VC culture. In addition, opportunities to earn good returns from stock speculations on the Stock Exchange in the wake of M&A processes are likely to be further limiting the capital amount available for equity investments in new and unquoted SMEs.

The venture capital market is also specific for being small and will remain small on both sides: there is smaller number of entrepreneurial projects and there are smaller amounts of venture capital available. The amounts of money that may fill some new venture capital fund are under question mark. Another problem is seen as a lack of exit possibilities for investors. There is no market of shares in the companies and there have only been a few IPOs since the Stock Exchange has been established. Therefore exiting and harvesting strategies are very limited.

Legislation is another emerging challenge regarding venture capital in Slovenia. There is no attractive tax and other incentive for investors and legislation puts very rigid limitations about investment to banks, insurance companies and pension funds. The process of establishing a new venture in Slovenia is unfortunately still quite complicated and expensive.

The Slovenian government itself has been considering of playing more active role in venture capital market although there have been serious argumentation against active government's intervention on the VC market (Lerner, 2002). A certain amount of funds is planned for investments in new hi-tech start-ups. Evaluating government's progress regarding access to finance appears to be a difficult task. However, the whole bunch of activities offered by the different public bodies in Slovenia show, that there is a strong commitment for positive change towards more dynamic SME finance structure, which is a condition for a qualitative shift in SME sector. The majority of Slovene companies are micro enterprises with only few expressing growth ambitions, which are of course not possible without a stable supply of different forms of finance.

Financial markets have been regulated by governments to prevent different economy shocks on one side, but also to support economic growth. If we agree with the paradigm that growing dynamic enterprises are the most vital part of modern economies, than state with its public players should hand in hand with commercial finance providers enable a really stimulating entrepreneurial environment where finance is probably most important but the Global Entrepreneurship Monitor (GEM) which was first evaluated in Slovenia in 2002 shows that people in Slovenia are not very eager invest equity in companies. Among 34 surveyed countries only China performed worse than Slovenia regarding percentage of GDP invested in companies. A little bit better performance has been shown for non-formal investment of business angels, which rank Slovenia on 23rd place among 34 surveyed countries.

1. INTRODUCTION

Franchising as a way of doing business is often used in economically developed countries, and its use has grown dramatically over the last two decades in both the USA and Europe (Alon & McKee, 1999). A 2004 study of franchising's economic impact conducted by The International Franchise Association showed that the franchise market in the USA generates over $1.4 trillion (i.e., over 45% of total retail sales) with 18.6 million people directly and indirectly employed (IFA, 2004). Research conducted by the European Franchise Federation in 2004 indicated that there were more than 5,500 franchisors and more than 266,000 franchise locations in Europe (EFF, 2004). According to the same research, the USA and Asia have around 4,000 franchisors each.

Franchising as a way of doing business is suitable for two types of companies:

- Those that want to "grow" in a geographical sense and not rely exclusively on their own financial resources. These companies become franchisors and sell the rights-of-use of their established brand names and developed know-how to local companies in targeted areas;

- Those that want to enter certain industries but as a part of bigger systems. These companies become franchisees and buy rights to use established brand names and to use established models for ways of doing business in certain business fields.

The franchising literature indicates the numerous advantages, disadvantages and challenges of franchising from both the franchisor and franchisee points of view. However, there is limited evidence about the status of franchising in Croatia regarding the number of Croatian companies which are part of international franchising networks and the number of Croatian companies which became franchisors together with results of their business.

The present paper discusses issues related to the implementation of franchising business models in Croatian companies, using The San Francisco Coffee House as a referential case. The paper investigates the potentials, barriers and significances of adapting franchising concepts on a microeconomic level.

This study explores the condition of franchising in Croatia, aims to contribute to the body of evidence about Croatian franchising, and contributes to theoretical research on international franchising. Therefore, a number of the stakeholders will benefit from this investigation: managers, investors, potential entrepreneurs, service providers (financiers and advisors), policy makers, and theoretical researchers.

2. BACKGROUND

2.1. Franchising - origin and definitions

The word "franchise" comes from the Norman French word "fraunchise," which was derived from the French word "frank" – free man, free to work something.[1] The English word "franchise" originally was used to describe liberation from any prohibition, permission, or privilege – by which a company is allowed to do or not to do something for which it would normally not have rights.

Franchising is a privilege or allowed right given to an individual or group that allows recipients to do certain commercial activities. It is a way of widening a given business's field, including the right to distribute products and services under a better-known brand name. Franchising can be divided into two main types: product/trade-name franchising and business format franchising. According to Falbe & Dandrige (Alon, 2006, p. 43), product/trade-name franchising is a distribution system in which suppliers make contracts with dealers to buy or sell products or product lines. Business format franchising is a continuing relationship in which the franchisor provides a licensed privilege to do business—plus assistance in organizing, training, merchandising and management—in return for a consideration from the franchisee (Alon, 2006, p. 12). In other words, a franchise occurs when someone develops a business model and then sells the rights for doing business under that model to another entrepreneur, the franchisee. The entrepreneur who sells the rights is the franchisor. The franchisee generally gets the rights to the business model for a certain period and within a certain territory.

(*The word frank comes from the word "Frank," which described members of German tribes who lived in Gallia in the 5th century C.E.. In Gallia, which was under the Francs, only they – invaders – had full freedom as well as the ones who were under their protection. In old European law there was an expression "Francus homo" which was describing free citizens)*

2.2. Franchising's advantages and disadvantages

As in any potential business arrangement, the sides involved need to ask questions about the advantages and disadvantages of the nascent relationship. There are numerous advantages for those entrepreneurs who choose franchising as a growth option: Murray (2003, p. 15) has emphasized faster growth, the development of better managerial skills, and benefits that accrue from local knowledge. Other advantages include minimizing business and financial risks to the franchisor, fewer employees in the field and less administration in the main office(s), and the faster establishment of a national image for the company - because of franchise-system growth. As a result, the challenges associated with competition are diminished.

Parivodić (2003, p. 54), states that the biggest disadvantage for a franchisor is the potential loss of the control over the franchise network. Murray (2003, p. 17) states further disadvantages specific to the franchisor: the dangers of franchisees not sticking to the franchisor's standards, the potential for a less profitable business, potential conflicts with franchisees, and lack of trust between the parties. Since the employees have the biggest role in a given franchise's potential for success, another disadvantage is related to the fact that the franchisor cannot influence the franchisee's hiring policies, though some franchisors do mandate (or try to mandate) training and adherence to certain work rules throughout the franchise network.

The franchise relationship would not develop if a potential franchisee did not see advantages to conducting business using a field-tested business recipe and under the known name of the franchisor. Some of the advantages for entering the franchise network from the franchisee's point of view are overcoming shortfalls of knowledge and experience compensated for by training provided by the franchisor, using a successful and established business name and reputation, retaining a certain level of independence as an entrepreneur, and realizing the group benefits of economies of scale (Spasić, 2006, p. 28).

Other authors note additional advantages: lower risk of failure, standardization of product and quality, help in choosing location(s) and other logistical activities, benefits from the franchisor's research and marketing program(s), and some protection from competition.

Thomas and Seid (2000, p. 39) have observed significant disadvantages for franchisees: lowered independence, greater addiction to franchisor's non-elastic franchise system, and unrealistic profit expectations. For some franchisees, an additional disadvantage is the obligatory, continuous coordination of contracts and standards that are prescribed by the franchisor and the franchise system, including those financial obligations which the franchisee has to pay regardless of his actual financial status.

3. ENVIRONMENTAL ANALYSIS OF FRANCHISING IN CROATIA

3.1. The Economic Environment of Franchising

In the beginning of the 1990s, after The Republic of Croatia gained its independence, the Croatian market opened to a great variety of international products and services. Due to the economic growth which began in the late 1990s, salaries have grown appreciably, especially

in the larger cities and in certain other parts of Croatia (DZS, 2006). Salary growth resulted in increased consumer demand for higher-quality world brand names, which were not widely available in Croatia at that time. After independence, the Croatian market became flooded with imported goods of variable quality. The habits of younger Croatian consumers, according to a study conducted by GfK Croatia (2005), changed as a result of this increased supply: international brands became the acquisition target of younger consumers, while older people tended to continue to seek out domestic brands. Inevitably, perhaps, purchasing habits also varied geographically.

Financial institutions in Croatia are mostly owned by foreign banks – around 90% according to HNB (2006) – and many of these acquisitions have occurred in the last few years. Although there are a predictable variety of capitalization options for would-be entrepreneurs, a main characteristic of the Croatian domestic market is the bankruptcy of small entrepreneurs as they struggle to collect their own debts. Although barter is a common fixture of the domestic market (between local companies, i.e.), the international ownership of local banks makes such traditional arrangements problematic.

Creating a vibrant business environment in accordance with the standards of the European Union and with countries embedded in the local market economy is one of the major goals of the Croatian government's economic policies. The Government's dedication to the reform of the national economy can be seen in its desire to attract foreign investment for the development of Croatia's domestic and international markets.

Foreign investments in Croatia are regulated by the Company Act and other legal norms. A foreign investor in Croatia has a number of organizational options available to him or her according to this Act: a foreign investor can invest alone or as a joint-venture partner with a Croatian company or private citizen; there are no constraints as to the percentage of foreign ownership that is possible. In addition, in keeping with the Government's desire for foreign investment, investors can gain access to a number of newly opened markets; entrants can take advantage of a number of incentives, tax benefits and customs privileges that are only available to foreign investors.

3.2. The Institutional Environment of Franchising

Since the concept of franchising is relatively new to Croatia and its inhabitants, it is necessary to stimulate and incentives franchising relationships. Presently (2006), there are two Centers for Franchising in Osijek and Zagreb. Each works with the Croatian Franchising Association to stimulate franchising development in several ways:

- Educating about franchising – The Franchise Center in Osijek is organizing seminars, "Franchise A to Z," in order to educate entrepreneurs about franchising and its benefits;

- Franchising promotion – both Centers and the Association are trying to promote franchising as a way of doing business through local media – interviews, articles in the newspapers and magazines, et al.;

- Creating websites with information about franchising on the Internet – information on the portal with current news;

- Connecting supply and demand between franchisors and potential franchisees – one section of the franchise portal contains offers from franchisors interested in the Croatian market; there are several inquiries each week from potential franchisees;

- Helping domestic companies to become franchisors – The Franchise Center in Osijek, with the help of Poduzetna Hrvatska, organized training for potential franchise consultants who can help domestic companies if they decide to use franchising as a growth strategy;

- Establishing franchise fairs and round tables.

Foreign franchises tend to choose one of two potential pathways into the Croatian market: distribution-product franchising and/or business-format franchising. Larger, better-known franchisors like McDonald's open their offices in Croatia and offer franchises to interested entrepreneurs in order to ensure quality control, while smaller and less-well-known franchisors sell master franchises to local entrepreneurs in order to ensure the benefits of local knowledge and cost savings.

During the last few years, The Republic of Croatia has approved a number of laws which resulted in Croatia's acceptance into the World Trade Organization, CEFTA (Central European Free Trade Agreement); these legal changes have also allowed Croatia to begin negotiations for acceptance into the EU. Nevertheless, there is no specific legal basis for franchising in Croatia. Franchising is mentioned in Croatian trade law (Narodne Novine, 2003), where the generalities of potential franchising agreements are stated, but mention is made in only one article and that mention is very condensed. Therefore, there is no legal standard for the development of franchising and no legal parameters (yet) for franchising agreements: at the present time, business practices on the ground determine the appropriateness of such agreements.

3.3. The Current State of Franchising in Croatia

The first franchise appearance in the Croatian market was credit-card franchisor Diners Club International, which entered the market in 1969. "When the former Yugoslavia collapsed, the Zagreb-based office that had been in existence since 1969 signed a franchising agreement with Diners Club which allowed it to operate under license within both the former Yugoslavia and other Balkan countries."[2] For its successful performance in the Eastern European market, Croatian franchisee Diners Club Adriatic won two awards from its Chicago based franchisor.

Franchises became more the norm in Croatia starting in the early 1990s, when the first McDonald's was opened in Zagreb. "McDonald's expansion into the Croatian market has tended to use two franchising methods: direct franchising and business-facility lease arrangements… Such lease arrangements allow for franchisees to become entry-level franchisees using less capital at the outset."[3]

Other franchisors followed McDonald's lead. One of the relatively new franchising concepts in the Croatian market is the Hungarian company Fornetti, which managed to spread quickly its mini-bakeries business throughout Croatia by using franchising. They were founded in

[3] Viducic, Lj., Brcic, G. In Alon, Il; Welsh, D. (2001) International Franchising in Emerging Markets: China, India and Other Asian Countries», CCH Inc., Chicago, p.217.

1997, and today have more than 3000 locations in Central and Eastern Europe (Mandel, 2004). Other international franchises represented in Croatia include Benetton, Subway, Dama Service, and ReMaX.

3.3.1. Data and Trends

Franchising as a business model is still in development in Croatia. In relation to other countries in transition, other emerging markets, Croatia is in the middle of the pack with 126 franchise systems. According to data supplied by the European Franchise Federation, Hungary leads the way with around 300 systems, of which 50% are domestic. Poland trails Hungary with 210 franchise systems (55.7% domestic). Croatia is, as of 2006, ahead of the Czech Republic, which has 90 franchise systems. Trailing Croatia are Bosnia and Herzegovina, Serbia, Montenegro and Macedonia. Slovenia has around 100 franchise systems, although this is a much smaller market. However, the number of franchise systems in Croatia has increased in just the last two years. According to the Croatian Franchise Association, there are approximately 125 (25 of them domestic) franchise systems present in the Croatian market. These systems operate approximately 900 locations and employ almost 16,000 people (Kukec, 2006)

Franchisors in more than 20 industries have chosen franchising as a growth option, with the sales industry and fast-food sectors accounting for more than 20% of the market (Kukec, 2006). Other segments with important shares include the tourist industry, rent-a-car companies, courier services and the fashion industry. The newest franchise systems are being started in a variety of service-sector industries.

Tables 1 and 2 show the most well-known foreign and domestic franchisors in Croatia by industry and number of outlets as of 2007:

Table 1: Foreign franchisors in Croatia

Franchisor	Industry	Number of outlets
McDonald's	Fast food	16 restaurants
Subway	Fast food	6 restaurants
Fornetti	Bakeries	Over 150 locations
Dama service	Refilling toner cartridges	3 locations
Berlitz	Foreign language school	1 location
Firurella	Weight loss center for women	2 locations
Berghoff	Kitchen equipment	3 locations

Source: Round table – Franchising in Croatia EFF/IFA International Symposium, October 24-25, 2006, Brussels

Table 2: Domestic franchisors in Croatia

Franchisor	Industry	Number of outlets
Elektromaterijal	Household appliances' distribution	Over 50 stores
X-nation	Fashion clothes	40 stores / corners
Rubelj Grill	Grill	17 restaurants
Skandal	Fashion clothes	15 stores
Body Creator	Weight loss center for women	4 centers
Bio & Bio	Health food	3 shops
Bike Express	Courier service	1 location
San Francisco Coffee House	Coffee bar	2 locations

Source: Round table – Franchising in Croatia EFF/IFA International Symposium, October 24-25, 2006, Brussels

3.3.2. Barriers to the Development of Franchising in Croatia

During September 2006, The Franchise Center of the Center for Entrepreneurship in Osijek conducted a survey of 50 people, asking what examinees (representatives of banks, entrepreneurs, and lawyers) thought about the barriers facing franchising in the Croatian. Their responses included:

- Laws – there is no legal regulation of franchising in Croatia. The word "franchising" is only mentioned in Trade Law. But, Croatia is not unusual in this respect: only 52 countries in the world mention franchising in any significant way in their legal systems (Zeidman, P.F , 2006). Common or no, however, the absence of clear legal precedent makes it difficult for Croatian lawyers to help their clients, especially during the contracting phase—whether franchisor or franchisee, whether foreign or domestic investor.

- Infrastructure – there is a dearth of infrastructure related to franchising: no banks that will assist franchisors or franchisees, too few educational centers, no franchise consultants who could help potential franchisors in developing their own networks. Banks seem unable to distinguish between start-up entrepreneurs creating footholds in new franchise sectors and franchisees who are entering preexisting, proven franchise systems. There is not enough education about franchising, so even potential franchisors and franchisees do not know where to go to and who to contact if they would like to find more about franchising and how it can work.

- Problems with banks (not familiar with franchising) – banks do not recognize franchising as a relatively safe way of entering into a new business and do not have any specialized loans for the franchising industry. According to a survey conducted by the Franchise Center (2006), some banks' representatives said that they would ask a guarantee for a loan from the franchisor also. Banks are not willing to educate their employees in order to learn about this way of doing business.

- Small market – because there are only 4.5 million inhabitants in Croatia, examinees are pessimistic that the largest franchisors will come to Croatia due to logistical problems: the perception is that it is much easier to open a location in London than in Croatia. Large and famous franchisors are looking on bigger area in sense of population number developing new franchises, and they often resist adapting to local standards and prices. Smaller franchisors that would like enter to Croatia are not as well known to Croatian entrepreneurs and are therefore seldom franchisors of choice.

- Franchising is not a well-known way of doing business – people seldom recognize what franchising is; many think it is connected with insurance. This is the biggest barrier according to the survey because people are not willing to enter into something with which they are unfamiliar. Further seminars and round tables need to be organized in order to educate entrepreneurs about franchising and its potentials and benefits.

Examinees also report that there is an excellent chance for franchising in Croatia, that there is the possibility of high growth in this sector (up to 30%), and that Croatia's membership in the EU will provide the necessary boost to development. This survey showed that although

franchising is not a familiar way of doing business, examinees see a bright future for franchising in Croatia.

According to the above-mentioned survey, there are some identifiable reasons for the relatively slow development of franchising in The Republic of Croatia: entrepreneurial thinking, lack of franchising education, and a weak national franchising association. First, many entrepreneurs would rather own their own companies and have complete "business freedom" than submit to the restrictions they see as related to becoming part of a system – from production and distribution to sales and cleaning of the premises. Second, Croatian entrepreneurs are not completely familiar with the benefits which can be gained by being a member of a successful franchising system.

Both barriers to franchising growth can be overcome by establishing an education system and governmental/financial support for this potentially vibrant business sector.

4. DEVELOPING A FRANCHISING SYSTEM IN CROATIA – THE CASE OF SAN FRANCISCO COFFEE HOUSE

4.1. Background

In the spring 2004, after spending 6 years in the USA, husband-and-wife team Jasmina Pacek and Denis Tenšek returned to Croatia. During their stay in the USA they had gained significant business experience.

Jasmina had worked for several companies: AVL – a company that works with programs for computer design; Northcoast Industries – a fashion store in San Francisco where she started as designer and was promoted to Art Director; and finally Keeco Corporation, which is a leader in house-textile products in the American market. At the same time, Jasmina finished her MFA in Fine Arts and Design at the University of California, where she worked for some time as a teaching assistant. Denis finished his MBA in Business Management at California State University. From 1998 until 2004, he worked in two companies: Tyco Inc. and Brinks Home Security as regional manager. For personal reasons, Jasmina and Denis decided to return to Croatia, to Osijek, where Jasmina's parents were living. Thanks to successful careers and wise investments in real estate in the USA, they returned to Croatia with enough capital to help them in their new start.

After they spent some time in Osijek, they decided to start a new business. While thinking about what they should do, they had noticed that there were many coffee bars in Osijek and that visiting them was part of the life style of the local population. However, all these "bars" offered the same limited product line; they noticed that what was missing in the market was an American-style coffee bar in which most of the offerings would consist of different types of coffee and include the novel (in Croatia) possibility of getting "coffee to go." They decided to adapt this ubiquitous American concept to the local Croatian market. Convinced that the "Made in USA" brand would be positively received in their new market, they named the coffee bar "The San Francisco Coffee House." Jasmina designed a visual identity for their coffee bar, and Denis went about finding proper suppliers of raw materials and finalizing the financial side of the whole project. During the development of the business plan, he traveled

several times to the USA, bringing back suitcases full of coffee mugs, pictures, newspapers, and ideas related to décor.

4.2. Opening of The San Francisco Coffee House in Osijek

They had chosen the location for The San Francisco Coffee House very carefully: They were looking for a location with a minimum of 80 square meters near an area with heavy foot traffic, since their main target market was to be business people. They found an excellent location in the town's center – across from the green market, near three University departments, several lawyers and public notaries' offices – for which they signed a 3-year lease with provisions for extending the lease and a right to pre-emptive purchase in case the owner wanted to sell the premise. After the first few months, they found that their major client markets were students and business people, mainly female in both cases.

The San Francisco Coffee House offers its customers coffee in 17 different latte (with milk) and mocha variants and American-style muffins in several varieties. Coffee can be taken in the pleasant atmosphere of the bar or it can be taken out in "to-go" packaging. In order to adapt to their target market, guests are provided Croatian and foreign newspapers and magazines, have free wireless access to the Internet; the ambience is enhanced by smooth jazz and foreign music from the 70s and 80s.

Today there are 8 employees in SFCH[4], which is managed by Tanja Škaro. The employees are all young people, all without any previous working experience and all of whom have worked in SFCH from its inception. When searching for employees, Jasmina and Denis looked for trustworthy, loyal and honest people. For each workstation, employees have a detailed job description and detailed checklists for each shift and for weekly and monthly routine duties. After employment, all employees passed education for working in bar and their salaries are almost 20% higher those of comparable employees at other local coffee shops.

4.3. SFCH – Creating the Franchise Offer

From the beginning, Jasmina and Denis believed in the success of their idea and in its potential for further growth. Osijek is center of Osijek-Baranja County, which is among the least developed in Croatia[5]. Profitability in this area could be repeated in almost any other location in Croatia. They were sure about this.

Jasmina and Denis talked several times about expanding SFCH by franchising. After they established SFCH, they decided to talk about this idea with consultants from The Franchise Center of The Center for Entrepreneurship in Osijek, which was offering seminars on franchising to entrepreneurs according to the "recipe" bought from the Center for Franchising at The University of Texas, El Paso. Consultants at the Center had a lot of information about franchising and some useful contacts, but they had no practical experience developing franchise networks using existing Croatian companies.

When thinking about the growth of their business, Jasmina and Denis did not want to invest their own money opening other locations in Croatia. Taking advantage of one of franchising's most attractive options, they saw potential in attracting financial investments from

---

[4] SFCH – short from for The San Francisco Coffee House.
[5] Singer et al., (2005), Strategija razvoja Osječko-baranjske županije, page 85

franchisees, dedicating themselves to the "core" business while transferring operational business activities in satellite locations to franchisees.

Developing the SFCH franchise was a project that allowed Jasmina, Denis and The Franchise Center to learn together. Since they did not yet have potential investors and had no anticipated time for return on their own investment in franchise development, they tried to lower the cost of franchise entry as much as possible.

One of the first steps they took was to register and protect the name and logo of SFCH, for which Jasmina – instead of hiring a lawyer who specialized in intellectual property rights protection – studied documents and application papers. She did everything on her own and paid only one-third of the costs a lawyer would have charged.

An SFCH franchise offering resulted from the teamwork of Jasmina, Denis and The Franchise Center. They found key elements for the franchise offer they would craft in different ways: by reading franchise literature, by analyzing the franchise offers of competitive companies, and finally by always returning to the SFCH to assure themselves of reliability of concept. They wanted to build a concept which would be not only attractive to the investors, but which would also ensure them a reasonable return on their investments in the development of the franchise even as resources could be allocated to the further development of the core business, quality improvement of the business model, and increasing brand awareness at the national level.

The SCFH franchise offering was the result of several months of work and research: it was intended for towns with more than 40,000 inhabitants or to tourist areas where the native population was quite a bit lower. Franchisees in towns with fewer than 40,000 inhabitants would have territorial exclusivity; in larger towns this could be negotiated. The location of the coffee bar had to be in a town center, near commercial walking zones, shopping centers or similar high-traffic pedestrian areas. Concerning investment level and location size, four models of SFCH franchises were proposed: *beginner, standard, professional & world class.* The level of initial investment in relation to the franchise model varied from €7,000 to €45,000. Monthly royalties paid to the franchisor would range from €50 to €200, depending on the level of the franchise model and the level-of-use of default suppliers for three major raw materials: coffee, flavorings and packaging for "coffee to go." Franchisees were required to use designated suppliers so that the franchisor could control the quality of the product, though not the operations of the independent franchisee. In order to have good franchise-relationship functionality, the franchisor had to have an interest in the franchisee business, which is in the SFCH case based on the rebate system for raw materials since the franchisor is the only supplier to the franchisees.

The franchise package includes education on three levels: the franchisee, the manager, and the servers in the coffee bar. In addition, the franchisor provides initial marketing support to the franchisee by establishing contacts with local and national media and helping franchisees with opening their stores. The initial franchise contract for SFCH is for 5 years with the possibility of prolonging the contract after that period.

4.4. SFCH - Concept Sales

With a developed franchise offer and clear expectations for potential SFCH franchisees in place, Jasmina and Denis started their search for entrepreneurs who would recognize a good idea and its profit potential. During this search, they were trying to minimize their own expenses, so they decided to use a guerilla-marketing approach even as they availed themselves of The Franchise Center in Osijek and the Entrepreneurial Franchise Center Promaturo in Zagreb. In the event that either of the Centers found a franchisee who would sign a franchise contract, that Center would receive certain percentage of the franchise fee as a finders' fee. Jasmina and Denis realized that they did not really have any other choices for attracting franchisees because of franchising's relative invisibility in Croatia. They realized that it would be necessary to educate potential investors about franchising, that it would not be enough just to offer the SFCH concept to the public.

Jasmina and Denis have received a number of inquiries from entrepreneurs throughout Croatia. They have met with several potential franchisees who were extremely interested in their concept; however, even though these were good candidates, they seldom had the necessary financial resources. While trying to aid their would-be franchisees, the couple discovered that there were no specialized financial products on the market for start-up entrepreneurs who wished to become franchisees. Moreover, they found out that the banks had not yet recognized the lower risks of investment associated with start-up entrepreneurs would wished to become franchisees rather than independent business owners.

In September of 2006, The Franchise Center of the Center for Entrepreneurship in Osijek with financial assistance from USAID project "Poduzetna Hrvatska" and with the help of American consultant for franchise business Ilan Alon, Ph.D., held a seminar on franchising for bank representatives. According to research done on a sample of 7 banks,[6] a majority of banks' representatives were aware that there are no adequate specialized financial products for potential franchisees. Bankers explained this inadequacy by stating that there was not enough demand for this type of financial product and that there was no legal basis which would make franchising a safe investment in Croatia. The absence of adequate avenues for financing franchisees inevitably limited the market of potential SFCH franchisees.

4.5. SFCH – First Franchisee

One of the interested franchise candidates with whom Denis had spoken by telephone came one day by car from the Croatian town of Split, almost 700 km away, in order to see the SFCH operation for him. After a whole day of discussion about the business and the potential development of SFCH, Tomislav Kuzmanić went back to Split and, after a few weeks, invited Jasmina and Denis to visit him and to evaluate several potential locations for an SFCH franchise in Split. Jasmina, Denis and Tanja – the coffee bar manager in Osijek and future coordinator of the franchise network – visited locations in Split which Tomislav proposed; they ultimately chose one for which Tomislav soon signed a 5-year contract as a franchisee. The location is in the old part of Split, near the Diocletian palace; it is even larger than the coffee bar in Osijek.

---

[6] Representatives of following banks attended seminar: Privredna banka Zagreb d.d., Erste & Steiermarkische bank d.d., Zagrebačka banka d.d., NOA – štedno kreditna zadruga, Varaždinska banka d.d., Hrvatska banka za obnovu i razvoj i Slatinska banka d.d..

Signing this first franchisee meant also finalizing the version of a franchise contract for all future SFCH franchises. Jasmina and Denis had only completed a draft version of the contract, which they had planned to adapt to the specifics of the situation once they located their first franchisee. Since there are no lawyers who specialize in franchising contracts in Osijek and only a very few, all with very limited experience, in Croatia as a whole, they decided to hire Margareta Krivić, a young lawyer and Denis's former schoolmate. From the start, Margareta showed great interest, effort and willingness to learn with them as she investigated this new area of the law. Jasmina and Denis thought that Margareta's dedication and determination would more than compensate for her inexperience, especially given the paucity of legal precedent related to franchising in Croatia. Too well aware of the disordered legal system in Croatia when it came to the franchising and to functional problems in the legal system in general, Denis, Jasmina and Margareta devoted a great deal of time on this first franchise contract so that all parties would have their interests protected.

At the same time, while they were finalizing arrangements with the franchisee from Split, Jasmina and Denis used the offices of The Franchise Center in Osijek to get in contact with several young entrepreneurs from Zagreb. They were interested in opening an SFCH franchise in Zagreb, and they were currently looking for a suitable location for what would be the second SFCH franchise. According to Denis's and Jasmina's estimation, Zagreb could profitably accommodate several SFCH franchises based on the number of its inhabitants.

5. CONCLUSION

Franchising is one of several possible models for business growth and is widely used in economically developed countries throughout the world. Some of the reasons why companies prefer to develop franchise networks rather than creating subsidiaries include lower financial investment, lower risk, faster growth, and local market knowledge by franchisee; and the franchisee's motivation to succeed.

There are few franchisors in Croatia in relation to its neighboring countries although franchising's possibilities are quite numerous. The barriers which the San Francisco Coffee House faced during its development of a franchise network highlight the major challenges which face Croatian companies as they seek to establish their own networks. In sum:

- There is just not enough information about franchising. As a result, entrepreneurial and institutional awareness of franchising is quite low;

- There are no well-established support organizations for the development of franchise networks in Croatia. There are only two Entrepreneurship Centers in Croatia which offer services regarding franchise network development;

- There is no legal regulation of franchising. At the present time, there are no standards for franchising contracts, and there are not enough lawyers familiar with franchising;

- There is no significant support from financial institutions. Banks fail to recognize the relatively lower risk of investment in start-up entrepreneurs/franchisees than in independent start-up entrepreneurs.

At this time, companies in Croatia that decide to develop their own franchise networks should be aware of additional challenges they will face during that developmental process.

The present research is preliminary and exploratory. It is based on an analysis of one exemplary case that underlines several significant issues, but this should be followed by research on larger samples using a quantitative rather than a qualitative approach.

1. ALBANIAN ENTERPRISE MANAGEMENT, PROBLEMS AND PROSPECT

1.1. Introduction[1]

What is management about? There are a lot of books, studies and papers really preoccupied to give the answer. But, I would like to refer to a very interesting book written by PRIOURET, R[2]. in French (1968) "*Une fois défini l'environnement et l'état de guerre économique, alors, mais alors seulement, on peut essayer de préciser ce qu'est le management. Il est tout simplement la mise sous tension rationnnnelle de l'ensemble des elements qui composent une enterprise. Il se procede donc comme un ensemble de règles élémentaires qui procèdent du simple bon sens…Le management est action réfléchie. Sa demarche est dialectique. Il oscille perpétuelle entre deux contraires, donc il faut faire la synthèse difficile, entre deux dangers opposes dans lesquels il faut éviter de tomber*".

The management concept is now more familial for the countries via transition - integration to EU. But if this concept continues to be more important in the global framework, on the South Eastern Europe (SEE) countries it needs to overcome a lot of barriers and to face different challenges. In this context, the paper has focused on the truth tensions of enterprise management in South Eastern Europe (SEE), particularly in Albania. If the management is considered important like the division of labour (TAYLOR), the management "know-how" is the best key to win in the "economics' war". Besides the general progress of the economic trends in SEE, is not very sufficient to support sustainable growth and environmental challenges. In fact, the progress of institutional reform and the business environment indicate that contemporary management needs more attention. On the other hand, management culture and business ethics depends strongly on the society and its evolution.

In general, the Albanian economy like other SEE countries entered currently as part of an ongoing macroeconomic growth. But, the Albanian business environment continues to be difficult, complex and is often characterized by inconsistent application of law and regulations. There are evident the lack of technology, experience, organization and structural

---

[2] PRIOURET, R.; "La France et le Management", DENOËL, Hommes et Thechniques, Paris, 1968.

problem inside of enterprise, problems with the bad loan and the weakness axes of credit, the role of entrepreneurship and its management culture, etc.

Through this paper our aim is to analyze two directions:

- First, specifics of Albanian enterprise management: target, barriers and prospect to respect economic ethic.
- Second, some aspects of the Albanian managerial education (graduate and postgraduate degree): the case of Agricultural University of Tirana (AUT).

1.2. A short view of Albania's macroeconomic situation

After almost half a century of an extremely centralized government and the economic collapse, Albania started on a path of market economy in 1992. The economic regime before 1991 consisted of the most extreme model of centralization and governmental autarky, followed by a weak and inefficient economy. Since 1992, a significant progress has made way during this transition. The results are related to the application of macro and micro reforms whose aim is to apply market. The development of the Albanian economy continues to be in line with the objectives of the strategy for the economic development of the country. The Albanian economy grew by 6.0 per cent in real terms. In fact, since the decline of the communist regime in 1990 the Albanian economy has noted significant changes, which have resulted by the application of the structural reforms. Trade has been liberalized. The privatization of small and medium enterprises has been completed and only a few enterprises in the sectors of heavy industry, mines, metallurgy and the services sector remain yet to be privatized. The private sector's share of GDP has been risen from 5 percent in 1990 to about 75 percent in 2002. The change of ownership from state to the private sector is expected to result in better management and productivity of enterprises. One of the most important changes was the beginning of privatisation of state properties and the passage of owning rights in favour of individuals, etc. In spite of that, almost the majority are privatised and some progress is noted in structural reforms and large-scale enterprise privatisation. But the progress towards establishing a functioning market economy and sound legal frameworks has been hampered by continuous internal instability and corruption[3].

Despite the significant changes of the privatisation way, many problems remain very important for Albanian economic growth. They are related to different factors, particularly:

- **Social and economic conditions**

The socio-economic development experience in Albania during the years of transition (shifting from the communist regime to market economy) has noted significant changes in general. But, despite some improvements in the economic performance Albania remains one of the poorest countries in Europe with GDP per capita at around 2000 USD. There is a lot of inequality in the national distribution of incomes[4], and many social and economic problems.

---

[3] A severe socio-economic crisis in 1997which led to the collapse of the institutional order was a serious setback to the reform process. Un other dramatic situation was related with the Kosovo crisis in 1998-1999.
[4] Albania is involved in the framework of the Poverty Reduction and Growth Strategy with the assistance of the World Bank and IMF in fall 2001.

- **The trend of economy growth and the change of economic structure**

According to the statistics data the Albanian economy entered the year 2006 as part of an ongoing macroeconomic consolidation process. It is estimated to have grown by 6 percent in real terms with a controlled inflation around 3 percent. Albania has diverted from industry to services. Within the industry, construction has had the highest growth, while weight of agriculture has been reduced considerably because of several factors, including land reforms and migration. The economic growth during these years has had a considerable support from remittances from migration and a number of difficulties to identify sources from informal and international activities.
Figure 1.   *The structure of Albanian GDP in years, according the source of Macroeconomic Department, Ministry of Finance, 2005, Tirana.*

The quick growth of the Albanian economy during the last years has been supported by the agriculture, industry and construction sectors, where the value added was increased more quickly than the general average. But the structure of the Albanian economy is characterized by a strong polarization between the traditional sectors such as agriculture and services sector. Although the increase by 1.4 % in structure during 2004, industry continues to be less developed (its weight reached 10%). Services represent the biggest sector of the Albanian economy and during the years 2003-2004 its weight reached in 53.7% of the Value Added. Agriculture has given a solid declining contribution in the economic growth (out of 1.9% in 1998 to 0.5% in 2002, with a 1.4% jumping in 2004). The most dynamic activities (transport, communication and other services, mainly the financial ones) in the services sector have provided a stabilized support to the economic growth.

Table 1 The main economic indicator during the period 1999 - 2005

	1999	2000	2001	2002	2003	2004	2005
Real growth of GDP (in %)	8.9	7.7	6.5	4.7	6.0	6.0	5.5
GDP (in current prices, in millions of USD)	3548	3694	4102	4497	5702	7581	8379
GDP per Capita (in USD)	1052	1086	1329	1460	1833	2434	2550
Number of employed (in thousands)	1081	1068	1065	921	928	917	931
Unemployment rate (in %)	18.0	16.9	14.6	15.8	15.0	14.6	14.2
Inflation rate in percentage (y/y)	- 1.0	4.2	3.5	1.7	3.3	2.2	2.0
Budget deficit (with grants, as a % of GDP)	- 12.1	-8.2	-7.9	-6.6	-4.9	-4.9	-3.8
Public debt (as a % of GDP)	69.7	71.3	66.8	65.1	60.7	55.3	54.9
External debt (as a % of GDP)	- 32.3	29.4	25.8	23.4	20.7	17.8	16.8

Source : Institute of Statistics, Ministry of Finance, IFM estimates and Bank of Albania

- **Incomplete structural reforms and institutional weakness**

There are a lot of difficulties to continue the strategic privatisation. If almost of small and medium enterprise are privatised like the agro industry sector, the process is with a lot of failures for the strategic enterprise (the case of Albtelecom, Savings Bank, etc.). Also, the right to property is legally guaranteed but remains ill defined due, inter–alias, to incomplete land registration. This leads to frequent disputes and constitutes a serious impediment to the creation of the function property market-including a land market-which, in turn, discourages investment and holds back the development of agriculture.

- **Strong handicap heritages by the communist regime**

Poor physical infrastructure, including transportation, communication, power and water shortages with the consequences on business and economic development are inherited by the communist past. This point is the most significant thing that needs to be overcome in order to have better management for the new enterprises and the evaluation of work.

- **Underdeveloped financial instruments**

During the transition process significant changes in the financial and banking system have been made. The new bank is creating and credit to domestic economy has recognized adequate development. Only for the period 2001-2002, the new credits extended reache to lek 103,2 billion. This means that the annual average lending for the recent two years is five times more than in the period of 1993 – 2000. Besides, the expansion of micro credit schemes and non-bank institutions is another useful development with the concrete issues for economic growth. Micro credit schemes have a priority to rural areas and to small businesses.

The number of new bank is biggest and the credit to enterprise[5] continues to growth, particularly in agro industry sector. But, the Albania's banking sector continues to be the least developed in the region. A "*culture of banking*" does not currently exist and many citizens keep saving under their mattresses rather than in banks. Moreover, the Tirana Stock Exchange is only formal and non functional, except for the circulation of treasury bills. The Albanian enterprise are not yet prepared to be listing and to use this important place for their needs of financial capital.

---

[5] According to Bank of Albania statistics, the ratio of private sector lending to GDP is only 7,2 % which is similar to lending in Romania but much less than in other nearby countries.

Table 2 Albania intermediation indicators over year

Indicators[6]	1994	1995	1996	1997	1998	1999	2000	2001	2002
Time deposit/GDP	17.0	21.4	15.3	25.9	29.4	32.7	33.2	36.4	40.1
Domestic credit/GDP	13.4	17.7	26.0	27.5	28.2	30.4	30.6	32.5	35.1
Credits to the private sectors /GDP	3.8	3.7	3.9	3.8	3.2	3.6	4.5	5.9	7.2
Credits to the private sectors/Time deposits	22.5	17.2	25.3	14.6	11.0	11.0	13.6	16.1	17.5

Source: Bank of Albania, Annual Report 2002, Tirana, 2003.

- **High level of shadow economy and corruption**

According to Schneider's (2002) estimation method, the size of Albania's informal sector is comparable to those in Lithuania (30,3 %), Croatia (33, 4%), Bosnia and Herzegovina (34,1 %), Romania (34,4 %), and Bulgaria (36,9 %). From official and non-official sources it is estimated that around one-third of total economic activities in recent years are informal. The large evasion fiscal has also demonstrated it.

Reform of tax collection, which contributed to an increase in tax revenues, has progressed significantly, but the fiscal deficit remains high. According to EBRD, 2002, the average bribe tax as a percentage of annual firm revenues in Albania is increasing from 1,7% in 1999 to 3,3 % in 2002 ranging the country in the top list of 26 transition countries, unfortunately! "Pervasive smuggling, underreporting on invoice, falsification of balance sheets" (Olters, 2003) continue to be very critical problems on one hand for the public budget, on the other hand for the development enterprise. The combination of low revenue collection, average tax rates and high "tax bribes" are the significant factors of the large shadow economy in Albania. Consequently, this is a negative indicator to discourage the development of private enterprise.

- **Low level of foreign investments**

Albania is regarded as a country with low barriers to foreign capital and direct investment. But in fact, the Foreign Direct Investment (FDI) in Albania continues to be low in comparison with the countries in Balkan region. These are some reasons about limited FDI investment: insecure investment environment, technological factors and poor infrastructure, heavy administration procedures and the corruption in the public administration.

- **The regional and international context**

Since 1999 Albania has been following the strategies of the Stability Pact to help boost trade, support private sector economy and attract foreign investors. Albania's accession to the WTO in 2000 as well as the signing of bilateral trade agreements with 60 countries shows that following this structure is being provided successful. Looking ahead to next year, Albania is sure to see the signing of the Stabilization and Association Agreement with the EU.

From the geographical viewpoint, the European Union remains the main destination of Albanian products, occupying 88 percent of total exports. Sales in European markets have recorded an annual growth of Euro 30 million or 7 percent against the previous year. However, this market has lost terrain in favor of market extension to the region countries.

---

[6] Note: "*Time deposits*" include time deposits in domestic currency and foreign currency deposits.

Exports with region countries of the South-eastern Europe, with which Albania trades under free trade agreements, have increased by 19 percent compared to the previous year, extending the Albanian export market in this area from 8.5 to 9.2 percent of total exports. Kosovo and Macedonia represent the largest markets for exporting Albanian products.

Albanian economy development has also reflected the impact of international factor influence, particularly the impact of changes in regional area and more. Despite the very low competitive skills, Albania has played an important and constructive role towards regional stability and co-operation, including through active participation in the Stability Pact for SEE. The stabilization of Albania's budding market economy, and more specifically the successful implementation of reforms in investment and trade policies, is the result of following Stability Pact measures and the main target to realize the economic and commercial integration with EU. On June 13, 2006, Albania signed the Stabilization and Association Agreement (SAA) with EU.

Albania is focusing on increasing their local production levels. Currently the major industrial exports are textiles and footwear, asphalt, metals and metallic ores and crude oil. There are also the opportunities in the agribusiness sector (agriculture provides more than half of the GDP). If at the beginning of the transition process many specialized workers left the country, now more Albanians are returning home to invest in their native country. Most are putting their money into the tourism and construction sectors, etc.

Table 3 Albanian Export - Import during the period 2003 - 2005

Export:	Share on total export			Import:	Share on total import

1.3   Management Enterprise, Entrepreneurship Development and SME Support

The transition from centralized economy to free market economy created the space for the setting up and development of enterprise in Albania in different mode from the past of the socialist enterprise. In contrast with many central and Eastern European countries, which

---

[7] South Eastern European countries
[8] South Eastern European countries

inherited a considerable development of the small private sector before transition period, there did not exist any form of this sector in Albania, and moreover it was prohibited by law. By consequence, the country began market economic reforms from an extremely centralized economic system. As elsewhere in Eastern Europe, a significant decline in production characterized the initial phase of transition. The development of enterprise respecting market rules in Albania is considered like an important axe of the national economy. The dynamic private sector, especially the SMEs, both those that have been established since the fundamental political changes and those that are the results of the privatization process, have been considered by the Albanian Government as a priority of the transition reforms since 1992.

The transition process started with a sensitive increase in the number of small enterprises by the end of 1992 and beginning of 1993, when many trading, transport, construction and agribusiness enterprises were transformed into private property. The significant changes of enterprise's sector were interrupted by two crises, respectively by the pyramid schemes in 1997 and Kosovo's crises in 1999. During those crises the activities of a lot of new enterprises were closed with a negative effect on GDP growth. On the other hand, in compliance with the Law, which allowed the private activity, the Albanian entrepreneurs started private activities first as temporary employees and later as self-employed. The development of entrepreneurship was followed by the employment of other family members or relatives. As business activities became larger, many of them dropped the links with the state and dedicated themselves to the private activity. Business growth brought about the need to employ personnel from outside the family. Albanian government has pursued a large number of reforms in order to encourage further business activity. These reforms cover corporate law, transparency, SMEs development and privatization issues.

The support for the enterprise management continue to be a central key for economic reform in Albania.

According to the ***Structural Survey of the Enterprises*** realized by INSTAT some specifics for Albanian enterprise development are the following (see also the table):

- The enterprises with 10 and more employed dominate the Albanian economy. Enterprises with 10 and more employed were most dominating in Industry, Construction and in Transport & Communication. More than 90 percent of the total enterprises were enterprises with 1-4 employed but their turnover reach only to 24.3 percent of the total turnover. The small enterprises are dominant in Service Producers.

- 63.7 percent of the turnover came from Service Producers, while Industry has 40 percent of the employed.

- 48 percent of the total investments were in Industry. Only during 2004, 54.2 milliard leks were invested. 31 percent of the investments were in construction and 35 percent in installations, machineries and technical equipments.

- The enterprises with 5 or more employed in Construction and Trade have increased 43 percent their turnover from 2003 to 2004. All the main indicators show increase from 2003 to 2004. The number of enterprises has increased 2661, especially in enterprises with 1-4 employed and the number of employed increased with 9660. The turnover is also increased. Investments increased from 2003 to 2004 with 2.6 billion leks. The

investment per 1000 leks of turnover varied from 114 leks for 2002, 113 leks for 2003 to 102 leks for 2004.

- The rate of creation of new enterprises differs with years. In 1996 it was characterized by rate of 26 percent. After the period of 1996 and on, it is a more stabile process with an average rate of almost 19 percent in the creation of new enterprises. The assessment of data regarding the number of registered enterprises and the presently active ones, suggests that the level of enterprises that cease to exist is approximately 63 percent.
Figure 2: registered and active enterprises

Source: INSTAT, Tirana, 2005.

- Another characteristic of enterprises is their concentration on geographical areas. Considering the migration of population (according to the results of the census in 2001), we notice that 44% of the population and 60% of the economic enterprises have been concentrated in 9 districts of Albania. The prefectures, which indicate the greatest number of closed enterprises are: Tirana, Vlora and Fier. In the structure of enterprises according to the economic activity, the majority of enterprises carry out the trade and service activity and those sectors represent about 73 percent of registered enterprises. This structure was almost similar for each year.

Table 4 Some indices for the Albanian enterprises (According the size groups of employers)

Number of enterprises	Total	1 - 4	5 - 9	10 - 19	20 - 49	50 +
Year 2001	35,521	32,616	1,697	617	297	294
Year 2002	36,248	33,163	1,775	585	373	352
Year 2003	36,005	32,761	1,856	651	426	311
Year 2004	38,667	35,006	1,860	906	559	336
Net profit/loss (million leke)						
Year 2001	29,739	16,103	4,149	2,646	1,876	4,965
Year 2002	33,952	17,092	2,920	2,404	2,476	9,060
Year 2003	44,953	16,627	4,733	2,364	2,777	18,452
Year 2004	58,263	16,965	3,928	3,951	4,663	28,756
Value added (million leke)						
Year 2001	81,043	23,013	8,402	5,816	6,293	37,519
Year 2002	97,910	24,264	6,959	5,917	9,439	51,331
Year 2003	121,783	24,956	9,122	6,845	10,672	70,188
Year 2004	139,650	26,231	8,091	9,744	15,192	80,392

Source: INSTAT, Tirana, 2005.

Also, the active enterprises that are under VAT during 2005 are 8779. Compared with 2001 this number is increased 16.9 percent and compared with 2004 the increase is 2.9 percent. The

sales for all economic sectors have been increased about 62 percent compared with 2001 and 16 percent compared 2004. We notice that the sales index in 2005 had a considerable increase compared with 2001 in the Trade, Hotels and Restaurants sector with about 72 percent, in the Industry sector about 51 percent, in the Construction sector about 63 percent, and in the Transport & Telecommunication sector about 47 percent. But according to businesses themselves, the economic activity in recent year (2005) is contemplated to have undergone a more sensitive deterioration. Such phenomena are a logical consequence of the electricity crisis our country was faced with during that period.

Table 5 Basic data for all Albanian market producers, 2001 - 2004

1.4   Ethic Management: the challenges to face in the future

The "Six Pillars of Character" developed by The Josephson Institute of Ethics include: "*Trustworthiness: honesty, integrity, promise-keeping, loyalty; Respect: autonomy, privacy, dignity, courtesy, tolerance, acceptance; Responsibility: accountability, pursuit of excellence above; Caring: compassion, consideration, giving, sharing, kindness, loving; Justice and fairness: procedural fairness, impartiality, consistency, equity, equality, due process; Civic virtue and citizenship: law abiding, community service, protection of environment*".

If we can face the above pillars with the reality of ethic management of enterprise via transition process isn't easy.

First, we cannot analyse the ethic management particularly if we don't take in consideration enterprise management in general. What problems we notice during the transition process for an efficiently management enterprise? Let's note some more important arguments that we notice in the Albanian case:

- The impact of interior change of enterprise (see the schema below);

Enterprise interior changes		
Identification of market	**Determination of objectives**	**Identification of structure costs**
• Demand level	• Property structure	• Raw material
• Product type	• Relationship with the market	• Labor
• Quality characteristics	• Employer number	• Energy
• Price	• Confidence	• Package
• Adjustment manner	• Relationship with the financial and bank system • Long term strategy of development	• Others

- The endogenous product factors (technology, political economy of regulation, trade policy, etc.);
- The effect of production variables like value added, sales, employment, capital, costs of raw materials.
- The market share as well as significant factor of efficiency enterprise (weakness with the marketing component);
- The privatisation process;
- The domination of SMEs;
- The degree of the use of the financial tools in management process**.** One of the real problems for enterprise efficiency in different sectors is to include better knowledge of the management and administration. Where to find the capital? In what way are the investments financed? Continue to be really preoccupant questions.
- The lack of culture management about insider and outsider ownership;
- The corporate governance statutes were vague
- An incomplete framework law about the enterprise and its linkage with the others actors inside and outside

- The weakness of banking and financial system to support the transforming enterprise and the growth;
- The creation of new enterprise. In addition to the privatisation process, in the Albanian case, this process is stimulated also by the emigration[9]. Although most emigrants worked illegally and had part – time, low-skilled jobs, the majority found the overall experience positive and the skills and earnings they acquired abroad have contributed to establishing businesses upon their return[10].
- The relationship with the public administration;
- The degree of integration vertical is very low or inexistent;
- The collaboration with the foreign and the situation of export - import.

The lack of business ethics and the correspondent problems have been influenced by a lot of factor in Albania as follows: enterprises are in general very small and very diversified; attention for the client is very low; lack of business culture in the Albanian mentality; lack of honest competitiveness. Economic development of Albania towards free market economy brought in increase of production competition as well as unfair competition. One of its form is the falsifying of domestically produced products that have a good name in the market. This phenomenon is more accentuated in food industry. On the other hand we notice that the entrepreneurship things more for the maximum profit that for the client, the level of formation is low. There are difficulties in managing environmental issues tempts for many enterprises to under manage and neglect necessary pollution control and environmental protection. There are also enterprises that do not take care of the environment like a serious risk. The level of informal economy and corruption is high. Consequently, the level of social responsibility; employment conditions and insurance professionals are in lot of case problematic. Also we can notice a lack of responsibility in business regulation (not respect of legal accountability).

Some opportunities and handicaps for the ethic management application in Albania

Opportunities	Handicaps
- New regulatory reform for business environment	- Weak role of the institutions
- Privat sector development	- Weak local administration
- Enterprise spirit	- Marginal financial ressources
- More conformity of the environment for the business	- Weak culture
- Continuation of the trade liberalization	- Mentality
- Existence of Taks Force	- High informal production
- Improvement of linkage with financial system bank	- High level of corruption
- Professional training and HRM	- Level of education
- Transparency	- Quality management, control and audit
- Collaboration with the foreign investment	- Customs procedures
	- Tax administration
	- Land and construction permits
	- Sector licensing

---

[9] According the rapport IFM, July, 2003, "*emigration of Albanian nationals since 1990 of some 500 – 600000 leaving the country amount to a considerable demographic upset. This corresponds to more than 15 % of the population as a whole and more that 40 % of the population aged 19 – 40 years. Still some20 – 40000 Albanians per year leave even if this is on the decrease. Italy and Greece remain the top destinations for Albanian emigration. Italy is hosting between 100 and 150000 emigrants whereas Greece some 350 – 400000 emigrants.*

[10] Kula Dh. ,Mançellari A., Pappanagos H., Qirici S. and Sanfey P. in their research *The causes and consequences of Albanian emigration during transition – evidence from micro data,* 2000, had emphasis that majority owners believe that an emigrant has a better chance to establish a business than a non –emigrant does.

The new managers take more attention about ethical problems. A very interesting and unique case still now is the example of 2K Group, Albanian company that has on line the below ethic code:

Ethic code for 2K Group sh.p.k
We need to pay attention on interest conflict and we must move the conflict and manage it in order to shift the loss;
Not profit without permit; NO bribe!
We must use the firm's asset only with authorization;
No distribution of confidential information;
Equal opportunities inside the company for everybody;
Honest competition
We must take care for environment impact and secure technical rules for every business decision;
The most important asset is the staff;
All employer must respect;
We should always help each others;
No insider trading !

A review of ethic management principles suggests that SEE's enterprises need to take care of this argument more. In this frame a great attention should be paid to: the improvement of economic, institutional and legal framework environment for enterprise support; enforcement of management culture; training program enterprises to understand the basis of ethic management. The use of tools such as Public-Private Partnerships can be really valuable. In bringing the public and private sector together only the management skills of the business community will create better value-for-money for taxpayers and lead to more sustainable state finances.

The ethic management must be an important criterion to improve the climate for business, investment and employment; to attract and encourage private investment; to ensure private sector involvement in the reform process and to realize the implementation of policy reform.

In conclusion, we would like to keep in mind two current characteristics of enterprise management in Albania that need the respect of ethic management imperatively: from a majority commercial business during the transition process, currently we can notice the shift to productive business. Step by step, we can notice more cases in which the propriety is divided from the management. We can conclude also the imperative to overcome some handicaps in order to improve the conditions of effiency enterprise as well as a special challenge for economic growth and the progress in the future.

2. ROLE OF MANAGEMENT EDUCATION IN AUT

2.1. Place of managerial courses on curricula of AUT

The Agricultural University of Tirana (AUT) is one of the best representants of the Albanian public universities on education and research. During a 55 years experience, AUT is an academic and research unique center really important that continue to contribue for the graduation and postgraduation, training and extension in the area of Albanian agriculture. It is also the first university center. They are about 7000 students and 250 academic staff, also 250 administrative and supporting staff.
AUT has three faculties: Faculty of Agriculture with 10 departments issuing 10 diplomas, Faculty of Forestry Sciences with 2 departments issuing 2 diplomas and Faculty of Veterinary Medicine with 3 departments issuing 3 diplomas.

Since the beginning of the transition process the important restructuring curricula have been applicated. Soon after the Bologna Declaration, AUT started again its restructuring according to the new rules. But, the new reality of agrarian situation, its obstacles and opportunities and on the other hand the high education reform, have conditioned the demand to adopt more carefully the combination of managerial skills with the specialization of the students. This fact is argued by the position of management matter on different diplomas. The place of management mater is argued also by the challenges of concurrence and the needs of market economy. We can illustrate a significant example: the growth of student's number that have studied on agrarian business management.

At AUT there are operational also postgraduate schools. They have been established in compliance with Law on Higher Education in the Republic of Albania and Regulation of MES. At AUT there are operational different postgraduate schools (see the schema below). The managent matters take also an important ration.

Figure 3:Ppost graduate studies

The relation between AUT and enterprises is considered also a strong bridge to consolidate the management skills that students have learned at university.

Another component is the National Center for Professional Training in Agriculture. This is a new component of the organizational structure of AUT. This center supports the needs of the employees for professional formation and training in the area of agriculture, forestry, food and environment.

The creation from the AUT students themselves of the team of Student on the Free Enterprise (SIFE) from 2000 and their serious participation on the national and international competition is also a demonstrative argument for the appreciation of management concept and the entrepreneurship. The project developed by the AUT students are very different and interesting as like as the project for "Cheese technology", "Wine cords", "Goats dairy products", "Medical plants", "1 hand, three forest", etc.

2.2. Some result of the project "L'intention entrepreneuriale des étudiants Albanais".

Last spring (2006) the students of AUT were involved on the project "*L'ntention entrepreneuriale*" organized by Centre d'Etudes et de Recherches Apliquees à La Gestion, CNRS UMR 5820, Grenoble, Maison de l'Entrepreneuriat, Grenoble Universites; Centre National de la Recherche Scientifique, France.

The main target of the project was the study of behavior of European students in front of the entrepreneurship. There are participating 299 Albanian students from AUT. This study has involved male (51%) and femele (49 %). Average age is 23.2 years ans (Min : 20, Max : 40). The principals results are:

- 39 % of the students are from scientific field and 61% students from social field.

- The result of the sensitivity toward company creation is remarcable. There's no significant difference between the professional vision and the entrepreneurship spirit of the participant students. The belief of the student is concentred on the majority answer "Very realisable". There is a high level of entrepreneurship target.

- Descriptive analysing has demostred that 93.3 % of students think that the idea to create the business at the end of their studies is attractive, only 4.7 % of the student are neutral and 2 % don't know.

- As far as the question "*Do you think you would be able to start your own business?*", is concerned, the results have indicated that 70.1 % of the Albanians evaluate their capacities to start a business, 9.2% of students are found "incapable" and 20.7% of them are undetermined.

- 77.2% of students have indicated that have the capacities to create an enterprise. The sex indicates a role: (test of Khi2 to10%), the females are more evaluated. But, the environment has also its inluence: 73.3% of the stutents that have a parent "entrepreneurship" have the sensivity that are capable for the business.

- The model of "l'intention entrepreneuriale" is measured by the alternative "employed/entrepreneurship". The question was: "*If you where to choose between running your own business and being employed by someone, what would you prefer* ?" The degree of "l'intention entrepreneuriale"for Albanian students is very important: 68.4 % of the students would like to create an enterprise at the end of their studies. On the other hand, 18.7% would like to be employed and 12.9% are undetermined.

3. CONCLUSIONS

In conclusion, the paper indicates some suggestions, which are important to be taken in to consideration to improve business ethics and to provide feedback to enterprise on expected growth. The study of Albanian enterprise development indicates that the reform impact has created a new panorama in general. This is related by the significant institutional changes and the great support from different international projects like World Bank, PNUD, etc.

The orientation to implant the management tools continues to be really important. On the other hand, a great attention should be paid to the improvement of economic, institutional and legal framework environment for enterprise support; enforcement of management culture; training program enterprises to understand the basis of ethic management.

Some problems like the legal aspect, accounting practices and its standards, inventory control, production' cost, marketing, quality control, personnel management and strategies for the future must considered more serious. Besides, respect of sustainable management demands more responsibility of entrepreneurship. If the implementation of macroeconomic stabilization policies and deeper structural reforms are associated with a lot of measures to improve business environment, a particular attention needs to demonstrate improvement of the ethic management in all SEE countries and particularly in Albania.

Key words: *Leadership style, Leaders' personal characteristics,*
Employees, Organizational features

1. INTRODUCTION

Leadership style is a crucial element of leadership. The importance of leadership style results from its role in organization's success. Many authors agree that there is a great correlation between leadership style and company's performance (Gebert and Steinkamp, 1991; McDonough and Barczak, 1991; Dawson et al., 1972; Swanson and Johnson, 1975). Because of this, it is important to analyze the leadership style in Croatian companies.

In the empirical research of leadership styles in Croatian companies, Likert's classification of leadership style is applied. This classification is widely used in the literature, and it satisfies the purpose of this research. This means that the leadership style is observed as job-based or employee-based, and it is identified by six leadership variables: leadership, motivation, communication, decision making, objectives, and control.

The aim of this research is to identify the dominant leadership style in Croatian companies, as well as to determinate the correlation between leaders' personal characteristics; organizational features and leadership style.

2. THEORETICAL BACKGROUND OF LEADERSHIP STYLES

There is no topic more important to business success today than leadership. Leadership is used to motivate employees to adopt new behaviours and, for some strategies, to infuse new values and attitudes (Daft and Marcic, 2001, p. 168). In the basis it is the ability to influence people towards the attainment of goals. It could be the important factor of success or failure of company. Bennis and Nanus (1985) stated that a business short on capital can borrow money, and one with a poor location can move. But a business short on leadership has little chance form survival.

Leadership is dynamic and involves the use of power. Power is the potential ability to influence the behaviour of others. It represents the range of resources with which a leader can effect changes in employee behaviour. One of the major differences between the leader and

the manger relates to their source of power. Management power comes from organizational structure and leadership power comes from personal sources, such as personal interests, goals, and values (Daft and Marcic, 2001, p. 385). The use of the power is connected to the determination of different leadership styles.

Leadership style represents an important aspect of leadership. Many authors agree that the leadership style has significant influence on job satisfaction and organizational commitment, company performance, productivity and profitability (Darwish, 1998, p. 275-284).

So it is very important to determinate the appropriate leadership style, and in order to achieve this it is crucial to definite the factors which have some impact on dominant leadership style. Many authors argue that the leadership style is influenced by leaders' characteristics, employees' personal characteristics and organizational features (Tannenbaum and Schmidt 1958; Yukl 1994; Maheshwari 1980).

There are many leadership style classifications in the literature. In this paper the adaptation of Likert's classification is applied because it is widely used and it satisfies the purpose of this research. Likert was the first who stress the importance of different leadership styles for performance and work efficiency, and who has, based on his empirical research, reached the conclusion that all leadership styles are the cause and not the consequence of work efficiency (Skansi, 2000, p. 54).

According to Likert (1961), optimal performance can only be achieved if attention is paid to the human aspects of subordinates' problems and behavioural aspects, such as motivating forces, communication processes, interaction-influence processes, decision making processes, goal setting processes, control processes, and performance characteristics. Based on these considerations, leadership styles could be either job based or employee based, and then further classified as follows:

Job based:
- Exploitive-authoritative type of leadership (System 1). This system utilizes an autocratic, top-down approach to leadership. Employee evaluation is based on punishment and occasionally on rewards. Downward communication is predominant and there is little lateral interaction or teamwork. Both control and decision making reside at the level of the organisation. This system is manipulative and results in low productivity.
- Benevolent-authoritative style of leadership (System 2). This system is similar to System 1 but management tends to be more paternalistic. Employees are given a little more freedom than in System 1. Management defines the limited boundaries for interaction, communication and decision making. This system produces average results.

Employee based:
- A consultative leadership style (System 3). Employees have more interaction, communication and decision making than in System 2. Although employees are consulted about problems and decisions, management makes the final decision. Overall productivity is good.
- A participative group style (System 4). This system makes extensive use of employer participation, involvement and groups. The groups are highly involved in setting goals, making decisions, improving methods and appraising results. Communication

occurs both laterally and vertically. It maximizes the quantity and quality of performance.

3. RESEARCH HYPOTHESIS AND METHODOLOGY

3.1. Research hypothesis

The main goal of this research is to find out the dominant leadership style in Croatian companies, on the basis of Likert's concept of leadership styles, as well as to find out the existence of the correlation between organizational features; leaders' personal characteristics and leadership style.

To this purpose, the following hypotheses are defined:

H1:   In Croatian companies the dominant leadership style is consultative leadership style.

H2:   There are no major differences in leadership style regarding different companies' activities.

H3:   The dominant leadership style depends on company size in such a manner that in smaller companies the leadership style is more oriented towards System 3 (Consultative leadership style).

H4:   The dominant leadership style depends on the leaders' gender.

3.2. Methodology

Subjects for this research were 389 individuals (managers) working in 118 different Croatian companies.

The demographics of the respondents in the sample are captured by several characteristics.

Women account for about 43 percent of the respondents. There are also 43 percent married survey participants.

The age distribution of the sample is as follows: interviewed persons younger than 40 years represent 52 percent of the sample; 41 percent are persons between 40 and 55 years, and 7 percent are individuals older than 55 years.

Just over 87 percent of all interviewed managers are university educated, and some 12 percent of them have high school degree. By profession, over 90 percent of the total number of interviewed are engineers and economists.

In terms of work experience, some 30 percent of all interviewed individuals reported working less than 10 years; and just over 8 percent reported working more than 30 years. There is a nearly even split between individuals who reported working between 11 and 15 years which represent 15,7 percent of respondents, individuals who reported working between 16 and 20

years which are 15,2 percent, and individuals who stated working between 21 and 25 years which represent 17,0 of interviewed persons.

Table 1 represents the structure of interviewed companies by activity.

Table 1. Numbers of companies in the sample

Activity	Number	%
Commerce	35	29,66
Manufacture	28	23,73
Services	55	46,61
Total	**118**	**100,00**

The data collection is conducted by questionnaire with 76 questions. The questions were classified in four groups. The first group of questions is related to the characteristics of the company, such as activity, size, age and region of belongings, the second group of questions concerns the personal characteristics of interviewed individuals such as age, gender, marital status, experience and tenure. The third group of questions relates to the leadership style which was covered by 6 variables: leadership, motivation, communication, decision making, objectives and control. And finally, the fourth group of questions is about organizational culture.

From the questionnaire structure it could be seen that this was a huge research, so the leadership style analysis presented in this paper is just one part of this research. As it is already stated the leadership style is analyzed by 6 individual leadership style variables. In the questionnaire these variables are covered as follows.

Every variable was examined by two to four questions. The answers to these questions have four levels of intensity.

In the case of variable leadership the respondents were asked about trust in subordinates, felling of free by subordinates in communication with leader and use of subordinated' ideas by the leader. The variable of motivation is analyzed by the questions about ways of motivation pursued by leaders, responsibility of achieving objectives and the level of team work development. The communication is detected by cognition about usual direction of information flow, the level of information acceptance by the employee, accuracy of information from the employees and understanding of employees' problems by the manager. The knowledge about decision making is obtained by the questions about the level where the decisions are making, employees' participation in decision making process and motivation by goals. The variable objectives is examined by manner of objective determination and the existence of resistance towards designated objectives. And finally, the last leadership style variable the control is studied by the questions about the determination of the persons responsible for control, the existence of resistance to rules and purpose of control data.

Data analysis and testing the hypotheses are conducted by appropriate statistical methods. For leadership style analysis methods of arithmetic average and standard deviation were used. Additionally, Spearman's rank correlation coefficient is used to analyze the correlation between some relevant variables. Statistical analysis was based on computer programs SPSS 11.5 for Windows and Microsoft Excel 2000.

4. RESEARCH RESULTS

The primary goal of this research was to determinate the dominant leadership style in Croatian companies. In order to achieve that goal leadership style was analysed according to Likert's model by 6 leadership style variables. In table 2 there is the leadership style determination by those variables.

Table 2. Leadership style determination

Leadership style variables	Style
1. Trust in subordinates	2.47
2. Feeling of free by subordinates in communication with leader	3.23
3. Use of subordinates' ideas by the leader	2.77
Leadership:	*2.82*
1. Type of motives	2.73
2. Responsibility for meeting objectives	2.89
3. Team work	3.18
Motivation:	*2.93*
1. Usual direction of information flow	2.73
2. Acceptance of information by the employees	3.21
3. Accuracy of information from the employees	3.01
4. Understanding of employees' problems by the manager	2.91
Communication:	*2.97*
1. Level of decision - making	2.18
2. Subordinates participation in decision -making	2.96
3. Motivation of employees	3.31
Decision - making:	*2.82*
1. Manner of objectives' determination	2.74
2. Existence of resistance toward designated objectives	3.18
Objectives:	*2.96*
1. Persons responsible for control	3.00
2. Existence of resistance to rules	2.97
3. Primary purpose of control data	3.27
Control:	*3.08*
Leadership:	**2.95**

It could be noticed that all variables have the values on the border between 2 and 3 which means that the dominant leadership style among Croatian managers is some transitional form from benevolent-authoritative style to consultative leadership style. But it should be pointed out that it is much closer to the consultative leadership style (the sum of all variables is 2.95).

If we want to analyse the influence of each leadership variable on dominant leadership style it could be perceived that leadership and decision making indicate that management develops benevolent-authoritative style (e.g., the level leadership - 2.82; and the level of decision making - 2.82). On the other hand, the level of variable which represent control is 3.08 which means that consultative leadership style is also present. As it was already stated the sum of all variables is 2.95 so it could be concluded that dominant leadership style in Croatian companies is oriented towards consultative one.

Figure 1 present the illustration of dominant leadership style in Croatian companies.

Organizational variables	System 1	System 2	System 3	System 4
How much trust do you show toward your subordinates?	Practically none	Some	Quite a lot	A lot
How free do the employees feel in discussing business matters with you?	Not at all	To a certain extent	Quite free	Very free
How often do you effectively use your subordinates' ideas/suggestions?	Rarely	Sometimes	Often	Very often
What do you use to ensure the required performance: (1) fear, (2) threats, (3) punishment, (4) rewards, (5) participation?	1, 2, 3, sometimes 4	4, some 3	4, some 3 and 5	5, 4 - based on objectives agreed with all the employees
Who is actually responsible for meeting the designated objectives of your enterprise?	Only the general manager	Enterprise management	None specific	All the employees
How much is teamwork used in your enterprise?	In a very small extent	In a relatively small extent	Moderately	Extensively
What is the usual flow of information?	Upside-down	Mostly upside-down	Both upside-down and bottom-up	Upside-down
How do the employees accept the information from the higher levels of hierarchy?	With suspicion	Sometimes with suspicion	Cautiously	With "open mind"
How accurate is the information communicated to management by the employees?	Usually inaccurate	Often inaccurate	Often accurate	Almost always accurate
How well do you understand the problems faced by your subordinates?	Not so well	Well	Quite well	Very well
What is the principal hierarchical level on which the decisions are being made?	Mostly on the top of the hierarchy	Mostly on the top of the hierarchy, with some delegation	Fundamental policies on the top, with a lot of delegation	On all hierarchical levels, but all the decisions are well integrated
Are your subordinates involved in decision-making?	Almost never	They are sometimes consulted	They are often consulted	They are completely involved
How much does the involvement in decision-making contribute to the motivation of employees?	Not to a large extent	Only to a small extent	Only to a limited extent	To a large extent
How do you determine the enterprise objectives?	By giving orders	By giving orders, but accepting the comments	Both orders and discussions	Group actions (except in a crisis)
How much do the employees resist toward the designated objectives?	Significant resistance	Limited resistance	Occasional resistance	Small or no resistance
Who controls operations and business results?	Only general manager	General manager to a significant extent	All managers	All managers and employees
Are there any individuals/groups resisting the agreed rules and procedures?	Often	There are some	Sometimes	No
What is the primary purpose in which the control data (describing costs, productivity, etc.) are being used?	Mostly for managing operations/enterprise	To determine rewards and punishments	To determine rewards and facilitate self-direction of employees	Mostly to faciliate problem solving and self-direction of employees

Figure 1.   Profile of leadership styles in Croatian companies

In further text the leadership styles are analysed on the basis of some personal characteristics of the interviewed managers or organizational features of companies in which they work.

Table 3 represents leadership style determination and ownership status of interviewed persons.

Table 3: Leadership style variables and ownership status of interviewed persons

Leadership variables	Owner	Employee	Owner and employee	Total
Leadership	2.92	3.02	2.95	2.97
Motivation	2.96	2.94	3.29	3.06
Communication	2.93	2.96	3.06	2.98
Decision making	3.16	2.80	2.88	2.94
Objectives	3.18	2.94	2.62	2.91
Control	3.37	3.08	2.66	3.04
Total:	**3.09**	**2.96**	**2.91**	**2.98**

From table 3 it could be noticed that there are no major differences between leadership style and ownership status. No matter is the interviewed person owner, employee, or both, the dominant leadership style is oriented to consultative style but slightly emphasised in companies where the interviewed person is owner. In these companies the control variable is on the highest level (3.37) which implies the existence of the consultative leadership style. In contrary, the variable objectives has the level of 2.62 in companies where the interviewed person is at the same time owner and employee, which implies the existence of the benevolent-authoritative leadership style.

Table 4 shows the connection between leadership style and jobs performed by interviewed persons.

Table 4: Leadership style variables and jobs of interviewed persons

Leadership style variables	General manager	General manager assistant	Technical manager	Production manager	Commercial manager	Account and finance manager	Human resources managers	Other	Total
Leadership	2.95	2.66	2.78	2.97	3.09	3.03	2.81	3.04	2.92
Motivation	2.71	2.55	2.71	2.70	3.27	2.89	2.94	2.94	2.84
Communication	2.99	2.87	3.14	2.89	3.14	3.02	2.67	2.93	2.95
Decision making	2.38	2.50	2.94	2.58	3.01	2.79	2.43	2.83	2.68
Objectives	3.14	3.03	3.07	2.69	3.16	2.90	2.79	3.57	3.04
Control	3.09	2.92	3.23	2.71	3.12	3.06	2.97	3.08	3.02
Total:	**2.88**	**2.75**	**2.98**	**2.75**	**3.13**	**2.95**	**2.76**	**3.07**	**2.91**

The table above shows the slightly differences in leadership style regarding the organizational position of interviewed persons. The consultative leadership style is evident in position of commercial manager; the technical manager is also oriented towards this style, as well as account and finance management, while general managers, general manager assistant, production management, and human resource management are slightly inclined towards the benevolent-authoritative leadership style.

Dominant leadership style regarding the gender of interviewed persons is the style between benevolent-authoritative and consultative leadership style, with the strong orientation towards consultative style. This could be observed from table 5. But it is also needed to point out that consultative leadership style is emphasised in the case of men.

Table 5. Leadership style variables and gender of interviewed persons

Leadership style variables	Male	Female	Total
Leadership	3.02	3.01	3.02
Motivation	2.92	2.95	2.94
Communication	2.96	2.98	2.97
Decision making	2.84	2.56	2.70
Objectives	2.97	2.95	2.96
Control	3.08	3.09	3.09
Total:	**2.97**	**2.92**	**2.94**

Table 6 and 7 represent relation between leadership style variables and organizational features.

Table 6. Leadership style variables by companies' activities

Leadership style variables	Commerce	Manufacture	Service	Total
Leadership	2.95	2.95	3.07	2.87
Motivation	2.83	2.90	3.07	2.93
Communication	3.03	3.00	2.83	2.95
Decision making	2.72	3.00	2.98	2.90
Objectives	2.99	2.96	3.00	2.99
Control	3.21	2.95	3.12	3.09
Total:	**2.95**	**2.90**	**3.01**	**2.95**

There are some but no major differences between leadership styles regarding companies' activities. No matter is the company's activity is commerce, manufacture, or service the dominant leadership style is oriented on consultative one.

Table 7. Leadership style variables and the companies' size

Leadership style variables	-100 employees	101-250 employees	251- employees	Total
Leadership	3.05	2.90	3.03	2.99
Motivation	3.05	2.76	2.78	2.86
Communication	3.12	2.94	2.86	2.97
Decision making	2.97	2.59	2.77	2.78
Objectives	3.16	2.75	2.80	2.90
Control	3.21	3.08	2.99	3.09
Total:	**3.09**	**2.97**	**2.88**	**2.93**

As can be seen from table 7, in totality there are but small differences between leadership styles related to the size of small firms. In all three cases the consultative style of leadership is emphasized, especially in companies which employ less than 100 people. Some differences exist in individual variables. Control function is the most developed variable in companies with less than 100 people (3.21), as well as in companies which employ from 101 to 250

individuals (3.08). On the other hand, decision making variable is the least developed variable in all sized companies.

Global independence between leadership style variables and personal characteristics of leaders in surveyed companies in Croatia is analyzed by Spearman's rank correlation coefficient. Correlation coefficients between individual variables of leadership style and leaders' personal characteristics are given in table 8.

Table 8. Correlation coefficients between leadership variables and leaders' personal characteristics

		Ownership status	Position	Gender	Age	Origin of l leaders	Education	Tenure
Leadership	r p N							
Motivation	r p N				-.139** .003 389			-.100* .025 389
Communication	r p N					.134** .004 389		
Decision making	r p N					.102* .022 389		
Objectives	r p N							
Control	r p N	-.107* .017 389					-.200** .000 389	

  * The correlation is significant at the level of 0.05, i.e. 5%
  ** The correlation is significant at the level of 0.01, i.e. 1%

From the table 8 it could be seen that the correlation has been found between just some leadership variables and some leaders' personal characteristics. The intensity of discovered correlation is very week. Individual variables leadership and objectives do not have any correlation with any leaders' personal characteristics.

A significant correlation has been found between motivation as leadership variable and age and tenure of respondents. This correlation is the negative one, and has week intensity. The correlation between communication and origin of leaders also exists. It is positive correlation and its intensity is also week.

The positive correlation of week intensity has been found between decision making and origin of leaders.

And finally, the leadership variable of control has the negative correlation with ownership status and education. This correlation also has week intensity.

Table 9 represents correlation coefficients between individual variables of leadership style and organizational features.

Table 9. Correlation coefficients between leadership style variables and organizational features

		Activity	Size
Leadership	r		
	p		
	N		
Motivation	r	.148**	-.088*
	p	.002	.041
	N	389	389
Communication	r		
	p		
	N		
Decision making	r	.207**	-.153**
	p	.000	.001
	N	389	389
Objectives	r	.092*	
	p	.036	
	N	389	
Control	r	.112*	
	p	.014	
	N	389	

 * The correlation is significant at the level of 0.05, i.e. 5%
 ** The correlation is significant at the level of 0.01, i.e. 1%

In this research the influence of two organizational features on leadership style is observed. These features are activity and company's size.

There is a significant positive correlation between activity and motivation, decision making, objectives and control as leadership style individual variables. In all cases the perceived correlation is of week intensity. On the other hand, there is no correlation between company's activity and variables of leadership and communication.

If the case of variable company's size the correlation with leadership variables is detected only in the case of motivation and decision making. In both cases the observed correlation is negative and low intensity. In the cases of leadership, communication, objectives and control significant correlation is not perceived.

5. CONCLUSIONS

This paper has been devoted to identify the dominant leadership style in Croatian companies. Additionally, it investigates the influence of organizational features and leader's personal characteristics on leadership style in surveyed companies. The leadership style is analyzed by

six individual variables which allow the observation of the influence of each single variable on dominant leadership style.

The empirical results show that the sum of all leadership variables is 2.95 which indicate that the dominant leadership style in Croatian companies is on the border between benevolent-authoritative style and consultative leadership style. But it could be stated that the orientation of Croatian managers is on consultative leadership style. This confirms the hypotheses 1 of this research.

If each single leadership style variable is analysed it could be noticed that the leadership and decision making suggest the management orientation towards benevolent-authoritative style. Contrary, the variable control indicates the existence of consultative leadership style.

The hypothesis 2 supposes that there are no considerable differences in leadership style regarding different companies' activities. This is confirmed by research results presented in the table 6. Therefore, it could be concluded that company's activity does not have a large influence on dominant leadership style. In all observed companies no matter on theirs activities the dominant leadership style is oriented on consultative one. In order to fulfill this observation, Spearman's correlation coefficient shows the significant positive correlation but week intensity between company's activity and some individual leadership variables, which confirms some but no major differences between leadership styles regarding companies' activities.

The hypothesis 3 suggests that leadership style depends on company's size in such a manner that in smaller companies the leadership style is more oriented towards consultative leadership style and as companies grows the authoritative elements become evident. On the basis of research results presented in the table 7 it could be stated that in smaller companies the dominant leadership style is consultative one, and as companies grows the leadership style is more oriented toward benevolent-authoritative style. So in the large companies the management tends to be more paternalistic, it defines the limited boundaries for interaction, communication and decision making. The correlation coefficient relating to company's size implies the existence of significant but low intensity negative correlation between company's size and just two leadership style variable which are motivation and decision making.

Research results show that the dominant leadership style regarding the gender of interviewed leaders is oriented toward consultative style. But some slight differences do exist. The greater orientation toward consultative style is evident in the case of male managers. In the case of gender the significant correlation between gender and individual leadership variables do not exists.

The contribution of this paper relates in the fact that it increases the knowledge about leadership style in Croatian companies, and also it represents the basis for further researches on this topic. This study discovers the dominant leadership style in Croatian companies and correlation of leadership variables with some leader's characteristics and organizational features. But there are many other relations, aspects and causes which could be investigated in order to accomplish the complete picture about all elements which influence on leadership style.

1. INTRODUCTION

At the beginning of this research, we were interested in the other half of the educational equation, employers' point of view. It is something of a cliché´ for businesses to note the importance of their ''human resource'', i.e. their people. But, what is expected from this resource? What skills are required, particularly from graduates beginning their carrier? This article explores some of these questions and reports on the action that is being taken in marketing area to support business requirements.

The aim of this paper was to gain a greater understanding of the skills expected from a graduate, if there were any perceived differences in the employers' viewpoint between business and nonbusiness graduates and to what extent, if any, the discipline affected rate of promotion.

Furthermore, changes in accreditation standards and procedures are demanding attention to measuring and improving the effectiveness of graduate education (Pharr and Morris, 1997). Funding bodies, including state legislatures, are requesting evidence that education expenditures are producing meaningful results. Even more dramatically, the rankings of MBA programs by media such as *Business Week* and *U.S. News* and *World Report* have increased the felt need to demonstrate the effectiveness and responsiveness of graduate training to the demands of the market. Finally, some customers (including students, parents and employers)

have expressed dissatisfaction with perceived skill sets and made requests for additional types of training (Jacobson 1993; Floyd and Gordon 1998; Hatfield and Taylor 1998).

It is the fact, that as a direct consequence of educational expansion, the number of graduates searching for employment has grown dramatically (Hayman and Lorman, 2004). Therefore, those graduates are main competitors at the job market and probably their core competence will be the rating of the school they graduated at. Kandola (1999), reflects on the "manager-graduate relationship" suggesting that greater level of performance can be achieved with the development of individual's attributes and skills. Nevertheless, schools have to start offering graduate programs which are demanded by the market.

Through this research, authors wanted to better understand the marketing skill sets and marketing knowledge which our own graduate marketing students should have upon degree completion.

2. EXPECTATIONS FROM GRADUATE STUDENTS

The emphasis on skills required by employers varies depending on the type of a job to be carried out within an organization. However there has been some consensus on the importance of "transferable" or "employable" employees' skills, particularly for those in management positions. These skills refer to certain personal abilities of an individual, which can be taken from one job role to another, used within any profession and at any stage of their career (Raybould and Sheedy, 2005).

Employers have the opinion that too much emphasis is placed on theory and that certain practical skills are omitted. Problem solving, financial perspectives, leadership and communication skills are all areas highlighted as being deficient. There is, therefore, an inherent need to include a greater level of practical skills in teaching in order to satisfy this employers' need.
For many years the demise of the graduate recruitment scheme has been predicted, some suggesting that dynamic employers want graduates that can take substantial responsibility and contribute to bottom line profitability within months of joining an organization (Hayman and Lorman, 2004). Contrary to this view, some "blue chip" (organization that if invested in, would be considered to be very reliable and safe and among the strongest performers in its sector) employers have retained their "scheme", believing that hand picked recruits developed in(to) the organizational "mould" are more likely to achieve the medium- to long-term results so desperately sought.

Consequently, more young people are able to enter at graduate level a wider variety of occupations than ever before, the highly "vocational" nature of "new" university courses revitalizing the concept of education to meet employer's needs. The rapid growth of graduate disciplines and number of graduates has changed the balance of graduates and non-graduates in the workforce. Scott-Clarke and Byrne (1995a, b) noted that this increase has resulted in the gradual change of jobs previously taken by non-graduates. Because organizations need to select those recruits that are most likely to deliver the performance most consistent with the organization's needs, some organizations have developed dedicated recruitment procedures that carefully select, recruit, train and develop such employees.

Research on graduate employment addresses generic competencies as skills, abilities and attributes that complement the field of specialization of employees for work performance (Day, 1988; Sandberg, 1991; Lam, 1994; Cheah and Yu, 1996; Sohal, 1997; Percetakan National Malaysia Berhad, 2001; Mitchell, 2003). In other words, employers prefer workers who have generic competencies like interpersonal skills, leadership skills, teamwork, and oral and written skills for work performance. In addition, cognitive skills like numerical skills, innovative skills, problem-solving skills, research skills and computer skills are also reported to denote generic competencies for work performance (Quek, 2005).

Furthermore, it is reported that attributes like diligence, dependability (Percetakan National Malaysia Berhad, 1996; Quek, 2000; Percetakan National Malaysia Berhad, 2001) and honesty, and attributes associated with flexibility, like adaptability and resourcefulness (Schroder, 1989; Appelbaum et al., 1999; Percetakan National Malaysia Berhad, 2001), are generic competencies for meeting workplace needs. Accordingly, Jacobsen (1993) described generic competencies as success skills in employees that are needed to transfer learning from the classroom to the workplace for fulfilling work demands.

At the Malaysian Confederation of Scientific and Technological Association's (COSTAM) 10th Public Lecture in July 2000, the Minister of Education also voiced clearly that students who had not learned generic competencies were unable to apply what was learned in the classroom to the workplace. In other words, graduates who were not taught explicitly generic competencies, i.e. skills, abilities and attributes (to complement their areas of specialization), were unable to cope and survive in the world of work, and these graduates faced difficulties in getting employment (Lee et al., 2001; Singh, 2001; Quek, 2003). This is because employers prefer to employ graduates who have generic competencies like numerical, evaluation, problem solving, and innovation skills for operating as knowledgeable staff to satisfy the demands of complex working situations. In addition, graduates who are flexible and can adapt quickly to meet current and specific workplace needs so as to enable the corporation to stay ahead of competitors in design, production and marketing are also sought by employers (Singh, 2001; Quek, 2004).

Overall, based on their experience of business graduates, employers commented on the lack of practical skills being taught and the overemphasis on theory (O'Brien and Deans, 1995). Marketing education literature states that an ever-increasing emphasis is placed on transferable skills, e.g. presentation techniques, financial analysis and computer literacy (O'Brien and Deans, 1995). This may also satisfy employer expectations to a greater degree, since employers are constantly stressing the importance of graduates having skills in various areas. According to Graduate Prospects, the trading subsidiary of the charity HECSU, "Nearly two-thirds (64 per cent) of vacancies on offer are open to graduates from any discipline. This reflects the fact that employers are looking for vital soft skills in graduates which are obtained during study and periods of work experience, rather than degree-specific knowledge" (Raybould and Sheedy, 2005).

3. GRADUATE LABOR MARKET

The graduate labor market worldwide has undergone significant change in the last decade (Purcell et al., 2002; HESA, 2000; Pearson et al., 1999). Many more new graduates are available to recruiters and their composition is more diverse. In the main, to date, this

expansion in graduate supply has been accommodated by the labor market, albeit with some lags in demand in times of recession (Holden and Harte, 2004). There have also been notable changes in the distribution of jobs within the graduate labor market. For example, the Association of Graduate Careers Advisory Services report vacancies from information technology (IT), sales and marketing companies increasing significantly in the late 1990s. Vacancy levels for small to medium-sized enterprises (SMEs) have also been increasing (Holden et al., 2003). Indeed, the traditional route of new graduates into employment, focused predominantly on the large employer, through an annual intake of young graduates to a dedicated entry route, appears to be in terminal decline.

However, the weight of labor market evidence suggests that this is more than counter-balanced by non-traditional opportunities; for example, professional and managerial work outside traditional recruitment channels (Purcell et al., 2002; Pearson et al., 1999). To explore and assist in understanding the changes across the whole graduate labor market, Elias and Purcell (2003) propose a new fivefold classification of the occupational structure. In addition to "traditional" graduate jobs (for example, in the medical and legal professions) and "modern" graduate jobs (banking, accountancy, IT) the authors identify the "new" graduate jobs (for example, technical services, marketing, sales) and niche areas of graduate employment, such as hotel management, nursing, sports and entertainment. Elsewhere, numerous studies have sought to identify the missing skills in new graduates or identify their supposed strengths and weaknesses as they enter first destination employment (e.g. Pettifor and Higgins, 2003; Rajan et al., 1998; Graduate Employment and Training, 1997; AGR, 1995).

The employers' survey (O'Brien and Deans, 1995) highlighted some areas of interest when considered in the light of student expectations. Students appear to be studying under the misapprehension that they will leave university and go straight into a senior management post. Employers find them unprepared for such posts and, regardless of their degree subject, provide further training. This training reflected the lack of presentation, analytical, oral and computer literacy skills which graduates displayed. Stewart and Knowles, for example, report employers indicating that it is only after a graduate has been in the labor market for some time that they become more "realistic" about their expectations.

It was proven then for some graduates, the transition from higher education to work is often far from smooth. Increasingly we can see evidence (Galloway, 2000; Jones et al., 2001; Harvey, 2001; O'Reilly et al., 1999; CVCP, 1998) of a view of graduate employability which holds that a degree is not the end of learning. Indeed, Harvey (2001) argues that a critical purpose of higher education is not so much the delivery of employability skills in some generic sense but the development of "critical lifelong learners". This, he maintains, enables students to go beyond the narrow confines of their "safe" knowledge base of their academic discipline to applying themselves to whatever they encounter in the post-education world. Evetts (1998), for example, argues that "lifelong learning is the motivated and planned activity of the individual (engineer) to ensure his/her own professional development".

However, there is also a responsibility of employers who are demanding the certain skills from graduates. In a market economy, employers are often reluctant to invest in employee development due to perceived uncertainty about the return on this investment of time and money.

4. MARKETING GRADUATES

To date, literature in the area of graduate education has focused primarily on general business education, with marketing being one element of this. Middleton and Long (1990) reported that this may be due to the fact that "employers do not differentiate between marketing and management skills". Previous research studies have therefore tended to be in the more general area of business education opposed to focusing exclusively on marketing elements.

Therefore, in their research Ellen and Pilling (2002) analyzed employers perception towards MBA and marketing oriented MS. Without naming them as MBA and MS, respectively, 71% of employers felt the broad-based degree (MBA) would better suit their organization. Further in the questionnaire, the broad-based degree was identified as the MBA, and the specialized degree as the MS. In response to the question, "assuming you have two applicants with equal qualifications, in your company, would you be more likely to hire a person with an MBA or an MS," 43% answered it would make no difference, 40% favored the MBA, and 17% marked the MS. Those more likely to hire MBAs expected the applicant to be a generalist, capable of understanding all areas (not just marketing), with multi-functional capabilities more fitted for corporate office level. They also expected others to be more knowledgeable about and therefore more comfortable with the result of MBA training. Preference for the MS degree, as expected, emphasized the in-depth knowledge and ability to be a "real" marketer. Subsequently they were asked about whether these same individuals could be offered similar or different salaries. Eighty-nine percent indicated that there would be no salary differences between the MBA an MS, and eight percent said the MS degreed person would receive a lower salary for the MS, while 32% felt the MBAs would have better opportunities for career advancement.

Our research examines the desired marketing skills set and marketing knowledge which employers are seeking when they hire graduate marketing students. The employer perspective is logical starting point for several reasons. First, the likelihood of suitable employment for the graduate student will increase if that student is perceived to possess the skills set valued by prospective employers. Second, based on socialization theory, the likelihood of career advancement should also increase when there is a greater match between the student's skills set and what the employer is seeking (Dubinsky, Howell, Ingram and Bellenger, 1986). Third, we would anticipate a long-term positive perception of a given school's program in marketing as its graduates demonstrate that they have acquired the skills necessary to be effective. This positive perception would be indicated by an improved reputation with employers, an increased demand for that school's graduates, improved employment rates, higher salary levels, and better career advancement.

Do we teach the courses necessary to enquire specific skills? Within a given course, are the appropriate skills related to the topic area being taught (as identified in the employers' survey)? For example, in a marketing research class, do the students develop the ability to design and execute a market research study? Can students demonstrate these skills in the interview process and on the job? It may be necessary to revise the graduate marketing curriculum to better deliver desired marketing skill sets. This process, particularly in terms of bureaucratic demands, may be facilitated by the "market-driven" data.

5. METHODOLOGY

For the purpose of this study the same methodology was used as in Ellen and Pilling (2002). Therefore, this research also addresses two main issues:

1. What do relevant constituents believe are the appropriate outcomes for the educational process at a graduate marketing program? What should students be able to do? What skills should they have?

2. What criteria are deemed to best prepare a student for positions requiring graduate marketing training? The criteria examined include undergraduate preparation, degree specialization, and course-specific training.

To address the first question about skill sets, employers were asked to delineate core marketing skills necessary for effectiveness in their companies. For the second question, they were asked what type of training (i.e., undergraduate degree, degree of marketing specialization and topic-area training) would provide the best training for their work.

5.1. Sample

The questionnaire, first developed by Ellen and Pilling (2002) was distributed among 100 top companies in Bosnia and Herzegovina which are most likely to hire a graduate students. Survey was done in October 2005 via post, and answers were requested the same way. After a second call, total of 38 filled questionnaires returned. Even though it seams as a rather small response rate, if we consider the overall economy and business environment in Bosnia and Herzegovina, we can take those data as relevant. Unfortunately, very few companies have developed continuous education formula for their employees, and they plan and evaluate human resources, so they are competent to answer our questionnaire. Those are the same companies which cooperate with School of Economics and Business, and participate in creation of undergraduate and graduate programs. Since we had received their questionnaires, we proceeded with analysis.

Among researched companies, number of employees varied between 6 and 7.561, and their distribution is clearly shown in table 1.

Table 1: Number of employees

Number of employees	Frequency	Percent
1 – 19	1	2.6
20 – 99	10	26.3
100 – 499	18	47.4
500 +	9	23.7
Total	**38**	**100.0**

Out of the total number of employees, working in marketing department there are between 1 and 419 employees, and this detailed distribution is given in table 2.

Table 2: Number of employees in Marketing department

Employees	Frequency	Percent
0-5	14	36,8
6-25	9	23,7
26-100	10	26,3
100+	3	7,9
Total	36	94,7
System Error	2	5,3
Total	**38**	**100,0**

Furthermore, questionnaires were filled by Marketing Manager in 44.7% of the companies, or at some places by CEO with 21.1%. Respondents mostly hold an undergraduate degree (84.2%), while 15.8% of the respondents have graduate degree.

5.2. Analysis

The survey asked employers for the three most important core skills that would be expected form a person with a graduate degree in marketing that would **not** be expected from a person with a graduate degree in another business area. By limiting the respondents to only three core skills, we hoped to get them to prioritize their needs rather than provide whole listings of marketing activities or tasks. The results, as shown in table 3, indicate that management capabilities are by far, at two leading positions. Total of 55.6% of respondents mentioned Marketing Management among three most preferable competencies, while 52,8% indicated overall general management capabilities. Those results are consistent with the fact that 52.6% of the managers stated that they would expect marketing graduate to have broad marketing knowledge rather then specialized.

Table 3: Core skills

Category label	Count	% of the Responses	% of the Cases
Marketing Management	20	18,9	55,6
General management capabilities	19	17,9	52,8
Creativity	16	15,1	44,4
Communications	10	9,4	27,8
Research capabilities	7	6,6	19,4
Public Relations	5	4,7	13,9
Calculations	4	3,8	11,1
Marketing plan development	4	3,8	11,1
Market analysis in BH and region	3	2,8	8,3
Foreign Language Proficiency	3	2,8	8,3
Media contacts	2	1,9	5,6
IT literacy	2	1,9	5,6
Service Marketing	2	1,9	5,6
Macroeconomic knowledge	2	1,9	5,6
Technology knowledge	2	1,9	5,6
Team work	1	0,9	2,8
Insurance Industry	1	0,9	2,8
Management of transferable system	1	0,9	2,8
Kindness	1	0,9	2,8
Human Resource Management	1	0,9	2,8
Total	**106**	**100,0**	**294,40**

Given that a company wants someone with graduate training in marketing, does the undergraduate preparation matter? Undergraduate training was expected to be relevant for two reasons. First, the MBA degree has shifted form its original positioning, as a business degree for students without an undergraduate business degree, to a second business degree. Employers might prefer someone with greater business training, as indicated by two business degrees, or they might prefer someone with other complementary or industry related skills, such as technical training. Responses to this question are given in the following table.

Table 4: Undergraduate degree

Undergraduate degree	Frequency	Percent
Economics or Business	33	86,8
Engineering	3	7,9
Social or human science	1	2,6
Other	1	2,6
Total	**38**	**100,0**

As we can see, two business degrees, both undergraduate and graduate are preferable in the majority of responses (86,8).

Some universities, including University of Sarajevo, have two graduate degrees – the traditional MBA (Master of Business Administration) in Marketing and the Master of Science (MS), which is traditionally more specialized. Since MBA is world wide known, at first two programs were described to respondents, but not particularly named as MBA or MS. This approach allowed the respondents to choose a degree based on its concept rather than preconceived notions about the degrees. Specifically, employers were told that students had two options for their degree: students could take courses across all business areas and then take up to 1/3 courses in marketing (broad-based MBA) or students could take few courses in other business areas and up to 2/3 marketing courses (specialized MS). From these descriptions, employers were asked which program better prepared students for their department. The question forced them to choose between the two options, and responses are shown in table 5.

Table 5: Preferences towards specialized or broad program

Study program	Frequency	Percent
1/3 courses in marketing	10	26,3
2/3 courses in marketing	28	73,7
Total	**38**	**100,0**

From the given results, it is clear that specialized MS is greatly preferred then broad based MBA. Open-ended questions were also included to understand the reason for this preference. Surprisingly, reached results are inconsistent with the previous question. Managers stated that they prefer specialized program, while in the next table 31.3% of them indicated broad theoretical knowledge as a reason for preference.

Table 6: Reason for preferences of the program

Reason for preference	MBA	MS	Neither	Row Total
Broad theoretical knowledge	5	3	2	10 (31,3%)
Experience	4	3	2	9 (28,1%)
Narrow specialization	0	7	0	7 (21,9%)
Business Management	5	0	1	6 (18,8%)
Consumer Behavior	3	0	0	3 (9,4%)
Specifics of the business	1	1	1	3 (9,4%)
Understanding the interactions with other departments	2	0	0	2 (6,3%)
IT and Communications	1	0	0	1 (3,1%)
Data gathering	1	0	0	1 (3,1%)
E-business	1	0	0	1 (3,1%)
Marketing plan development	1	0	0	1 (3,1%)
European education system	1	0	0	1 (3,1%)
Roll of the Marketing function	0	1	0	1 (3,1%)
Column Total	16 (50,0%)	14 (43,8%)	2 (6,3%)	32 (100%)

Then the programs were named with the broad-based approach corresponding to the MBA program and the specialized approach corresponding to the MS program. The respondents were asked, assuming two applicants were equal on all other qualification except their degree specialization, which would they hire, and whether there would be differences in salary or opportunity for advancement. These questions also allowed employers to indicate no preference for one program over another and the results are listed in tables that follow.

Table 7: Preferences between MBA and MS

Program	Frequency	Percent
MBA	20	52,6
MS	15	39,5
No preferences	3	7,9
Total	**38**	**100,0**

Interesting is that when programs are named, 52,6% choose well known brand MBA, while previously, without naming, this program was preferred only by 26,2% of the respondents. This can be greatly used by the university in order to promote MBA. It is obvious that MBA brand is widely known and acknowledged as better graduate program then MS. There is no major differences in salary for two groups of gradates, but MBAs are more likely to be promoted then MSs.

Table 8: Influence of the program on salary

Salary and the program	Frequency	Percent
Higher salary for MBAs	9	23,7
Higher salary for MSs	8	21,1
Same salary for MBA and MS	21	55,3
Total	**38**	**100,0**

Table 9: Influence of the program on promotion

Promotion and the program	Frequency	Percent
Promotion for MBAs	16	42,1
Promotion for MSs	9	23,7
Same promotions for MBA and MS	13	34,2
Total	**38**	**100,0**

Finally, feedback was sought on the value of training in specific topics, corresponding to the fourteen graduate marketing courses offered by Marketing department at University of Sarajevo. Respondents were asked to indicate up to five courses that would be most beneficial to someone working in their department. They could also add topic areas if no existing course corresponded to their top five needs. Reached results are shown in the table 10.

Table 10: The most beneficial graduate marketing courses

Category label	Count	Percent of the Responses	Percent of the Cases
Sales and Sale's Management	27	14,4	71,1
Strategic Marketing Planning	21	11,2	55,3
Marketing Communications and Promotions	19	10,2	50,0
Public Relations and Corporate Communications	18	9,6	47,4
Consumer Behavior	16	8,6	42,1
Market Research	15	8,0	39,5
Strategic Brand Management	13	7,0	34,2
Service Marketing	12	6,4	31,6
Direct and Internet Marketing	10	5,3	26,3
Business-to-business Marketing	9	4,8	23,7
Marketing Management	9	4,8	23,7
Foreign trade	8	4,3	21,1
International Marketing	7	3,7	18,4
Trade Management	2	1,1	5,3
Management	1	0,5	2,6
Total	**187**	**100,0**	**492,1**

If we compare those results with the core skills required from graduates, we can notice some more inconsistency. Managers stated that the preferable core skills are those related to management, specifically Marketing Management, while this subject was noted on tenth place

of the most beneficial courses. Furthermore, sales and sales management is listed as first, and this indicates policy of a short term benefit and tendency to increase cash flow at the moment and not to establish strategic planning for the future.

6. DISCUSSION

The main goal of this research is a deeper understanding of skills set by one business major graduate. First thing that we should further analyze is the fact that basic management skills are wanted from marketing graduates. This can correlate with the opinion of Middleton and Long (1990), who reported that "employers do not differentiate between marketing and management skills". Perhaps marketing management and overall marketing capabilities are something they closely relate to marketing itself. Since marketing approach to business is necessary for the success, managers might see those two issues as extremely similar, and identify marketing with management. The other reason might lay in the ignorance toward marketing, and the fact that when they employ graduate, they want her/him to solve broad management issues, regardless of her/his major. While the leading positions are occupied by management area, unlikely, on the third place is creativity with also high number of responses. This is the main connection with marketing, since the creativity is the most visible element of marketing and most of the managers could identify marketing with creativity.

As previously stated, core skills mentioned by managers are in disagreement with the most beneficial graduate courses in marketing. On this list, first place by far, occupies sales and sales management, while marketing management is far down the list. Second most frequent course is strategic marketing planning. Out of this, we can conclude that there are two different types of managers, ones that follow the philosophy "blitz krigh" and they focus on "hard sell", while the other type of managers act according to "lose in short run in order to gain in a long run" and they are interested in strategic marketing planning. Furthermore, in every analysis, marketing and corporate communications, promotion and public relations, are ranked very high. Managers are aware of how important is to build a strong brand and positive image.

Acting upon this advice, managers in education should increase benefit from well known brand of MBA. Managers indicated that they prefer specialized MS program over the MBA when they were described and not named. After naming them as such, MBA becomes greatly preferred which is nothing but the brand recognition and bias towards this popular, world-wide known master program. As well as in Ellen and Pilling (2002) research, we found out that MBA students are more likely to receive job promotion then the MS graduates. This is also important advertising toll for marketing the MBA.

7. CONCLUSION

Number of graduate students is expanding faster than the market for traditional graduate jobs; graduates are more diverse in age, social background and motivations, while the labor market which they enter is more complex and volatile. There is no lack of enthusiasm for further education among students and graduates. Furthermore, it is emphasized that professional development is based around the requirement for graduates, their role within an organization

and the employers' needs. Enhancement of skills does not come purely from attending training courses, but a mix of learning and development approach can be beneficial.

Indeed, Harvey (1999) argues that a critical purpose of higher education is not so much the delivery of employable skills in some generic sense but the development of "critical lifelong learners". This, he maintains, enables students to go beyond the narrow, "safe" knowledge base of their academic discipline to the post-education world. Evetts (1998), for example, argues that "lifelong learning is motivated and planned activity of the individual (engineer) to ensure his/her own professional development". In conclusion it seems that the general consensus from higher education institutions is that the current and future employment market requires graduates to be equipped with a range of skills. Applicants need to be able to demonstrate their core transferable skills in addition to their academic success.

In the process of creating life long learners, at the University of Sarajevo, we should focus to promote MBA graduate study at the moment, since market is willing to recruit such a graduate.

COMMITMENT AND LOYALTY IN MARKETING RELATIONSHIPS ON BUSINESS-TO-BUSINESS MARKETS

1. INTRODUCTION

Markets are becoming increasingly competitive and firms are ever more concerned with customer retention and loyalty (Dick and Basu, 1994; Parvatiyar and Sheth, 2000). Not only it is easier to keep existing customers compared to acquiring new ones, but they also represent the best possibilities for profit growth. Additionally, several researchers (Heskett et al., 1997; Woodruff, 1997) have pointed out that customer loyalty is an important source of competitive advantage. Since firms strive to have loyal customers, one of the key questions that practitioners and researchers face is what makes customers loyal.

Commitment has become one of the most frequently studied variables in studies of buyer-seller marketing relationships on business-to-business markets (Gilliland and Bello, 2002; Kim and Frazier, 1997a; Morgan and Hunt, 1994; Wilson, 1995). While researchers of business-to-business relationships agree on the importance of this construct, differences exist in its conceptualization and operationalization (Gilliland and Bello, 2002; Kelly, 2004; Kim and Frazier, 1997a; Sharma et al., 2006). The majority of researchers have studied commitment as a global construct that measures the intention to continue the relationship. However, in the last ten years there have been some attempts to transfer findings from organizational psychology to marketing relationships and study commitment as consisting of three components (affective, calculative and normative) that reflect different motivations for continuing the relationship. Realization that commitment consists of three components has implications for management of customer relationships. Providers have to first realize that customers continue relationships due to three reasons: because they want to, because they feel they have to and because they feel they ought to. On the basis of this premise providers can develop appropriate tactics to influence different components of commitment (Bansal et al., 2004).

The purpose of this paper is to examine commitment as a three-dimensional construct, and test relationships between components of commitment and their influence on customer loyalty. We propose that commitment consists of three different components that have different effects on relationship outcomes. On the basis of results we propose implications for managers about developing appropriate tactics to influence those components of commitment

that favorably influence customer loyalty. The context of this study is marketing research industry in Slovenia. This study also aims to add to the knowledge on marketing relationships in marketing research industry. The scarcity of published work in this sector provides us with an interesting apparent paradox that firms that focus on gaining and understanding the requirements of their clients' customers may not be clear about the requirements of their own clients (Donnelly et al., 2000). The majority of published research was done in the context of the Western economies, while there is even less published work on this sector in transitional and post-transitional economies.

2. COMMITMENT AND LOYALTY

2.1. Commitment

Commitment has been defined as 'an implicit or explicit pledge of relational continuity between exchange partners' (Dwyer et al., 1987, p. 19). Moorman et al. (1992, p. 316) defined it as 'an enduring desire to maintain a valued relationship'. Common to the different definitions of commitment is that commitment is characterized by a disincentive to replace relationship partners (Young and Denize, 1995).

Definitional work on the construct of commitment began in the sociology and psychology disciplines. Sociologists focused on societal and social factors that constrained or committed individuals to a consistent line of activities (Becker, 1960; Kanter, 1968), while psychologists defined commitment in terms of decisions or cognitions that bind an individual to a behavioral disposition (Festinger, 1957; Kiesler, 1971; in Pritchard et al., 1999). Later on organizational behavior theorists defined commitment as intent to remain, along with certain personal and environmental factors that strengthen that intent. Commitment was inferred from the employee's beliefs, opinions and their level of intent to act in a particular way (Pritchard et al., 1999). Dwyer et al. (1987) and Wilson and Mummalaneni (1986) introduced the concept of commitment to marketing relationships literature (Rylander et al., 1997). However, we should not overlook that IMP Group researchers studied commitment in marketing relationships before that date (e.g. Håkansson, 1982).

Most researchers in marketing have conceptualized and operationalized commitment as a global construct. However, researchers observing relationships in organizational psychology have pointed out three distinct motivations underlying the desire for continuity (Allen and Meyer, 1990) and during the last decade there have been some attempts to transfer these findings to marketing relationships (Bansal et al., 2004; Berghäll, 2003; De Ruyter and Semeijn, 2002; De Ruyter and Wetzels, 1999; De Ruyter et al., 2001; Gilliland and Bello, 2002; Gounaris, 2005; Kim and Frazier, 1997a, 1997b; Kumar et al., 1994). The three components of commitment that are (to some extent or completely) included in these models are: *affective*, *calculative* and *moral* or *normative*. All these components of commitment pertain to psychological states, but they originate from different motivations for maintaining a relationship (Geyskens et al., 1996). An *affectively committed* partner wants to stay in the relationship because it likes the partner, enjoys the partnership and it feels a sense of loyalty and belongingness. A *calculatively committed* partner stays in the relationship because it feels it needs to given the significant anticipated termination or switching costs. And lastly, *normatively committed* partner stays in the relationships because it feels it ought to.

2.2. Loyalty

Loyalty has been defined as a construct that measures the probability that the buyer will return and is ready to perform partnering activities such as referrals (Bowen and Shoemaker, 2003). Some authors (Bolton et al., 2003; Lapierre et al., 1999; Woo and Ennew, 2004; Zeithaml et al., 1996) refer to a similar concept as *behavioral intentions* that include renewing the contract, making recommendations and increasing patronage (Bolton et al., 2003; Zeithaml et al., 1996). Jacoby and Kyner (1973, p. 2) define loyalty as '(1) biased (i.e., non-random) (2) behavioral response (i.e., purchase) (3) expressed over time (4) by some decision-making units (5) with respect to one or more alternative brands out of a set of such brands and (6) a function of psychological (decision-making, evaluative) processes.' Already in the 1960s researchers pointed out that loyalty could be seen as a combination of repeated purchase behavior and positive attitude towards the brand (Day, 1969). The majority of definitions of loyalty therefore include a behavioral and an attitudinal component. The reason for differing between behavioral and attitudinal definitions comes from the approach to studying loyalty that can be stochastic (loyalty is behavior) or deterministic (loyalty is attitude). Nevertheless, the majority of loyalty definitions reconcile the two approaches into one definition (Odin et al., 2001).

2.3. Relationship between commitment and loyalty

Researchers are not unanimous on the relationship between commitment and loyalty (see table 1). Some researchers believe that loyalty is the same as commitment; some think these two constructs are not even related and some that commitment is part of 'true' loyalty. However, the majority of researchers believe that these two constructs are related but different and that commitment is an antecedent of loyalty.

Table 1. Proposed relationships between commitment and loyalty

Relationship	Author(s)
No relationship	Oliva et al. (1992)
Synonyms	Morris et al. (2001); Sharma and Patterson (2000); Žabkar (1999)
Commitment is part of ('true') loyalty	Amine (1998); Assael (1998); Knox and Walker (2003); Kumar and Shah (2004); Oliver (1999); Shankar et al. (2003)
Loyalty is a part of commitment	Gilliland and Bello (2002); Anderson and Weitz (1992)
Commitment is antecedent of loyalty	Baldinger and Rubinson (1996); Bansal et al. (2004); Beatty et al. (1988); Bettencourt (1997); Bloemer and Kasper (1995); Bloemer and Odekerken-Schröder (2002, 2003); De Ruyter et al. (2001); Dube and Shoemaker (2000); Fullerton (2005b); Harrison-Walker (2001); Hennig-Thurau et al. (2002); Morris and Holman (1988); Odin et al. (2001); Pritchard et al. (1999); Too et al. (2001); Wetzels et al. (1998)

Researchers have more frequently studied the concept of loyalty in the context of consumer markets while the concept of commitment in the context of business-to-business markets (Liljander and Strandvik, 1995; Žabkar, 1999). Liljander and Strandvik (1995) point out that these two concepts are not synonyms but related constructs that originate from different research traditions. The main difference between consumer and business-to-business markets is that in the latter loyalty is usually more long-term oriented due to investments and adaptations in a relationship (Morris and Holman, 1988).

When trying to define the difference between commitment and loyalty we can say that commitment is predominantly cognitive and refers to the power of attitude (Pritchard et al., 1999; Beatty et al., 1988). Gruen (1995) proposes that commitment is more a motivator for behavior and not behavior as such. Bettencourt (1997) emphasizes that commitment is not a synonym for loyalty. Commitment is more an attitude the consequence of which is also loyalty. Looking at commitment as composed of different components enables us to separate commitment from loyalty. Using this conceptualization we can more transparently show how cognitive and affective antecedents affect future behavior (loyalty or disloyalty) (Zins, 2001). We can conclude that the main difference between loyalty and commitment is in that commitment includes predominantly motivation and attitude to continue a relationship (this attitude is then composed of different components) and we measure strength of this attitude. On the other hand, loyalty is a mixture of attitude and behavior that is most often defined as repeat patronage and referral behavior. In line with thinking of Too et al. (2001) we can say that a firm is committed to a relationship with another firm, while it is loyal to the firm as a provider or to its products and services.

2.4. Development of the hypotheses

We propose two sets of hypotheses. In the first set of hypotheses we propose relationships between components of commitment. Researchers in the area of organizational psychology, marketing relationships on business-to-business and business-to-consumer markets have found positive and strong correlation between affective and normative commitment (Bansal et al., 2004; Meyer et al., 2002; Kelly, 2004; Kumar et al., 1994). In line with these findings we also propose that these two constructs are positively correlated. Researchers have found mixed results regarding relationship between affective and calculative commitment. Kumar et al. (1994) found no correlation between calculative and affective commitment, while Kelly (2004) found this correlation to be positive. In line with Kumar et al. (1994) and in-depth interviews we assume these two components of commitment are not correlated. As for the relationship between normative and calculative commitment researchers have found moderate positive correlation between these two components of commitment (Kelly, 2004; Kumar et al., 1994). In line with these findings we propose positive correlation between calculative and normative commitment. Therefore, the following hypotheses are put forward:

H1: Affective and normative commitment are positively correlated.
H2: Affective and calculative commitment are not correlated.
H3: Calculative and normative commitment are positively correlated.

In the second set of hypotheses we propose relationships between components of commitment and loyalty. Empirical studies in relationship marketing show that commitment is a key antecedent of customer loyalty (Fullerton, 2005a). Wetzels et al. (1998) and De Ruyter et al. (2001) discovered that both affective and calculative commitment positively affect buyer's intention to continue the relationships. Kumar et al. (1994) also established that affective commitment has the most favorable influence on intention to stay in the relationship. Similarly, normative commitment positively influences intention to stay, while on the other hand, calculative commitment negatively influences the wish to continue the relationship. Affectively committed partner will invest more in the relationship, its effectiveness will be higher and it will be more resistant to opportunistic behavior. Positive effects of normative commitment are lesser than those of affective commitment, but normatively committed firm will be ready to continue relationship and invest it in. It will also not seek alternative providers. On the other hand, calculative commitment will negatively influence the wish to

continue relationship and invest in it. Calculatively committed company will also more actively seek alternative providers (Kumar et al., 1994). Gounaris (2005) similarly found different consequences of calculative and affective commitment. While affective commitment creates positive intentions that help to maintain and strengthen relationships, calculative commitment has just the opposite effects on behavioral intentions. One of possible explanations is that with creating dependence and locking customers in the relationship they feel trapped in a relationship. Wetzels et al. (1998) also found that creating affective commitment is the most important because it has the strongest effect on the customers' intentions to continue relationship and consequently on provider's revenues. Therefore, the following hypotheses are proposed:

H4: Affective commitment positively influences loyalty.
H5: Calculative commitment negatively influences loyalty.
H6: Normative commitment positively influences loyalty.

3. RESEARCH DESIGN

3.1. Measure development

In the exploratory research nine in-depth interviews were conducted on clients' side to get more insight into connections between the variables in our research. Using the findings from in-depth interviews and existing research in relationship marketing a structured questionnaire was designed. Operationalization of commitment components was based on Kumar et al. (1994), while operationalization of loyalty on Zeithaml et al. (1996). After a scale refinement in line with five experts' opinions the questionnaire was tested on ten members of the population.

The set of items for each construct was examined with exploratory factor analysis (principal axis factoring with varimax rotation) to identify items not belonging to the specified domain. Items with loading less than 0.50 and/or cross-loadings greater than 0.35 were discarded. *Reliability* of the measurements was estimated using Cronbach's α. The scale for calculative commitment (two-item scale measuring company's motivation to stay in the relationship due to a lack of alternatives) had moderate reliability (α = 0.70), the scale for normative commitment (three-item scale measuring motivation for staying in the relationship because the employees who work with the provider would feel guilty for changing the provider and because the company feels it ought to stay in the relationships) had very good reliability (α = 0.75), while the scales for affective commitment (four-item scale measuring company's motivation to stay in the relationship because it is pleasant to work with the provider, it enjoys the relationship and feels a sense of belongingness) (α = 0.84) and loyalty (five-item scale measuring repeat patronage and positive word of mouth) (α = 0.82) had exemplary reliability. *Validity* was estimated by performing exploratory factor analysis. On the basis of the factor analysis it was concluded that the internal consistency of operationalization of the variables of affective, calculative and normative commitment and loyalty, while not perfect, was sufficient to allow us use the summated variables in the subsequent analysis.

3.2. Sample and data collection

The context of this study is the marketing research industry in Slovenia. Data was gathered from managers responsible for marketing research in marketing research client companies. An e-mail with an invitation was sent to 500 addresses and later data was gathered through telephone interviews. The precondition for inclusion in the survey was that a firm had ordered at least one research project from a marketing research agency in the two previous years. Out of the 500 companies, only 230 fulfilled the conditions for inclusion in the survey. The others had not ordered research at marketing research agencies in the last two years. Data were gathered from March 2005 until July 2005. 150 telephone interviews were completed, with a response rate of 65.2 %. Due to the telephone interviewing we had control which firms were included in the sample (firms that are actually clients of marketing research providers) and who were our respondents (employees who were the most knowledgeable on this topic).

In order to ensure variability in marketing relationships included in the survey the respondents evaluated their relationship with the agency that carried out their most recent research project. The respondents were asked to answer the questions while keeping in mind the relationship with the provider of the last research they conducted. The respondents were asked to express their agreement with the given statements using a seven-point Likert-type scale (from 1 – not at all true, to 7 – completely true). Questionnaire also included questions about the size of the company, industry in which the company operates, duration of the relationship, number of years respondent spent working with this provider etc.

3.3. Sample characteristics

The majority of companies that responded to the questionnaire were providers of business services (24.7%), followed by manufacturing (23.3%) and trade companies (22%). The rest were providers of services for consumers (12.7%), services for both companies and consumers (11.3%) while 6% came from other industries. 40.7% of the companies had up to 50 employees; there were 24.7% of companies with 101-500 employees and 21.3% of companies with over 501 employees, while there were fewer companies with 51-100 employees (13.3%). The average duration of a relationship is 4.4 years. We also examined what is the value share of projects done by this provider among all research projects carried out with outside suppliers of market research. The average value share of research projects conducted by the studied agency is 76.1%. This means that the majority of respondents had described their relationship with their most important provider of market research.

4. RESULTS

Clients on average indicated the highest agreement with the statements measuring affective commitment (table 2). They expressed the highest agreement with the statement that they continue the relationship with the examined research agency because it is pleasant to work with that agency (mean 5.52), followed by other statements measuring affective commitment. Statements relating to calculative commitment had lower averages, all being below 4 that was the centre of the scale. Among these statements respondents expressed the highest average agreement with the statement that they stay with this research agency because there are no good alternatives (mean 3.02). Respondents expressed even lower agreement with statements

measuring normative commitment. Among these statements respondents expressed the highest average agreement with the statement that they feel a sense of duty to remain a client to this agency (mean 2.34). Out of all statements the respondents expressed the lowest agreement with the statement that it would be dishonorable to leave that agency even if it were to their firm's advantage (mean 1.79). We can conclude that clients of market research firms continue relationships out of emotional reasons, while calculative and normative reasons (as measured in this research) do not play a significant role.

Among variables measuring loyalty (table 3) respondents on average expressed the highest agreement that they had said positive things about this agency to their colleagues from other firms (mean 5.34), followed by recommending this agency to their colleagues from other firms who had sought their advice (mean 5.14). On average respondents expressed the lowest agreement with the statement that they encouraged other firms to do business with that agency (mean 3.27). We can conclude that respondents on average engaged in positive word of mouth behavior, while they were not so confident about working with this research agency in the future.

Table 2. Descriptive statistics for measurement variables of commitment components

Variable	Mean	Std. deviation
It is pleasant working with the agency, that's why we continue to work with them (acom1).	5.52	1.32
We want to remain a client of this agency because we genuinely enjoy our relationship with the agency (acom3).	4.83	1.56
Our decision to remain a client of this company is based on our attraction to the things the agency stands for as a company (acom2).	4.77	1.54
Because we like working with the agency we want to remain their client (acom4).	4.63	1.58
It is too difficult to switch to another agency because of the lack of good alternatives; therefore we are staying with the agency; otherwise we'd consider leaving (ccom4).	3.02	1.93
We feel a sense of duty to remain a client to this agency (ncom2).	2.34	1.51
Right now, staying with the agency is a matter of necessity since no feasible alternatives exist (ccom1).	2.31	1.93
Employees who work with the agency would feel guilty if we dropped them as a supplier (ncom1).	2.28	1.54
Even if it were to our firm's advantage, we feel it would be dishonorable if we were to leave the agency (ncom4).	1.79	1.17

Table 3. Descriptive statistics for measurement variables of loyalty

Variable	Mean	Std. Deviation
I told positive things about this research agency to my colleagues from other firms (loy1).	5.34	1.64
I recommended this research agency to colleagues who sought my advice (loy2).	5.14	1.97
Our firm considers this research agency as the first choice when buying market research services (loy4).	4.73	1.78
It is probable that our firm will increase business with this research agency in the following few years (loy5).	4.33	1.72
I encouraged other firms to do business with this research agency (loy3).	3.27	1.99

In the first set of hypotheses we tested relationships among components of commitment (table 4). First, results reveal a positive correlation between affective and normative commitment (H1 is supported). Our results are in line with several other studies (Bansal et al., 2004; Meyer et al., 2002; Kelly, 2004; Kumar et al., 1994); however, in our case this correlation was weak, while other studies found a moderate to strong correlation between these two constructs. Second, the correlation between affective and calculative commitment is also weak but negative. This is contrary to the proposed hypothesis (H2 is not supported) and findings of other researchers. For example, Kumar et al. (1994) found no correlation, while Kelly (2004) found positive correlation between these two constructs. Lastly, we proposed a positive correlation between normative and calculative commitment (Kelly, 2004; Kumar et al., 1994), while the results show this correlation is not statistically significant. H3 is as therefore not supported.

Table 4. Results of hypothesis testing among components of commitment

Hypothesis	Proposed correlation	Correlation coefficient	Result
Affective commitment – normative commitment (H1)	+	0.33 ($p = 0.00$)	Supported
Affective commitment – calculative commitment (H2)	0	-0.32 ($p = 0.00$)	Not supported
Calculative commitment – normative commitment (H3)	+	0.09 ($p = 0.13$)	Not supported

Relationships between components of commitment and loyalty were tested using a multiple regression analysis. We used summated variables as explained in chapter 3.1. *Enter* method was used for entering independent variables in the analysis. Regression coefficient for affective commitment and constant are statistically significant. On the other hand, regression coefficients for calculative and normative commitment are not, indicating that these two constructs have no statistically significant effect on loyalty (table 6). Results therefore show that only affective commitment is a significant predictor of customer loyalty. With affective commitment we can explain 33.5% of variance in loyalty (table 5). We can conclude that affective commitment is relatively strongly correlated with loyalty and it is a relatively good predictor for this dependent variable. H4 is therefore supported, while H5 and H6 are not supported. Our findings regarding the influence of affective commitment are in line with findings of De Ruyter et al. (2001), Gounaris (2005), Kumar et al. (1994) and Wetzels et al. (1998). On the other hand, our findings regarding calculative commitment are not in line with findings of researchers in other contexts. While some researchers (Gounaris, 2005; Kumar et al., 1994) discovered a negative influence and some (De Ruyter et al., 2001; Wetzels et al., 1998) a positive influence of calculative commitment on loyalty, the results of this study indicate there is no statistically significant relationship between these two constructs.

Table 5. Regression model for loyalty to research agency

Model	R	R^2	Adj. R^2	Std. error
1	0.59(a)	0.35	0.34	5.63

(a) Independent variables: (constant), affective commitment, calculative commitment, normative commitment

Table 6. Standardized regression coefficients for loyalty to marketing research provider

Model	Variable	Unstandardized coefficients		Standardized coefficients		
		B	Std. error	Beta	t	*Sig.*
1	(Constant)	7,43	2,36		3,15	0,00
	Affective commitment	0,79	0,11	0,56	7,36	0,00
	Calculative commitment	-0,10	0,15	-0,05	-0,71	0,48
	Normative commitment	0,06	0,14	0,03	0,42	0,68

Dependent variable: loyalty

5. CONCLUSIONS

The purpose of this paper was to examine commitment as a three-dimensional construct, and test relationships between components of commitment and their influence on behavioral intentions of customers. We proposed that commitment consists of three different components that have different effects on relationship outcomes (customer loyalty). Results of our study confirm our thesis that components of commitment are different constructs. Affective commitment is weakly positively correlated with normative and weakly negatively with calculative commitment; while the correlation between calculative and normative commitment is not statistically significant. Results also show that these three components of commitment have different effects on customer loyalty. Out of the three components only affective commitment was found to have a statistically significant influence on customer loyalty.

Our results therefore confirm the dominant role of affective commitment in marketing relationships. Results of our study are in line with Sharma et al.'s (2006) conclusion made on the basis of literature review that affective commitment is stronger and plays a more important role than other types of motives in developing and maintaining long-term relationships. Affective commitment was also found to be the strongest motivator for customer loyalty in studies done by De Ruyter et al. (2001), Gounaris (2005), Kumar et al. (1994) and Wetzels et al. (1998). As Berghäll (2003) points out relationship-marketing tools are necessary only in situations when emotional elements enter into evaluation of the relationship. This is a consequence of a theoretical premise that emotional involvement extends marketing relationship from a transaction-based to the real 'relationship', when feelings are involved.

On the other hand, results of this study indicate negligible roles of calculative and normative commitment in relationships between marketing research agencies and their clients. The reason why calculative commitment was found to be low among clients of marketing research agencies could lie in the structure of the market. According to findings from in-depth interviews clients of marketing research agencies in Slovenia believe that there is an adequate number of marketing research providers in the market and that their offers are competitive. The lack of alternatives is therefore not a significant motivator to continue a relationship with marketing research agencies in Slovenian market.

As for normative commitment, most researchers on business-to-business markets (with the exception of Kumar et al. (1994) and De Ruyter and Semeijn (2002)) did not even include this

component in relationship models. The reason could be related to culture. Meyer and Allen (1997) propose that normative commitment plays an important role in cultures that are highly collective according to Hofstede's classification. Although Hofstede's data for Slovenia from 1971 indicate strong collectivism (IDV = 27), high uncertainty avoidance (UAI = 88), high power distance (PDI = 71) and a feminine value set (MAS = 17) (Hofstede, 2001), more recent research has revealed the very opposite results: very high individualism (IDV = 107.7), together with high uncertainty avoidance (UAI = 71.7), low power distance (PDI = 27.8), a feminine value set (MAS = 20.3) and a relatively strong short-term orientation (LTO = 32.6) (Jazbec, 2005). One could conclude that during the transition period Slovenian culture apparently changed and became more similar to the cultures of Western countries. Clustering further revealed that the Slovenian business culture closely resembles some cultures of developed old EU members (Jazbec, 2005).

On the basis of these results we cannot rule out studies that measured commitment as a global construct (implicitly measuring affective component) as inappropriate. Future research is needed to explore antecedents of the three components of commitment and test them all in a model. While the narrow focus on commitment as one construct helps us understand marketing relationships the multi-component view of commitment should give us deeper understanding of marketing relationships (Fullerton, 2005b). Bansal et al. (2004) maintain that conceptualization of commitment with three components more fully captures domain of commitment.

As for managerial implications, knowing that commitment consists of multiple components, marketing managers can attempt to increase the component of commitment that has the most favorable effects on customer loyalty. Consequently they can keep their customers and achieve profits (Kelly, 2004). An important implication for managers of marketing research firms is that affective commitment is the most important one for customer loyalty.

While this research answers some questions, it at the same time opens new ones. Future research should undertake qualitative interviews to further explore the normative and calculative components of commitment and seek to identify their antecedents. Although the existing literature has already lifted the veil, more empirical study is needed for a new model to be built and tested. Special attention should also be paid to the operationalization of normative and especially calculative commitment since other researchers (e.g. Meyer et al., 2002) in the area of organizational behavior selection point to problems with the current operationalization of calculative commitment.

1. CUSTOMER ORIENTATION: STARTING POINT

Some authors consider customer orientation as equivalent to market orientation (Kohli, Jaworski, 1990, p.3, Deshpande, Farley, Webster, 1993, p.33, Webster, 1992, p.10, Shapiro, 1998, p.119, Deshpande, Farley, 1999b, p.228) because customer is the central element of market orientation research (Kohli, Jaworski, 1990, p.3). Thus according to Kohli and Jaworski (1990, p.3) customer and market orientation have the same definition and that is that market orientation refers to the "organizationwide generation, dissemination and responsiveness to market intelligence". Overall process represents collecting market information and information about customers' present and future needs and preferences.

Some authors consider market and customer orientation as synonyms because of the marketing concept itself. Marketing concept represents "intention to identify and understand customers' needs and wants as well as intention to adapt some of marketing mix elements, including product, and all that in the purpose of needs and wants satisfaction" (Houston, 1986, p.86). Number of authors point out that market orientation is a marketing concept implementation. From that view, the simultaneous and interchange use of market and customer orientation for the same phenomenon is not surprising. Everything is about customers, so there is no solid reason to distinguish between these two orientations when they really represent the same view for doing business.

Other authors believe that there is a difference between market and customer orientation and that market orientation (Narver, Slater, 1990, p.21) "consist of customer orientation,

competitor orientation and interfunctional coordination". Further more, these authors emphasize that companies constantly need to create superior value for its target customers, which is possible with coordination of collected information about consumers and competitors. Following Narver and Slater (1990, p.22) customer orientation includes "all of the activities involved in acquiring information about consumers in the target market and disseminating it throughout the business (es)". This helps increase the possibility to create superior value for customer. Acquiring information that develops customers' knowledge is a continuous process. In order to satisfy customers it is necessary for a company to recognize their value chain, anticipate their future needs as well as recognize potential customers. Narver and Slater (1990, p.21) emphasize customer orientation but they say that all three elements are equally important. However, Siguaw, Diamantopoulos (1995, p.85) and Hajjat (2002, p.429) have a different view and emphasize that customer orientation is the key component of market oriented business.

Deshpande, Farley and Webster (1993, p.5) offer a different view. They say that customer orientation is "set of beliefs that put the customer's interest first, while not excluding those of all other stakeholders such as owners, managers and employees, in order to develop a long-term profitable enterprise". They stress, that a company need to focus on information about needs, values and beliefs not only from actual but as well as from potential customers. Company needs this for customer orientation to become a part of its corporate culture and as a starting point for its development and growth.

Furthermore, customer orientation is an organizational culture that emphasizes customer as a central/key point for a strategic planning and implementation (Chen et al., 2004, p.414, Nwankwo, 1995, p.7) and as an incentive for developing company's sustainable competitive advantage (Appiah-Adu, Singh, 1998, p.387). Respectively, company need to have customer-oriented culture to provide superior value for customers.

Success in providing superior value for customers derives from researching their needs, wants and preferences. This is a source for company's innovativeness. Furthermore, turbulent market and non-rational consumers that are under market environment influences (Dickinson, Herbst, O'Shaughnessy, 1986, p.18, Nwankwo, 1995, p.8), impose a need for company to monitor competition.

Collected market information facilitates company efforts in providing more satisfaction to customers than competitor (Siguaw, Brown, 1994, p.107). This is possible, if company uses market information to adapt products and services in order to provide customers with superior value than competitors. Company innovativeness is essential for developing new products that can delight customers. By doing this, company is becoming leader in providing superior value to customers (Vandermerwe, 2003, p.263) as well in setting standards for others to follow.

Following some authors, customer orientation components are (Narver, Slater, 1990, p.13, Deshpande, Farley, Webster, 1993, p.34, Siguaw, Brown, 1994, p.110, Egan, Shipley, 1995, p.809, Daniel, Darby, 1997, p.132,144, Appiah-Adu, Singh, 1998, p.388, Hajjat, 2002, Rindfleisch, Moorman, 2003, p.422, Caruana, Pitt, Ewing, 2003, p.26, Chen et al., 2004, p.417, Dulaimi, 2005, p.3):

1. associated with consumers – business oriented toward customers, knowing customers and their product value, serving customers and putting their interest in first place, constant consumers needs, consumers characteristics, quality consumer base, devoted

consumers, understanding consumers needs, satisfaction, measuring satisfaction, relationship with consumers, consumers response;

2. associated with competition – acquainted competitors, possessing best products in industry, competition concentration;

3. associated with market – routine or regular measurement of consumer services, using market information for product development, market competition based on product or service differentiation, market dynamics;

4. associated with product and services – quality, providing reliable services, services system, image and reputation (as well as company's), post-sales service, services evaluation, product/services characteristics, value characteristics;

5. associated with employees – communication and contact with consumers, flexible activities, skills, constant promotions, job attitude, job satisfaction;

6. associated with company – creating superior value for customers, researching customers, company business transparency and company quality.

Consumer orientation active realization creates consumer base of knowledge. Company has to use base of knowledge to create products and services that can provide satisfaction to present customers' needs and wants. Company has to take care about present, potential and unexpressed consumer needs and wants. In order to accomplish that it has to research present, past and potential consumers (Shmalensee, 1992, p.130). Received information from customers, company must record and store for usage in business process (Davenport, Harris, Kohli, 2001, p.16). Using and responding upon collected information (Brandt, 1992, p.90) allow company to modify supply to provide satisfaction and superior value to consumers.

Customer knowledge base is developed and replenished constantly. In this process, important role have employees when they communicate (Brandt, 1992, p.90) and develop relationships (Day, 1998, p.8, Slater, 2001, p.230) with customers. However, employees must have access to collected information that they can use it in their interaction with customers. It can be said that employees help company to create long-term relationships with consumers that contribute to company success and that all departments together create company business results (Pitta, Franzak, Little, 2004, p.514).

Besides collecting information about customers, company has to take care about competitors' efforts and other market influences (Kohli, Jaworski, 1990, p.4) that are directed towards customer satisfaction, can drag customers' away (Day, 1999, p.16) as well as modify their needs and wants. In order to minimize these influences, company monitor changes in market environment and actively seek opportunities to adapt to new market situation so that can provide superior value for target customers (Narver, Jacobson, Slater, 1999, p.199). Moreover, market oriented company can better respond to new events and trends in the environment (Day, 1994, p.43).In such a way, it can keep present and attract new customers.

It is important for company to implement lifelong value concept. Essence of this concept is that company need to observe customer not as a single transaction (Vandermerwe, 2003, p.264) but it is important to develop relationships with them and to implement continuous value giving behavior. Developing customer knowledge base helps company in simultaneous value creation and to use that collected knowledge for improving business.

Therefore, customer orientation includes customer needs and wants satisfaction; anticipation of these needs so that consumer expectations can be satisfied and changing marketing-activities to keep up on unstable consumers needs and changes in market environment. This

requires a continuous track in customers' need as a base for innovation and constant satisfaction improvements.

2. CUSTOMER ORIENTATION AND COMPETITIVE ADVANTAGES

Customer, as a centre of customer orientation, guides company business. This implies strategic flexibility as a prerequisite for company response in dynamic competitive environment (Wang, Lo, 2003, p.496). To achieve and maintain competitive advantage, a company must be adaptive and respond upon market changes (Akimova, 2000, p.1130), create advantages in marketing-mix and demonstrate more efficiency than competitors (Akimova, 2000, p.1146). Company's capabilities help develop sustainable competitive advantage and grow profitability (Day, 1994, p.40). Developed and sustained competitive advantage (Slater, Narver, 1994a, p.22) for outcome generate superior businesses results.

Appreciating different authors' views, customer orientation implementation creates competitive advantages classified into four groups:

1. competitive advantages related to product

Company innovativeness manifests in developing products tailored to customers' needs and wants. When company research customers it gets information about satisfaction and then starts process of value creation. We can say, that successful market innovation foster company business results (Deshpande, Farley, Webster, 1993, p.23, Slater, Narver, 1994a, p.25) as well as increases a level of company's customer orientation (Han, Kim, Srivastava, 1998, p.40, Appiah-Adu, Singh, 1998, p.387).

Moreover, company has to observe competition because of its influence on customers (Wang, Lo, 2003, p.491) as well as on company's competitive capability (Hunt, Morgan, 1995, p.8). Continuous customers' monitoring offer different insights about product quality requirements and need for their modification (Wang, Lo, 2003, p.487, Hunt, Morgan, 1995, p.8, Caruana, Pitt, Ewing, 2003, p.36, Appiah-Adu, Singh, 1998, p.391). In order to bring satisfaction to customers, competitive strategy needs to incorporate customers perceived level of product quality (Slater, Narver, 1994a, p.25).

2. competitive advantages related to customers

Generating customer satisfaction creates a satisfied customer base and provides company more information for adjusting product and services to changing customers' needs and wants (Pelham, Wilson, 1999, p.169, Wang, Lo, 2003, p.487). Collected information about customers and their value chain (Deshpande, Farley, Webster, 1993, p.23) is disseminated trough the company and used to respond and modify company's offer (Day, 1994, p.43). Company can develop superior characteristics in providing customer value and this implies that customer knowledge represents competitive advantage (Webster, 1992, p.12, Wang, Lo, 2003, p.495, Davenport, Harris, Kohli, 2001).

Offering satisfaction to customers generates relationship with company (Day, 1994, p.44). On one side, we have satisfied customers and on other, relevant information's source for company. We can say, that creating relationships (Day, 2003, p.82) and relationships

themselves are important strategic resource for company (Webster, 1992, p.1) as well as that managing relationships in value chain is becoming important in defining company key capabilities.

By using relationships with customers, market research is becoming continuous process aimed at collecting information for providing unexpected superior satisfaction (Narver, Jacobson, Slater, 1999, p.201) which helps creating customer loyalty (Wang, Lo, 2003, p.486, Slater, Narver, 1994a, p.25). Company has no urge to invest large amount of capital in attracting new customers because present loyal customers promote company on regular basis (Appiah-Adu, Singh, 1998, p.391, Hill, Alexander, 2003, p.17). This reduces costs and increases company profit (Wang, Lo, 2003, p.489, Caruana, Pitt, Ewing, 2003, p.32) and for all this it customer loyalty represents competitive advantage.

3. competitive advantages related to employees

Company oriented in providing customers satisfaction need to educate their employees so that they can offer superior satisfaction to customers. First step in this process of education is to create satisfied employees. Employees' education is an investment that will increase their competitive capabilities (Slater, Narver, 1995, p.70) as well as competitive capabilities of a company (Day, 1994, p.47).

Empowered and involved in decision-making process employees (Day, 1994, p.46) can more successfully implement customer orientation (Wang, Lo, 2003, p.486) because of their quick response in adjusting service to customers' requirements. If employees are wise and well-managed important changes in culture are happening on regular basis and this indicate need to be empowered (Prestoungrange, 2000, p.94).

4. competitive advantages related to company capabilities

Companies that are implementing customer orientation aim at achieving more customer satisfaction (Wang, Lo, 2003, p.485). Their value system direction is toward customers and this is why it represents company competitive advantage (Webster, 1992, p.12). Collecting and processing information about customers (Slater, Narver, 1994b, p.50) is important. This information helps company to learn how to adapt its business to market opportunities in order to be more successful.

Learning culture is important for company consumers because learning direction is toward understanding and efficient satisfaction of present and future customers needs through new products, services or in some other way (Slater, Narver, 1995, p.71). A company with superior learning skills adapts to market environment changes in a more rapid manner. Emphasis is not only on collecting information's about customers but also on monitoring competition, market environment forces, business partners and stakeholders (Slater, Narver, 1995, p.69).

Customer orientation assists company in developing competitive advantages that derive from providing customer satisfaction. A prerequisite for providing value to customers is developing capabilities that differentiate company from competitors and in the long-run nurture competitive advantage. Company has to monitor market environment changes, respond upon them and at the same time research and fulfill customers' needs and wants. Therefore, basic

capabilities are within company however, it is necessary to adapt them to become sustainable so that in the end company can gain competitive advantage using customer orientation.

3. CREATING CUSTOMER SATISFACTION

Customers give life to company because company's objective is to provide satisfaction as well as to fulfill their needs (Webster, 1992, p.11). Frequent found in satisfaction definitions is comparison and evaluation. Evaluation is subjective and following different authors' customer evaluates and compare:

- level of expectation (adaptability) and experience perception (Oliver, 1980, p.461, Oliver, Linda, 1981, p.90),
- surprises which include product buying and/or use experience (Oliver, 1981, p.27),
- expectation and perception of product performances (Fornell, 1992, p.12, Oliva, Oliver, MacMillan, 1992, p.86),
- present quality and past satisfaction (Anderson, Fornell, Lehmann, 1994, p.63),
- customer's demand and total product performance (Hill, Alexander, 2003, p.30).

Besides analyzing satisfaction through one transaction value, some authors study satisfaction from cumulative perspective. So they:

- compare obtained product characteristics with past satisfaction (Anderson, Fornell, Lehmann, 1994, p.63) or past consumption (Andreassen, 1994, p.18),
- use cognitive and cognition evaluation based on personal experience in paste interactions with company (Storbacka, Strandvik, Grönroos, 1994, p.25) and
- compare product performance perception, expectations and past satisfaction (Johnson, Anderson, Fornell, 1995, p.696) during interactions with company.

Single transaction or cumulative perspective (Anderson, Fornell, Lehmann, 1994, p.54, Wang, Lo, 2003, p.488) is a way to monitor customer satisfaction. Single transaction perspective stresses the satisfaction after interaction and from this perspective, satisfaction is seen as a transaction result. On the other hand, cumulative perspective observes satisfaction for longer period and monitors customers' satisfaction in all interactions. Therefore, cumulative perspective is giving a company a possibility to manage customer satisfaction and in that period create relationships. Relationships give company a possibility to nurture customer satisfaction as well as to influence business performance.

Process of generation of customer satisfaction creates benefits for company (Zeithaml, 1988, p.4, Oliver, 1980, p.464, Fornell, 1992, p.11, Oliva, Oliver, MacMillan, 1992, p.87, Storbacka, Strandvik, Grönroos, 1994, p.23, Andreassen, 1994, p.18, Anderson, Fornell, 2000, p.871):

- Customer side – increased loyalty, reduced customer price elasticity, immunity toward competitors' efforts, reduced transaction costs, positive attitude towards company and its products, low number of customers that leave company, customers increased buying company products,
- Company side – reduced costs for mistakes in functioning and in products, reduced costs for attracting new customers, enlarged costs for competitors, reduced employees

leaving, growing company reputation, making strong and long relationships with company.

In this process, manifested benefits are for company and its functioning as well as for customers and their relation toward company.

Precondition for satisfaction is a process of creating and providing value for customers (Wang, Lo, 2003, p.485, Day, 1998, p.8) greater than competitors' (Brannback, 1997, p.296). Moreover, value created in interactions with company produces customer satisfaction. It is important to discover determinants of satisfaction as well as elements of satisfaction. Understanding elements of satisfaction, i.e. what makes customer satisfied, can help company to manage satisfaction in order to keep customers. Different elements influence satisfaction and we can group them in four categories:

- needs, wants and expectations - expectations need to be satisfied (Anderson, Fornell, Lehmann, 1994, p.54, Andreassen, 1994, p.18, Johnson, Anderson, Fornell, 1995, p.699-700); anticipated, present and past experience (Anderson, Fornell, Lehmann, 1994, p.54); product experience (Johnson, Anderson, Fornell, 1995, p.699-700);
- product/service elements - price (Zeithaml, 1988, p.4, Anderson, Fornell, Lehmann, 1994, p.54); perceived quality (Zeithaml, 1988, p.4, Cronin, Taylor, 1992, p.64, Storbacka, Strandvik, Grönroos, 1994, p.23, Oliver, 1996, p.145, Anderson, Fornell, 2000, p.872); product/service value (Zeithaml, 1988, p.4, Anderson, Fornell, Lehmann, 1994, p.54, Oliver, 1996, p.145, Anderson, Fornell, 2000, p.872); total product characteristics (Andreassen, 1994, p.18, Oliva, Oliver, 1995, p.107, Johnson, Anderson, Fornell, 1995, p.699-700);
- employee satisfaction – creating relationships with customers (Day, 1998, p.8, Slater, 2001, p.230); employee behavior that induces customer satisfaction (Lindgreen, Crawford, 1999, p.237);
- business practice as an element that in interaction with customers creates satisfaction – perception of satisfied customers as investment (Fornell, 1992, p.11); perception of customers as company assets (Anderson, Fornell, Lehmann, 1994, p.55).

All these elements in joint interaction create customer satisfaction.

However, satisfaction is not enough. Satisfied customers are just the beginning of company's intentions to keep customers. From customer satisfacion emerges customer loyalty. To develop customer loyalty, it is important to start the process with satisfaction, because satisfaction (Fornell, 1992, p.12, Diller, 2000, p.30, Hill, Alexander, 2003, p.25) and delivering superior value (Reichheld, 2001a, p.20) that creates sense of satisfaction are preconditions of loyalty. Loyalty and satisfaction are linearly connected, i.e. loyalty is succeeding satisfaction.

Positive influence of loyalty on business performance induces process of loyalty creation. Among others, advantages from loyalty are (Reichheld, 1996a, p.12, Griffin, 1997, p.31, Diller, 2000, p.32, Reichheld, 2001a, p.39, Reichheld, 2001b, p.9-12, Hill, Alexander, 2003, p.17): more security, company and profitability growth.

As stated earlier, value creation process represents customer satisfaction starting point. Alongside with satisfaction company creates loyalty (Reichheld, 2001b, p.12) through process of generating superior value for customers (Reichheld, 1996a, p.12). This influences business

performance and generates sustainable business profitability. Beside that, company must be loyal and dedicated to its customers (Hill, Alexander, 2003, p.20). Particularly, only through total devotion in fulfilling customers' needs and wants and by this creating satisfaction, company develop customer base that creates loyalty and positively influence business performance.

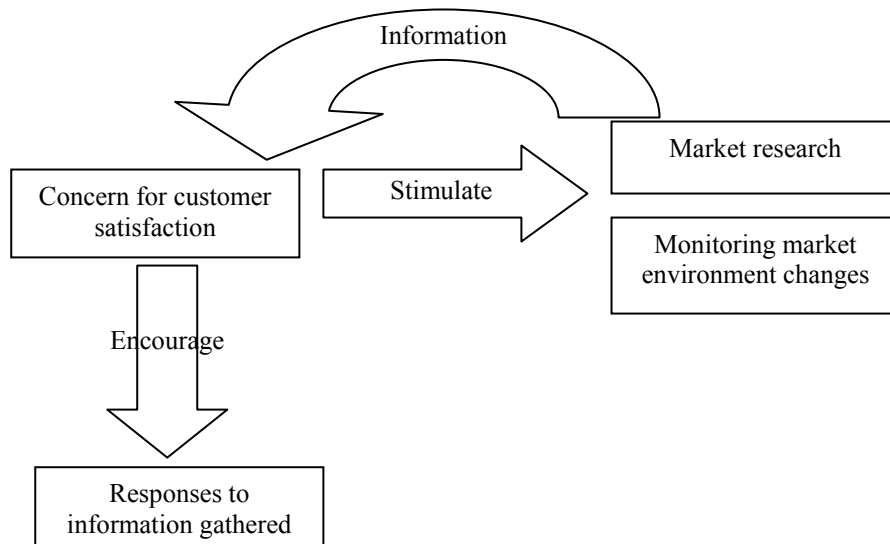
From the theoretical background stated the following model emerged, tested in the field research.


Figure 1. Conceptual model

4. RESEARCH ON CUSTOMER ORIENTATION IN CROATIAN COMPANIES

In their work, many authors indicate that customer interests are starting point for customer orientation (Deshpande, Farley, Webster, 1993), to be precise, their needs and wants fulfilment (Pelham, Wilson, 1999, Wang, Lo, 2003). Therefore, concern for customer satisfaction represents customer orientation foundation.

For successful customer satisfaction process, it is necessary to monitor market dynamics (Kohli, Jaworski, 1990, Deshpande, Farley, Webster, 1993, Pitta, Franzak, Little, 2004), as well as to monitor market environment changes so that company can achieve better business performance from their competitors (Siguaw, Brown, 1994, Wang, Lo, 2003). That is the reason why company must monitor market environment changes.

Some authors in their work imply that market research is necessary to apply for company that wants to fulfill customers' needs and wants in order to satisfy them. Beside market research, company must use additional mechanisms of collecting customers' information (Narver, Slater, 1990, Slater, Narver, 1994b, Nwankwo, 1995, Dulaimi, 2005).

Company responds to gathered market information and uses it for satisfying customers' needs and wants. This affirm authors like Kohli, Jaworski (1990), Day (1994), Narver, Jacobson, Slater (1999), Davenport, Harris, Kohli (2001).

Following from this, we tested the hypothesis:

H1: Among Croatian companies, there are different dimensions of customer orientation present.

Starting point for customer satisfaction concern is a development of a frequent customer's base that determines company success (Narver, Slater, 1990, Reichheld, 2001a). For that success, it is important to appreciate market environment changes, to apply market research and for company to respond to information gathered (Deshpande, Farley, Webster, 1993, Appiah-Adu, Singh, 1998, Reichheld, 2001b). Considering this, we place the following hypothesis:

H2: Business results are associated with customer orientation implementation.

4.1. Research methodology and sample

Information was collected using mail survey in period between January and October 2003. During that period, we collected 112 questionnaires. Sample was rather small and consisted of 270 small and medium enterprises from Croatia. Sample size was determined from the following:

1. project "Transformation by marketing management" ensues from "SMEs' market orientation-an answer to environmental dynamics" project, during which similar research was carried out,
2. in order to perform history analysis, sample was determined from 326 companies that participated in previous research,
3. after retrieving information about companies, 270 subjects were suitable for sending questionnaires.

Between 1997, when the first research was conducted, and 2003, some changes in the market environment have happened resulting in 244 companies in the final sample. Number of collected questionnaires, after five waves of telephone calls, was 112 and that represents 45.9% response rate. This response rate is a result of consistent efforts to obtain answers from rather small population.

The structure of the sample is the following: according to company core business we have 74.55% manufacturing, 10% trade, 14.55% services companies and less than 1% other industries. Analyzed companies mostly sell products to endconsumers and intermediaries (55.14%), followed by 25.23% companies that sell only to endconsumers and 19.63% companies that sell to intermediaries.

Average annual growth in profits for last 3 years from 1-5% has 36.08% companies, followed by 24.74% companies with less than 1% growth. As percentage of average annual growth is rising, number of companies with that growth is decreasing.

No sales from new products introduced in the last five years or no response accounted to 34.82% of companies. For 1-10% sales from new products, we have 21.43% companies. It is interesting that in 6.25% companies, 71-80% sales are attributed to new products introduced in last 5 years.

In the last five years, 39.64% of companies have 1-10% employees participated in training programs and seminars for job skill development. It is interesting that 24.32% companies never sent its employees to any kind of training programs. As percentage of employees participated in training programs and seminars in company are rising, number of companies in the category is decreasing.

4.2. Hypothesis testing

Among Croatian companies, there are different dimensions of customer orientation present.

Multivariate factor analysis was used for testing stated hypothesis. We used principal axis factoring, rotation method Oblimin with Kaiser Normalization and extracted factors by Scree plot and Kaiser-Gutman criterion. Maintained four factors explain 50.5% variance of analyzed scale.

Analyzed sample isolates four factors. Also measures of sampling adequacy (KMO coefficient greater than 0.7) and test of Sphericity are satisfied. Although sample consists of 112 companies, only 90 answered questions for all analyzed variables. With 18 variables grouped into four factors, the condition for ratio between the number of subjects and number of analyzed variables is satisfied.

In factor matrix, factor saturations are arranged by magnitude and those under 0.3 are left out in order to get better matrix clearness as well as to easier separate portions of the same factor. Table 1 represents factor analsyis results for customer orientation subscales.

Although two factors have high saturations on only three portions, (manifested measures of customer orientation) Cronbach's alpha reliability analysis allows further statistical analysis.

Correlation analysis reveals high and statistically significant ($p < 0.01$) correlation between four factors (Table 2).

Table 1. Factor analysis results for customer orientation subscales

	Factor			
	Concern for customer satisfaction	**Monitoring market environment changes**	**Application of market research**	**Responses to information gathered**
first to change with customer changes	,667			
measure customer satisfaction to modify products/services	,655			
respond immediately to competitor offerings	,654			
use customer complaint system to change product/services	,512			
significant changes in products	,430			
customer satisfaction used to evaluate managers performance	,406			,370
customers evaluate quality of products/services	,374			
rapidly detect customer changes in the environment		-,813		
rapidly detect changes in customer preferences		-,653		
evaluate changes in the environment that effect customers		-,541		
apply in-house markt research			,738	
4P's rely heavily on customers surveys			,524	
use Internet to collect information about potential customers			,454	
meet customers once a year to find future needs			,419	
set customer satisfaction goals per each period			,347	
distributing customer satisfaction information through company				,723
reinvest profits in product development				,652
big changes customer/market known in short time				,528
Eigenvalue	6,439	1,074	,915	,654
% of variance explained	35,774	5,965	5,082	3,633

Extraction method: Principal Axis Factoring. Rotation method: Oblimin with Kaiser Normalization. Rotation converged in 12 iterations.

Table 2. Descriptive data, reliability and correlations among customer orientation scales

	M	**σ**	**α**	**Concern for customer satisfaction**	**Monitoring market environment changes**	**Application of market research**	**Responses to information gathered**
Concern for customer satisfaction	24,47	5,766	0,8204	1			
Monitoring market environment changes	10,89	2,773	0,7775	,592**	1		
Application of market research	15,94	4,754	0,7706	,598**	,546**	1	
Responses to information gathered	11,20	2,901	0,7515	,559**	,413**	,511**	1

N=94 to 102; ** $p<0.01$ for all correlations

Business results are associated with customer orientation implementation.

Table 3. Customer orientation dimensions and companies with different average profit growth in last three years

	Average annual profit growth in last 3 years			
	less than 1%	**1-5%**	**6 and more %**	**ANOVA**
Concern for customer satisfaction	21,20	24,57	27,05	$F(2,84)=8,555**$
Monitoring market environment changes	9,86	10,55	12,18	$F(2,83)=6,081**$
Application of market research	13,19	15,90	17,83	$F(2,84)=6,630**$
Responses to information gathered	10,27	11,58	12,06	$F(2,85)=3,284*$

** $p<0.01$; * $p<0.05$

ANOVA results show that companies with low (less than 1%), middle (1-5%) and high (6 and more %) average annual profit growth in last three years statistically significant differ in concern for customer satisfaction. Companies that are slightly concerned about customer satisfaction have low average annual profit growth in the last three years. Companies that are somehow concerned about customer satisfaction reach middle average annual profit growth, and companies are that adequately concerned about customer satisfaction have high average annual profit growth in last three years. Bonferroni post hoc multiple comparison tests found that companies with low average annual profit growth are significantly less concerned about customer satisfaction than companies with high average annual profit growth that are adequately concerned about customer satisfaction. Companies that are somehow concerned about customer satisfaction do not statistically significant differ from companies that are slightly or adequately concerned about customer satisfaction.

ANOVA results further show that companies with low (less than 1%), middle (1-5%) and high (6 and more %) average annual profit growth in last three years significantly differ in monitoring market environment changes. Companies that slightly monitor market environment changes have low average annual profit growth in last three years, companies that somehow monitor market environment changes, have middle average annual profit

growth, and companies that adequately monitor market environment changes have high average annual profit growth in last three years. Bonferroni post hoc multiple comparison test found that companies with low and middle average annual profit growth are significantly less concerned about monitoring market environment changes than companies with high profit growth that adequately monitor market environment changes.

ANOVA results show that companies with low (less than 1%), middle (1-5%) and high (6 and more %) average annual profit growth in last three years significantly differ in application of market research. Companies that less often apply market research have low average annual profit growth in last three years, companies that from time to time apply market research have middle average annual profit growth, and companies that frequently apply market research have high average annual profit growth in last three years. Bonferroni post hoc multiple comparison test found that companies with low average annual profit growth apply market research significant less often than companies with high profit growth that frequently apply market research. Companies that from time to time apply market research do not differ significantly from companies that frequently or less often apply market research.

ANOVA results show that companies with low (less than 1%), middle (1-5%) and high (6 and more %) average annual profit growth in last three years statistically significant differ in responses to information gathered. Companies that slightly respond to information gathered have low average annual profit growth in last three years, companies that somehow respond to information gathered have middle average annual profit growth, and companies that adequately respond to information gathered have high average annual profit growth in last three years. Bonferroni post hoc multiple comparison test found that companies with low average annual profit growth respond significantly less to information gathered than companies with high profit growth that adequately respond to information gathered. Companies that somehow respond to information gathered do not differ significantly from companies that slightly or ones that adequately respond to information gathered.

5. RESEARCH IMPLICATIONS

Companies understand that they have to implement the process of collecting customer' knowledge as well as analysis and interpretation of market environment forces that influence customers' needs and wants into their business practice. Customer oriented company will satisfy expressed present and recognize future consumers needs as well as plan future products and services in cooperation with customers. Therefore, companies use collected information for improving business. However, changing customers needs stimulate company to collect information and respond upon them on constant basis (Dulaimi, 2005, p.5). Customer orientation provides superior value customers in order to satisfy them. That is possible only through recognizing customers' value chain that stay more or less stabile during constant changes in customers needs. Finally, customer orientation and its elements have to be strategic oriented in order to develop sustainable competitive advantages.

Field research analysis illustrates that companies in Croatia, when they develop customer orientation, appreciate four factors: concern for customer satisfaction, monitoring market environment changes, application of market research and responses to information gathered.

Taking into consideration theoretical background and other authors research (Deshpande, Farley, Webster, 1993, Slater, Narver, 1994a, Narver, Jacobson, Slater, 1999, Pelham, Wilson, 1999, Wang, Lo, 2003) factors emerged from conducted filed research are the key ones for customer orientation. All this imply that we affirm stated hypothesis "among Croatian companies, there are different dimensions of customer orientation present".

We could verify that factors obtained through field research analysis among Croatian firms confirm existence of orientation to customers.

Field results analysis further indicates that companies that have low average annual profit growth in past three years are significant less concerned about customer satisfaction, less monitor changes in the market environment, less often apply market research and slightly respond to information gathered that companies with high average annual profit growth. Therefore, adequate concern for customer satisfaction, regular market environment changes monitoring, frequent application of market research and response to information gathered are connected to high average annual profit growth.

Accordingly, as customer orientation components are concern for customer satisfaction, monitoring market environment changes, application of market research and responses to information gathered, we can conclude that their implementation increases profit and therefore initiates better business performance. This affirms stated hypothesis that "business results are associated with customer orientation implementation".

We recognize that responses to information gathered, which are important for customer orientation implementation, are statistically significant related to few variables. Established is correlation only with variables of employees' participation in training programs and average annual profit growth in the past three years. While, with variables like percentage of sales from new product/services, core business and cusomter type we did not found statistically significant relations i.e. does not exist statistically significant difference in relations with company's responses to information gathered. These relations need to be additionally researched. We could conclude that companies in Croatia are concerned with customer satisfaction, are monitoring changes in the marketing environment and applying market research however, their responses do not reflect all dimensions of their customer orientation.

We conclude with the following implication: business performance is for a large part of Croatian companies affected by elements of customer orientation and customer satisfaction.

6. CONCLUSION

Customer oriented companies business aim is to develop customer satisfaction through fulfilling their needs and wants. In order to obtain that, companies apply market research and exploit other ways of collecting information about customers' present and unexpressed needs and wants as well as about changes in the environment. We believe that companies that implement customer orientation continuously monitor market environment changes in order to respond upon competitors' efforts as well as to adapt activities to changing customers' needs.

Analyzing some authors' thoughts we conclude that companies develop advantages providing quality products/services, regarding customers, appreciating employees and developing its capabilities as key success determinants. Furthermore, customer is no longer one time transaction; therefore company develops customer relationship management in order to achieve long-run benefits. We comprehend that next phase after developing and satisfying customers is to build and encourage their loyalty.

Customer satisfaction is under four different group of factors influence: needs, wants and expectations, product/service elements, employee satisfaction and company business practice. Through researching customer satisfaction level as well as present and unexpressed customers' needs and wants, company collects information and creates conditions for developing customer satisfaction. To provide superior value for customers', company collects information about them through market research as well as through relationships. Moreover, collected information is stored in customer knowledge database and used in appropriate way to encourage customer satisfaction.

Conducted research recognized that four factors determine customer orientation in Croatian companies: concern for customer satisfaction, monitoring market environment changes, application of market research and responses to information gathered. Research results indicated that business results recognized as average annual profit growth are associated with customer orientation implementation. The results call for further research of customer orientation in order to better understand the development in these factors and their consequences in company performance.

Key words: *Business ethics, Family enterprises*

1. SUMMARY

At the most basic level a family enterprise may be defined as an enterprise, which is controlled by members of a single family. But family enterprises are not homogenous. They vary in terms of degrees of family involvement. The research cognitions described in the present paper show that 30.9 % of the observed enterprises face strong influence of the families through the ownership as well as management of the enterprise.

The main purpose of our paper is therefore to better understand the association between the degree of involvement of a family in ownership and management of a family enterprise and the business behavior of family enterprise in different business situations. The main data source for our paper is the survey of 350 SMEs in Slovenia.

Overall findings suggest that enterprises, characterized by a high degree of family involvement do not differ significantly from the firms that are characterized as non-family ones, regarding the total sales revenues, economic efficiency, value added per

employee, export orientation and cooperation with large companies. The same goes for firms characterized with a low degree of family involvement. It is very likely, that in the present state of development of family firms and market economy in Slovenia, the degree of family involvement is not crucial for business behavior and business performance regarding the variables analyzed. Several extensions of our research are also proposed.

2. INTRODUCTION

At the most basic level a family enterprise may be defined as an enterprise, which is controlled by members of a single family. Numerous attempts (especially in developed market economies) to define a family enterprise are found in the literature; we pay attention to this issue also in our research carried out in Slovenia. We assume that some characteristics of a family enterprise in transition economy are different from that in developed market economy.

Family enterprises are not homogenous. Empirical researches have revealed that, among others, family enterprises vary regarding the degree of family involvement in ownership and management. Family system forms fundamental principles, values and norms that influence culture and business ethics of a family enterprise. It may be expected, that the degree of this influence varies regarding the degree of family involvement in ownership and management. Business ethics in our paper is understood as the system of norms and rules that had to be followed, especially by the management.

Main purpose of our paper is to better understand the association between the degree of involvement of a family in ownership and management of a family enterprise and the business behavior of family enterprise in different business situations. The main data source for our paper is the survey of 350 SMEs in Slovenia.

The paper is structured as follows: in the third chapter the literature review is presented regarding the importance, characteristics and definitional problems of family businesses in developed market economies as well as in transition countries. In the fourth chapter business ethics in family businesses is discussed. In the fifth chapter hypotheses are formed, while in the sixth chapter data collection and methodology used are presented. After findings in the seventh chapter, conclusions are presented in chapter eight.

3. LITERATURE REVIEW ON FAMILY ENTERPRISES

Although family businesses are no doubtingly considered as a very important part of economies – this holds for developed market economies as well as for transition countries – there is a lack of consensus regarding the definition of a family enterprise. In the literature three main streams regarding this issue may be found (Sharma 2004): articulation of multiple operational definitions of family enterprises (for example:

Westhead and Cowling 1998; Astrachan and Shanker 2003), development of scales to capture various types of family involvement (for example: Astrachan, Klein, and Smyrnios 2002) and the development of family firm typologies (for example, Sharma 2002). The focus of most of these efforts has been on defining family enterprises so they can be distinguished from non–family enterprises. None of these articulations has yet gained widespread acceptance.

However, while differences between family and non–family business have been explored (for example: Jorissen et al. 2005; Westhead and Cowling 1997; Klein 2000), it should be recognised, that family firms are not homogeneous. Empirical research has revealed that family enterprises vary in terms of degrees of family involvement (Westhead and Cowling 1998; Sharma 2004). Three key issues have been frequently utilized when describing family involvement (found in the literature described above): (i) whether a single dominant family group owns more than 50 percent of the shares in a business, (ii) whether the firm is perceived by owners/managers to be a family one and (iii) whether a firm is managed by members drawn from a single dominant family group. These three issues are also used later on in this paper with the purpose to analyse the strength of family involvement into the family business.

At the heart of this issue is whether family business entrepreneurs will place family concerns over business success or growth. Ward (1987) contends that they differ with respect to their inclination to pursue a business-first or a family–first philosophy. Dunn (1995) formed a model to analyse and categorize family enterprises. The model provides insight into the source and effect of family values and family dynamics on business growth and development. Although the sample used in the research was very limited, it could be estimated that business–first firms were more likely to possess the attributes needed for growth. Similarly, Singer and Donahu (1992) identified two distinct types of family businesses: the family–centred business, where the business is the way of life, and the business–centred family, in which business is a means of livelihood.

Ward (1987) suggests that family–oriented enterprises will be rather rigid and will centralise decision making, with family members taking the most important decisions. Donckels and Froehlich (1991) claim that such enterprises will be more stable than progressive and more conservative about growth. While Hoy and Verser (1994) point out that strategic planning in family firms is complicated by the overlapping needs of family, management and owners, Ward (1987) stresses that, since planning is associated with change and risk–taking, family–oriented firms will also fail to make strategic plans.

Moreover, it is very likely that family dynamics change over time. In the first generation, the owner will probably also be the founder, issues of survival and growth will dominate business decisions and family involvement may be rather limited. As the enterprise matures, the family may turn its attention to support increasing number of siblings in a business (Gersick et al. 1997), and enterprises may focus on family objectives to a greater extent than previously (Dyer and Handler 1994). There is some evidence, for example, that first generation enterprises in the UK are less pro–family than subsequent generations (Cromie et al. 1995).

656

Regarding studies on family enterprises performance and their comparisons with non-family enterprises Westhead and Cowling (1997) call attention to the fact that there is little consensus about the "best" indicator to accurately capture the performance of small and medium-sized enterprises among which family ones prevail. Research studies on family enterprises performance have very often focused on a single measure and many studies also have unrealistically assumed that profit maximization is the only (or prime) objective of family enterprises. The authors found in their study that family enterprises are not solely profit maximizers. To a greater extent, respondents in family enterprises suggested "a prime objective is to maintain/enhance the lifestyle of the owners" and "to provide employment for family members in the management team". As a result, in some family companies there is potential conflict between financial and non-financial objectives. Westhead and Cowling (1997) point out, that the performance and wider social contribution of family businesses cannot be assessed by "hard" financial performance indicators alone. Gallo in coauthors (2004) discover in comparative study of Spanish family and non-family enterprises that peculiarities of the "financial logic of family enterprises" are not due to any lack of knowledge or technical financial skills but to the personal preferences of family businesses chief financial officer or other powerful family members. Non-financial objectives very often cited are among others (Westhead, Cowling, 1997; Gallo et al., 2004): "the wish to pass over the business to the next family generation", "offering job opportunities to family members", "to ensure independent ownership of the business", "to maintain the financial independence of the family as well as of the business", "generated profit should remain in the business in order to secure the survival of the business".

In former socialist (communist) countries the research of family businesses is still in its infancy. Studies of family enterprises are scarce. One of the reasons is the fact, that private enterprises were outlawed during the era of a socialist economy. The social and economic changes in the Eastern Europe in the 1990s have created an opportunity for the rebirth of entrepreneurship and family business development. The industrial policy in transition countries has been focused on the development of a dynamic small and medium-sized enterprise sector. Several studies found that families provided critical resources and support to newly emerging enterprises in transition countries (McKibbin, Pistrui, 1997; Poutziouris, O'Sullivan and Nicolescu, 1997; Duh, 2003). Even though earlier studies indicated that family businesses and owner-managed enterprises were at the forefront of socioeconomic transition in these countries, our understanding of the role of family businesses development is scarce. Very little is known about how family enterprises in transition countries are coping with their problems, for example with the succession problem, even though according to experience from established market economies it shall become a serious problem. Namely, owners/managers of family SMEs are often also their founders and are facing the absence of succession tradition. The institutional advisory and educational support is often absent as well.

Slovenia and Croatia became independent states after the collapse of the Socialist Federal Republic of Yugoslavia in 1990. They had similar government institutions, as well as the same legal and economic system. Slovenia, the country with only two million people, has entered European Union in May 2004, and is among the most advance of all transition economies in Central and Eastern Europe.

657

In Croatia, as in other transition economies, the SMEs sector started to develop with the possible prospect of establishing private enterprises. This happened at the beginning of the 1990s, and since then the share of small enterprises has increased by 370 percent. Many of these small enterprises are family ones, even though there are also medium and large family enterprises (Galetić 2002). Family enterprises have been recognized to have an important role in creating new jobs (Aksentijević and Bogović, 2001).

The transition to the market economy from the former socialist economy with social and state ownership in Slovenia was closely associated with the development of SMEs – similarly to the other transition countries. The legal bases for the development of private SMEs were the Law on Enterprises (1988) and the Law on Craft (1988). The first law opened opportunities for the development of the private entrepreneurial sector, and the second law reduced obstacles for the development of the craft sector, especially limitations on employment in craft enterprises. Since the 1990s the number of SMEs increased dramatically; in 2002, the share of SMEs in the structure of all enterprises was 99.7 percent; 93.4 percent of all enterprises were micro enterprises, with up to nine employees (Rebernik et al. 2004). Based on results of two studies on family enterprises (Duh, 2003; Vadnjal, 2005), it was estimated that between 40 and 50 per cent of all enterprises in Slovenia were family ones, majority of them were owned by first-generation owners.

Regarding the appropriate and operational definition of a family enterprise in transition countries, some research results (Duh, Tominc 2005) indicate that some special features of enterprises as well as the economic system should be taken into account. Namely, "ownership remaining within the family's second and later generations" is recognized as one of main elements that characterized family enterprise in developed market economies (Getz, Carlsen, 2000). Therefore the generational criterion ("the enterprise is owned by second-generation or more family members") eliminates enterprises in the ownership of the first generation of owners (founding generation) from the group of family enterprises. The share of first generation family enterprises is very high in transition countries, since the entrepreneurial tradition in transition countries was broken after World War II, and the possibility of establishing private enterprises was opened in the early 1990s. The use of this criterion in the definition of a family enterprise in transition countries would eliminate a very important part of family enterprises from the research.

4. BUSINESS ETHICS IN FAMILY BUSINESSES

The authors who focus on the problems of business ethics distinguish themselves primarily in their understanding of the fundamental instrument (and level) which would guide enterprises to their credible functioning as well as towards the awareness of such functioning as being the fundamental and only possible way for their success (Belak 2005). As Thommen (2004) claims, the credibility of an enterprise is the foundation and origin of enterprises' ethical behavior as well as their success. Further more different authors (Thommen 2003; Belak 2003) define ethics as one of the most

important and equivalent success factors.

The family enterprise consists of two systems with different goals and functional motives which may be the origin of many conflicts. As such these conflicts can be found only in the system of a family enterprise. Several authors (Friz 2002; Duh 2003; Feldbauer 2003; Kadocsa 2003, Klein 2000; Martin 2003) claim that many family enterprises experience crises or even go bankrupt because of the conflicts that family members face as being part of the family on one side and enterprise's stakeholders on the other. Despite the differences between these systems, several entrepreneurs think of "family ownership" as a business instrument and symbol of quality.

The family system is internally oriented (Duh, 2003; Kajzer, 1994), which decreases the possibility of change. Results of the STRATOS project (Donckels and Froehlich 1991), a comparative study of 1132 small and medium sized family and non-family enterprises, showed that the owners of family enterprises expressed the strong opinion that the management of their enterprises should remain in the hands of the family, the family tradition should be preserved, the enterprise should be managed as a family enterprise, and that the main goal should be the building and development of the enterprise in favour of the family interest.

On the other hand the system of an enterprise is based on economic motives, efficiency, and effectiveness. Its behavior is conscious and externally oriented – it strives for changes and uses these changes for its own growth and development.

The family is an intimate room where the culture of the family as well as of the broader environment is shaped, and where the first social relationships are formed, which differ from relationships with people outside the family circle. The process of family education and upbringing form the foundation for the focused expectations of every single family member upon which the trust and firmness of family relations are built. Furthermore the working motivation of family members is different. Considering these facts, we can say that the primary goal of a family enterprise is functional independence as a system. All these characteristics enable a family enterprise to maintain the economic power, development, respect and contentment of its stakeholders (Bogod, Leach, 1999). The motive for functioning is what distinguishes a family enterprise from a non-family one. The family enterprise can achieve all the goals listed above only in the context of its needs and interests which are the consequence of certain phenomenon valuation (values).

The family system forms fundamental principles, values, and norms, which can be seen as the guidelines in setting the vision, mission and goals of such an enterprise. Because of the importance of family influence on the culture and ethics of a family enterprise system, it could be possible to observe and value the level of family influence on the ethics of a family enterprise. The ethical behavior of a family enterprise can be observed through its behavior towards the internal and external business environment. The ethical norms and behavior of an enterprise with family ownership and management (in most cases) derives from family ethical norms and behavior. We should look for the origin of family enterprise credibility by observing a family. The functioning of a certain family enterprise follows the credibility (considering Thommen's concept of credibility 2003), which is based on the communicative, innovative and responsible functioning of that family. In this way

family credibility is not only the origin of business credibility but also the foundation of the enterprise's existence and success.

5. HYPOTHESES

As already mentioned, the main purpose of our paper is to better understand the association between the degree of involvement of a family in ownership and management of a family enterprise and the business behaviour of a family enterprise in different business situations. With the purpose to encounter different levels of family involvement into the business and therefore also into the business decisions, three levels are analyzed:

1   The lowest degree of involvement is expected if owner/manger confirms only that the enterprise is perceived by her/him to be a family enterprise.

2   The middle degree of involvement is expected if owner/manager confirms, that the enterprise is perceived by her/him to be a family enterprise and that more than 50 percent of ordinary voting shares are owned by members of the largest single family group related by blood or marriage.

3   The high degree of involvement is expected if owner/manager confirms, that the enterprise is perceived by her/him to be a family enterprise and that more than 50 percent of ordinary voting shares are owned by members of the largest single family group related by blood or marriage and that one or more of the management team is drawn from the largest family group that owns the enterprise. Alternatively the high degree of involvement was expected also if the third condition is replaced by the condition, that more than 50 percent of the management team is drawn from the largest family group that owns the enterprise.

There is some evidence in the literature, as described earlier, that it may be expected, that family firms characterized by a high degree of family involvement differ from other firms regarding different aspects of business performance and decisions, while family firms characterized by a low level of family involvement do not (»other firms« are firms, that are not characterized by any level of family involvement – non-family firms). Although there is also some evidence, described earlier in this chapter as well, that not solely the level of family involvement matters (for example also the generation of the family in charge), following two main research hypotheses are formed:

H1: Family firms characterized by a high degree of family involvement significantly differ from other firms regarding different aspects of business performance and decisions.

H2: Family firms characterized by a low degree of family involvement do not significantly differ from other firms regarding different aspects of business performance and decisions.

6. DATA AND METHODOLOGY

The main data source for our study is a telephone survey among 350 SMEs in Slovenia. The survey took place in October 2004 in Slovenia. Respondents were owners of enterprises that they also helped to manage. The structure of the sample matched the most recent official data regarding the number of enterprises in regions in Slovenia, as well as the structure of enterprises by their principal industry activity (NACE codes) and by size measured by the number of employees.

Since 12 respondents did not answer all the questions referring to the characteristics of a family business, they were excluded from the analysis. In the next phase of collecting data we were looking for data on company performance. Those data were obtained from the database iBON 2004/II CREDIT RATING where financial statements of companies are collected and stored. We could obtain data for 317 enterprises out of 338 in the sample. Consequently, 317 enterprises remain in the data set. As described in a previous chapter, three levels of family involvement in an enterprise were analyzed and compared with the group of non-family firms.

As previously pointed out, business decisions in family firms may be oriented towards different business goals as they are in non-family businesses, since personal preferences of powerful family members may be differently – financially or non-financially oriented. The present level of research allows us to study only few "quantitative" results of business decisions, namely financial performance:

- Total sales revenues (in €).

- Economic efficiency (in percent) (measured as total revenues to total expenses).

- Added value per employee (in €). The values of these three variables were obtained from the database iBON 2004/II CREDIT RATING.

- Export orientation was measured with the following question: How many (jn share) of your clients live outside Slovenia?

Besides these variables an important aspect regarding the feeling of being independent in business decisions is the cooperation with large companies:

- Respondents were asked, if they cooperate on a permanent basis with large companies with 250 or more employees, rather than just buying their products or services. If they confirmed that they did not cooperate, respondents were asked if they agreed, that they did not cooperate because this could threaten the independent business decisions making of the business that they owned and managed.

For testing the differences between the two groups of enterprises, the t-test and $\chi 2$-test were used. The general criteria for accepting the hypothesis that differences exist was the statistical signification at the 5 percent level ($p < 0.05$; two-tailed).

Different research reports indicate that enterprise demographics can overwhelm univariate studies and performance differences previously detected between family and non family enterprises may simply reflect »sample« rather than »real« performance differences (Westhead and Cowling 1997, Jorissen et al., 2005). As demographic control variables company size and company age were chosen:

- Size of a company. It was measured by the number of employees. Data were obtained from the database iBON 2004/II CREDIT RATING.

- Age of a company. It was measured with the following question: What was the first year the owners received wages, profits or payments in kind? (Payments in kind refer to goods or services provided as payments for work rather than cash.) 50 enterprises out of total 317 in the sample did not answer this question.

7. FINDINGS

7.1. The degree of family involvement in an enterprise

As already mentioned three degrees of the family involvement in an enterprise are observed:
- The lowest degree is observed if respondent – owner/manger – confirms only that the enterprise is perceived by her/him to be a family enterprise – **group A**.

- The middle degree is observed if respondent – owner/manager – confirms, that the enterprise is perceived by her/him to be a family enterprise ***and*** that more than 50 percent of ordinary voting shares are owned by members of the largest single family group related by blood or marriage – **group B**.

- The high degree of influence was expected if: respondent – owner/manager – confirms, that the enterprise is perceived by her/him to be a family enterprise ***and*** that more than 50 percent of ordinary voting shares are owned by members of the largest single family group related by blood or marriage ***and*** that *one or more of the management team* is drawn from the largest family group that owns the enterprise – **group C**. Alternatively the high degree of influence is expected also if the third condition is replaced by the condition, that *more than 50 percent of the management team* is drawn from the largest family group that owns the enterprise – **group D**.

- Other firms were characterized as non-family firms and were included into the **group NF**.

As it is presented in Table 1, there are only few differences between groups A, B in C. Almost all of N=168 firms, that belong to group A, are included also to group B (N=153) and also to group C (N=150), meaning that almost all of those respondents (owners/managers) that perceived firms as a family ones also belonged to the family

that owned more than 50 percent of ordinary voting shares; at the same time *one or more of the management team* is drawn from the largest family group that owns the enterprise.

Therefore only two levels of family involvement were included into the further analysis: group A in comparison with the group NF and group D in comparison with the group NF.

Table 1: The number and the share of enterprises regarding different levels of family involvement

Group	Number	Sample proportion in percent	95% confidence interval
A	168	53.0	(47.5; 58.5)
B	153	48.3	(42,7; 53.8)
C	150	47.3	(41.8; 52.8)
D	98	30.9	(25.8; 36.0)
NF	149	47.0	(41.5; 52.5)

7.2. Employment size and age

Research results on company size measured by the number of employees show that there are no significant differences between firms, that are perceived by owner/manager to be family ones and those that are not – groups A and NF, as presented in Table 2. Similarly, there are no significant differences between enterprises included in groups D and NF.

Table 2: Employment size and age of enterprises

Group	Employment size			Age		
	Value	t-statistics	p-value	Value	t-statistics	p-value
A	4.77	1.162 (A and NF)	0.246	11.31	1.773 (A and NF)	0.077
NF	3.41			9.56		
D	4.38	0.699 (D and NF)	0.485	12.41	2.454 (D and NF)	0.030

As already mentioned, age of a company was measured with the following question: *What was the first year the owners received wages, profits or payments in kind?* Enterprises that are characterized by a certain level of family involvement - groups A and group D - are on average older than enterprises in the group NF. The difference between group D and NF regarding the age of a company is also significant.

Even though family enterprises in Slovenia are on average older than non family ones, they are relatively young comparing to family enterprises in some other countries. For example, German family businesses are older than non family businesses and older than Slovenian ones. Of the businesses that were founded up to 1960 and were still around in 1996-97, more than 70 percent are still family businesses (Klein, 2000). On the other hand, Pistrui and coauthors (2000) found in comparative study between East and West German SMEs that the vast majority (79 percent) of the East German enterprises surveyed were new start-ups, compared to 38 percent in the West.

7.3. Business performance

As already mentioned, the business performance was analyzed:

- Total sales revenues (in €).
- Economic efficiency (in percent) (measured as total revenues to total expenses).
- Added value per employee (in €). The values of these three variables were obtained from the database iBON 2004/II CREDIT RATING

Export orientation was also analyzed – by the share of customers living outside Slovenia. Proportions of firms with more than 50 percent of customers living abroad in both groups were analyzed. Results are reported in Table 3.

Table 3: Total sales revenues, economic efficiency and added value per employee

Group	A	NF	D
Total sales revenue (in €)	408,476.9	141,082.4	444,615.8
$\quad$ t = 1.993 $\quad$ p = 0.089 (A and NF)			
$\quad$ t = 1.419 $\quad$ p = 0.159 (D and NF)			
Economic efficiency (in %)	106.4	126.4	104.9
$\quad$ t = -2.658 $\quad$ p = 0.009 (A and NF)			
$\quad$ t = -2.766 $\quad$ p = 0.006 (D and NF)			
Added value per employee (in €)	14,232.3	8,868.8	16,021.5
$\quad$ t = 1.328 $\quad$ p = 0.185 (A and NF)			
$\quad$ t = 1.144 $\quad$ p = 0.255 (D and NF)			
Proportion of firms with more than 50 percent of customers living abroad (in %)	10.7	9.4	7.1
$\quad$ $\chi2 = 0.04$ $\quad$ p = 0.840 (A and NF)			
$\quad$ $\chi2 = 0.151$ $\quad$ p = 0.535 (D and NF)			

In both cases results are similar, namely, groups A and D significantly differ from NF group only regarding the economic efficiency. There is no evidence, that the financial performance of firms with stronger family involvement (group D) is different than in firms where the family involvement is less strong (group A).

7.4. Cooperation with large companies

As results presented in Table 5 indicate, a higher proportion of firms that are perceived as family ones by the owner/manager (group A), cooperate with large companies, than it is found among firms, that are characterized as non-family ones.

The difference in proportions of companies that cooperate with large companies in groups D and NF is significant at p<0.10. On the other hand, the proportions of those that do not cooperate because this could threaten the independent business decisions making of the business that they own and manage, are not significantly different – between groups A and NF as well as groups D and NF. Nevertheless it is worth stressing that this reason is important for almost one quarter or firms that do not cooperate with large companies.

Table 5: Cooperation with large companies

Group	Percentage of companies, that cooperate with large companies			Percentage of those that do not cooperate, because this would threaten their business independency		
	Value	χ2-statistics	p-value	Value	χ2-statistics	p-value
A	45.2 (A and NF)	8.350	0.004	22.0 (A and NF)	0.056	0.813
NF	28.9			24.5		
D	39.8 (D and NF)	2.714	0.099	20.7 (D and NF)	0.121	0.728

Overall findings suggest that hypothesis H1 is rejected and hypothesis H2 is not rejected. Therefore it seems, that enterprises, characterized by a high degree of family involvement do not differ significantly from the firms that are characterized as non-family ones, regarding the total sales revenues, economic efficiency, added value per employee, export orientation and cooperation with large companies. The same goes for firms characterized with a low degree of family involvement.

8. CONCLUAIONS

It is very likely, that in the present state of development of family firms and market economy in Slovenia, the degree of family involvement is not crucial for business behavior and business performance regarding the variables analyzed. As already mentioned, in the first generation firms, issues of survival and growth may dominate business decisions and family involvement may be rather limited. As the enterprise matures, the family may turn its attention to support increasing number of siblings in a business (Gersick et al. 1997), and enterprises may focus on family objectives to a greater extent than previously (Dyer and Handler 1994). Since the majority of firms in groups A and D are the first (the founder) generation firms (83.7 percent in group A and 87.8 percent in group D), this may also be among reasons for no significant differences regarding analyzed business performance indicators, between firms, that are characterized by a certain level of family involvement and the firms that are not.

It was also established (Duh et al. 2007) that family and non-family firms (different levels of family involvement were analyzed) do not differ significantly regarding aspirations of entrepreneurs to grow their businesses, neither are the succession issues of great concern of entrepreneurs in Slovenian family businesses. It therefore seems that there are no significant differences between family and non-family firms regarding many issues in Slovenia.

Several extensions of our research are needed and possible; one being the analysis of impact of a generation of a family that is in charge, on the strength of family influences on the business behavior, as well as other factor that might influence business decisions in family businesses. Since the proportion of family businesses that are owned and managed by a second generation or more is rather small in Slovenia, their identification is not an easy task.

The present level of research allows us to study only few "quantitative" results of business decisions. As it was already mentioned in this paper, the performance of

family businesses cannot be assessed by "hard" financial performance indicators alone – non-financial objectives, like "the wish to pass over the business to the next family generation", "offering job opportunities to family members", "to ensure independent ownership of the business", "to maintain the financial independence of the family as well as of the business", "generated profit should remain in the business in order to secure the survival of the business", may be of a greater importance in a family business. Therefore the extension of our research should also go in this direction.

From ethics perspective the research should strongly consider a family enterprise as two different systems that influence each other. The research cognitions described in the present paper show that 30.9 % of the observed enterprises face strong influence of the families through the ownership as well as management of the enterprise. Considering our previous discussion we could claim that norms and values shaped and formed within a family system would be overtaken also by an enterprise system, where a family has strong impact on the vision, mission and the goals of an enterprise. Considering the characteristics of the both family and enterprise systems we can state further research questions: Are the family enterprises less risk taking as non-family enterprises? Are family enterprises more ethically oriented as non-family ones? Are family enterprises more successful from non-family ones in long term? In order to answer these questions further research should observe separately core values, culture, philosophy, and ethics of a family as well as of an enterprise. This research approach would also show the influence that family has on an enterprise in a sense of non-financial or qualitative elements of family enterprises' success.

Employee suggestion systems, innovation management,
Manufacturing

1. INTRODUCTION

This article shows the development of a performance measurement model for idea management. Idea management (IM) is a formalized mechanism for encouraging employees to contribute constructive ideas in order to improve organisations in which they are employed (Milner et al., 1995). It encompasses planning, organising, managing and control of the process of inventions creation and their transformation into potential innovations and further into innovations in the widest range of employees – unprofessional innovators. Idea management can not be a way to a rapid progress of the company yet it may importantly influence its competitiveness by its contribution to the continuous improvement of processes. Beside that, it may also indicate the starting point of successful "professional" innovation, i.e. the product, service or process development that provides the basis for company's survival and its main competitive advantage.

Two basic organizational forms of IM can be identified in the organizations producing goods or services. The "classical" centrally-driven system provides for the entire process to be managed in a centralised manner. The employees submit their ideas on improvements (i.e. suggestions) in a written form to the central department (IM department) or an individual who is responsible for processing employee suggestions within the company. The role of a line manager in this system is only marginal. On the other hand, the supervisors-managed system proves to be completely decentralized since the predominant responsibility for implementing IM is entrusted to line managers. The IM department acts only as a coordinator, trainer, animator and motivator. Besides the two basic approaches to IM, also different combinations of both can be found.

An increasing role of IM can be noticed in the business practice (Dib-Report, 2005). A number of companies state the importance of non-professional innovations as a way to competitive advantage. However, it can be noticed that the companies are missing a reference point to assess if their achievements are good, even exceptional or perhaps just on average. Two commonly used measures are the number of (submitted and implemented) suggestions and net economic savings from suggestions (both relative to the total number of employees).

Even though these two measures may show the degree of effectiveness of the IM system in comparison to other organisations, they don't allow an in-depth comparison and assessment of the current (favourable or unfavourable) situation. In order to assess the effectiveness of the invention and innovation processes in a company, their efficiency and effectiveness should be measured in a more objective way than by number of suggestions and net savings only.

2. THEORETICAL BACKGROUND

Radical changes in the business environment, like new technological opportunities, world trade liberalization, shortening of product life cycles and shareholders' increasing attention to short-term profitability force the today's organizations into continuous striving for adaptation. Along with other business areas, also the invention and innovation management is forced into continuous demonstration of improved development behaviour, not only by using invested funds efficiently, but also by its own development (Lager, Horte, 2002). For this reason, the organisations need to observe their environment actively, thus making the measurement of their abilities in comparison to the business environment an increasingly important task on every manager's agenda. However, the efforts to define the appropriate IM performance indicators are facing a number of obstacles. Several studies on professional invention-innovation processes and structures have been carried out on the company, industry and country level, but rather a limited number of them on idea management. So, the IM performance indicators are grounded mainly on practical experience of every single organisation.

Since the professional innovation and IM are closely related and interdependent, we can assume that the performance of both can at least partly be measured in a similar way. Literature asserts numerous definitions of indicators which would enable assessing of the organization's innovation capability. Innovation indicators may be observed in several ways. The first alternative for a division is performed according to the phase of their influence on invention-innovation processes, i.e. the process *input*, the *process* itself and the process *output* (e.g. Flor, Oltra, 2004). Next possible division encompasses individual and composite indicators. *Individual* indicators (e.g. Hollenstein, 1996; Coombs et. al., 1996; Freel, 2005) measure single influential factors (e.g. amount of resources invested into research and development, annual number of days dedicated to training of management and employees and similar). The problem of individual indicators remains their inability to analyse objectively such a complex area as the innovation management most definitely is. Consequently, the *composite* indicators prove to be more appropriate since they regard the invention-innovation process with due complexity, namely as an intertwinement of related and correlated factors (e.g. Hagedoorn and Cloodt, 2003).

A deficiency of past research in the field of idea management is its focus on individual indicators of effectiveness and efficiency (e.g. Thom, Etienne, 1997; Marx, 1995) which are only rarely aggregated into composite ones (one of the most recent of the latter is GiMB, 2004). The proposed methodology tries to overcome this restraint.

3.   METHODOLOGY

The aim of our research was to define a methodology for IM performance measurement which will assure the fulfilment of the following objectives:

1. a quantitative assessment of IM performance (a quick evaluation of every influential factor (organizational structure, climate and culture, goal setting, IM processes ...), an ability to compare the state of development for every factor within the company and an aggregated score for all the factors per company),

2. a comparison among companies at the level of every influential factor and in general, and

3. an intuitive graphical presentation of results.

The research is based on an extensive questionnaire, composed of a qualitative and quantitative section (the questionnaire development is discussed in detail in chapters 3.1 and 3.2).

In the qualitative section, the IM characteristics of the company are determined on the basis of the statements, evaluated by the respondent on the 5-grade Likert scale. The input and process parameters are evaluated separately. In the quantitative section, the company's results in the field of IM (i.e. output parameters) are determined. The principal difference among input and process parameters on one side and the output parameters on another is that input and process parameters can be influenced directly by the management, while output parameters are controllable only indirectly, by control of input and process. Thus, the company needs to assure such a combination of input and process that the optimal results are achieved in the output. For this reason, input and process parameters will mainly be discussed simultaneously.

A second stage of the survey was a pilot test and analysis of responses. On the basis of determined output parameters, IM performance indicators are calculated. Further, these indicators are compared to the input and process parameters achieved. Our aim is to confirm a relationship between input and process parameters, as defined by our methodology, and results, achieved by the IM in a company.

3.1.   Measuring of input and process parameters

The development process of the questionnaire qualitative section comprised several phases. Based on the literature review on innovation and idea management (Anic, Neuhaus, 2002; Drucker, 1985; Fatur, 2005; Garcia, Prado, 2003; Johannessen et al., 1999; Likar, Kopač, 2005; Lloyd, 1996; Milner et al., 1995; Markič, 2006; Mulej, Ženko, 2002; Pervaiz, 1998; Thom, Etienne, 1997), (1) the elements, influencing the IM performance, and (2) their sense of influence (accelerating or hindering) was identified. The influencing elements were transformed into statements, which establish the presence and the level of influence or development of individual element of IM. We continued with merging statements which are covering similar contents into "factors" (Table 1). Organization of the IM system was thus defined as an intertwinement of 11 qualitative factors, each of them evaluated on the 5-grade Likert scale by 9-18 statements.

Table 1: Input and process parameters of idea management

	Input parameters of IM		Process parameters of IM
In1	IM strategy	Proc1	IM organisation
In2	IM goals and objectives	Proc2	Creativity techniques
In3	Innovation culture and climate	Proc3	IM communication
In4	IM perception	Proc4	IM bonus system
In5	IM training	Proc5	Line managers
		Proc6	Idea manager

Each factor can be defined as an implicit characteristic of IM, while the statements reflect explicit, visible characteristics of IM. From the methodological viewpoint it would be fairly complicated to evaluate the implicit characteristics of culture, leadership, creativity and other IM factors by a questionnaire (a more appropriate technique is the interview or observation, but being quite difficult in view of a relative large sample). Therefore it makes sense to transform the implicit characteristic into statements, determining the nature of particular activities, events, decisions (thus superficially visible – explicit – characteristics) and infer from the statements to prevailing culture, management style or creativity level.

After the elimination of the statements within every factor which duplicate in the meaning, the questionnaire was subject to a double validation process (filled-out at the first stage by 3 IM experts from the same company and at the second stage by an expert from three different companies) to assure the common understanding and prevent the ambiguity of the understanding of each statement.

3.2. Measuring of output parameters

The output parameters (Table 2) express company's results, achievements in the field of IM. In contrast to input and process parameters that can be directly influenced by the company, the output parameters can only be controlled indirectly, by adapting input and process. In order to assess the effectiveness and efficiency of this control, the measures of performance must be established first. While the inputs into IM process and the process itself usually can not be measured quantitatively, the IM results can be expressed by objective indicators. Consequently, a comparison among the set objectives and achieved results can be used as an IM performance measure.

Table 2: Output parameters of idea management

	Output parameters of IM
Out1	Number of submitted suggestions
Out2	Number of employees submitting a suggestion
Out3	Number of approved suggestions
Out4	Number of implemented suggestions
Out5	Net savings from suggestions
Out6	Total awards paid
Out7	Total number of employees

3.3. Calculation of output indicators

In order to be able to compare achievements of different companies, one has to set relative indicators expressing each output parameter in relative terms. The basic presumption within the indicator formulation is the following: a successful IM embraces lots of employees submitting lots of suggestions, lots of them are approved and lots implemented out of these, each bringing a the highest possible savings. If these goals are met, the economic value of IM is assured and investment into its development justified.

Based upon the output parameters (*Out1…7*), a set of 6 indicators has been developed. Some of them are already well known from the literature and business practice (Dib-Report, 2005; GiMB, 2004); some were developed for the purpose of this research. However, they are organized in a logical set of indicators, each of them showing an essential segment of IM. The indicators are explained in detail in the following chapters.

3.3.1. Return ratio (RR)

The economic objective of IM can be expressed as net savings per employee, calculated as a difference between the sum of revenues increase and cost reduction due to suggestion implementation and the sum of costs, caused by the implementation of suggestions and overall IM system development, per employee.

$$RR = \frac{Net\ savings\ from\ suggestions\ (Out5)}{Total\ employees\ (Out7)}$$

Though, there is a considerable part of suggestions that can not be financially evaluated (e.g. improvement of workplace conditions, prevention of mistakes, work safety etc.). The calculation costs for smaller suggestions can even be much higher than the benefit of the suggestion itself (Hierl, 2002). However, recent trends propose a rough estimation of economic value even for these suggestions (GiMB, 2004).

3.3.2. Popularization ratio (PR)

This indicator refers to the area that normally attracts most attention in the stage of IM implementation in a company. It is defined as a share of employees that have submitted at least one suggestion in a 1-year period.

$$PR = \frac{No.\ of\ employees\ submitting\ a\ suggestion\ (Out2)}{Total\ employees\ (Out7)}$$

If the IM should reach an appropriate position in a company, a critical mass of employees needs to be attracted. So, as many employees as possible submitting an idea shall be the primary goal of IM. The indicator measures the company's ability to popularize IM. This depends on a complex set of factors, e.g. a general organizational climate and culture, line managers' behaviour, advertising, communication, bonus system etc.

3.3.3. Customization ratio (CR)

While the Popularization ratio measures a general ability of IM to attract the employees, the Customization ratio is more focused. It measures the action of IM onto a particular inventor.

$$CR = \frac{No.\ of\ submitted\ suggestions\ (Out1)}{No.\ of\ employees\ submitting\ a\ suggestion\ (Out2)}$$

Attracting an employee to submit a suggestion requires one approach, retaining him/her in the system in order that (s)he keeps returning with new ideas needs other measures. A careful

treatment of any suggestion is here of vital importance, including the speed of evaluation, fairness and prompt implementation of approved suggestions.

3.3.4. Focus ratio (FR)

In principle, approved suggestions are the ones that prove to be useful to the company. It might also happen that even useful suggestions are not approved, but a situation like this would show a rather degenerated system. It is also true that approving a suggestion does not necessarily mean its implementation into practice – this will be an issue of the following indicator.

$$FR = \frac{No.\ of\ approved\ suggestions\,(Out3)}{No.\ of\ submitted\ suggestions\,(Out1)}$$

The Focus ratio (the rate of approved suggestions out of all submitted) shows the share of suggestions that were evaluated as beneficial for the company. Beneficial is what contributes to the fulfilment of the company's business goals. Therefore, approved suggestions are the ones contributing to the company goals. In order to make the share of such suggestions as large as possible, the IM system needs to direct the employees towards the areas that need improvement. This is closely connected to setting of IM goals that are "customized" to the particular needs of every organization unit of the company. Therefore, a high Focus ratio indicates the management's ability to focus the employees on the areas which need improvement.

3.3.5. Implementation ratio (IR)

The Implementation ratio indicates the company's ability to implement ideas.

$$IR = \frac{No.\ of\ implemented\ suggestions\,(Out4)}{No.\ of\ approved\ suggestions\,(Out3)}$$

An invention itself has no value unless implemented. For this reason, the Implementation ratio is of a high importance. Usually, implementation of suggestions is out the idea management domain. The IM department evaluates the idea and passes it to the line manager (e.g. maintenance staff) for implementation. Here, lack of interest, time and good will can often be an obstacle. If ideas are not implemented, the effect will soon be noticed as the low Customization ratio level. Therefore, Implementation ratio shows the IM ability to motivate the line managers to put the suggestions into practice (to turn inventions into innovations). The fulfilment of this indicator can not only be the responsibility of IM itself, but the company's ability to coordinate the IM office and the line hierarchy, primarily by goal setting and control of their accomplishment.

3.3.6. Exploitation ratio (ER)

Net savings indicator measures the "weight" of a particular suggestion in terms of its contribution to an increase of revenues or decrease of costs. Thus, it is a measure of every suggestion's quality and an attribute of the suggestion itself (and responsibility of inventor). However, the Exploitation ratio as an average net savings per suggestion and thus the responsibility if IM system.

$$ER = \frac{Net\ savings\ from\ suggestions\,(Out5)}{No.\ of\ implemented\ suggestions\,(Out4)}$$

The evaluation of this indicator requires a certain level of caution. In some companies, the net savings per suggestion are much higher than in the others. This can be a sign of different approaches to IM (e.g. a mass approach with lower savings or production of ideas in

interdisciplinary teams composed predominantly of professionals). So, this indicator must be considered in the context of other indicators (above all the Popularization ratio). A low number of suggestions and low savings per suggestion do not demonstrate a successful IM.

However, irrespective of the IM approach chosen, the goal is to raise this indicator. This means to raise the creativity level, e.g. by systematic employment of creativity techniques, raising the quality of solutions by team work and support quality by an appropriate bonus system which discourages inventors to take suboptimal solutions to problems.

3.4. Questionnaire structure and pilot testing

The questionnaire consists of the introductory part and two sections. In the introduction some basic information on the company have been asked for; company name and address, number of employees, number of blue-collar workers, respondent's personal data and the organizational type of IM.

In the second part input and output parameters of IM have been examined, i.e. the qualitative characteristics of the process. This part is divided into 11 factors; each consisting of 9 to 18 statements. The respondent evaluates each statement and decides for a mark between 1 (not agree) and 5 (completely agree). The possibilities »I do not know« and »Does not relate« are also provided.

The third, quantitative part of the questionnaire investigates the IM results. In order to assess the progress of a separate company in the field of these results, there are questions, related to the achievements for each year within the last three years. Since all the companies do not attend or control (supervise) all the results, the respondents have been asked to answer in the best way they can, i.e. in the case they do not know the date exactly, they form at least an estimate.

On the basis of the validated questionnaire, a pilot study has been carried out in June 2005 on the panel of 50 medium-sized and large companies that employ a total of 53,000 employees which account for approximately 10 % of all people employed in the business sector.

The panel of companies, included in the pilot study, consisted of all the companies which, according to the data of Chamber of Commerce and Industry of Slovenia, are active in the field of IM. The Chamber of Commerce and Industry is the major national association of enterprises, having also the Innovation and Intellectual Property Commission under its own patronage. The Chamber's database has been extensive enough to conclude that all the relevant companies have been included in the study. The sample considered is rather large; however, it does not allow drawing conclusions on the politics in Slovene companies that are not involved in IM. Since the tested panel included 82 % of manufacturing organizations and only 18 % of organizations producing services (which does not correspond to the ratios at the national level), this model may be valid predominantly for manufacturing environment.

Since the topic is rather specific and the answers of the employees with different status in the organization would have been different, it was very important that the questionnaire had been filled-out by a person, who is actually in charge if IM. So, the questionnaires have been sent to personal addresses of the responsible persons.

The questionnaire has not been anonymous; however, it was assured that all the data would be kept confidential and published exclusively in aggregated form.

4. RESULTS

In the qualitative section of the questionnaire, the characteristics of IM in a company were assessed upon the respondent's judgement. Within this, the 5 input parameters In_i and the 6 process parameters $Proc_i$ (as shown in Table 1) of this process were evaluated separately. In the quantitative section, the achieved results of the company in the field of IM, i.e. the output parameters Out_i (as shown in Table 2) were assessed.

On the basis of the pilot study we wanted to verify the existence and nature of relationship between the values of input and process parameters and output results of IM (expressed as performance indicators being calculated from Out_i as shown in Chapter 3.3). For this purpose, each value ($M_{i,j}$) of a factor i for the company j was calculated as arithmetic mean of the values of all the statements, given by the respondent within every factor.

The values $M_{i,j}$ for a company were entered into a radar diagram. In case the single values are similar one to another, hence not indicating any major deviations upwards or downwards, the radar diagram is more symmetrical (a regular circle). Mathematically, this regularity is represented as standard deviation of the values for single factors.

Here a presumption was made that for a company j it is favourable to reach similar values of input and process parameters ($M_{i,j}$), thus a low standard deviation of values $M_{i,j}$ and a rather symmetrical radar diagram.

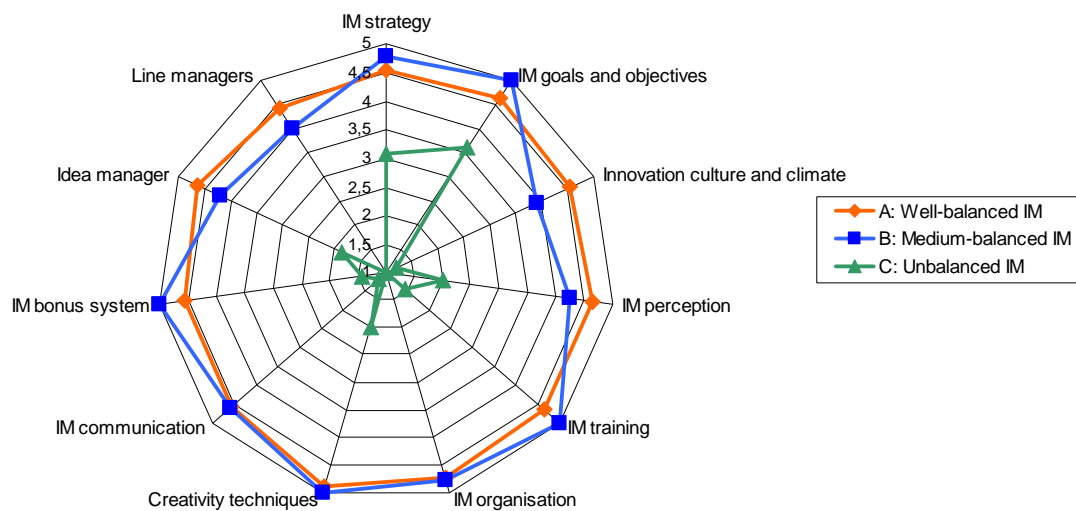
Figure 1 shows the factor's values M_i for 3 companies from both extremes of the sample in consideration – the one with the most balanced IM system (A), the one with the least balanced (C) and an average one (B). For company A, a fairly symmetrical radar diagram can be seen. Besides that, we can graphically establish the highest average values M_i for company A. The opposite holds for company C.


Figure 1: Average values of factors for a company with the most balanced IM system (A), the one with the least balanced (C) and an average one (B)

To verify the presumption that low standard deviation of values M_i implies higher output indicators, the companies were grouped into three equal groups on the basis of their standard deviation of values M_i. Companies in the first group (*well balanced*) reached a standard deviation $SD = 0.28$, second group (*medium balance*) a $SD = 0.42$ and third group

(*unbalanced*) SD = 0.66. For these groups of companies, we wanted to confirm how their input/process value (un)balance affects their IM results. We found out (

Figure *2*) that the economic effect of IM (return ratio RR) for the "well balanced" companies reaches more than six fold higher values of RR than for the "unbalanced". The companies that keep developing their IM in a systematic way earn with their employees' ideas several times more (per employee) than the ones less methodical! Also the other output indicators, not shown here, demonstrate a similar trend.
Figure 2: Relationship between the balance of organizational factors of IM and its return ratio (RR)

As shown above, a balanced management of all the influential factors of IM relates highly positively with the IM performance. An excellent performance in strategy formulation, goal setting or employee training without a well-established communication system or bonus scheme makes the IM system essentially less efficient. The success of IM chain is determined by its weakest link. The analysis confirmed the presumption that the balance of input and process parameters determines the output performance of IM.

5. DISCUSSION

The purpose of our research was a development of performance measurement model for idea management in organizations. For this purpose, a questionnaire examining the inputs to this process, the process itself and its outputs was developed, as well as a set of indicators to evaluate the quality of the output from IM process. The suggested model links the input and process (i.e. directly controllable) parameters of IM with the output (indirectly controllable) parameters. By aggregating the individual performance indicators of IM into composite ones, the proposed methodology overcomes the deficiency of past research in this field.

A pilot study of 50 Slovenian companies active in IM has proved the adequacy of the proposed methodology for a quick evaluation of the IM performance. The study has also shown that a simultaneous, well balanced development of all the input and process subsystems of IM leads to a substantially higher IM performance than a development of single subsystems only. The application of appropriate control measures to the directly controllable parameters may lead to essentially higher output results. Therefore, the pilot

study has shown not only the suitability of the proposed methodology but also some other valuable results.

Some limitations of our research can also be established. Such a complex management field as the IM definitely is can only hardly be investigated in detail by means of a questionnaire, however elaborated it may be. However, the proposed methodology is a trade-off between the profundity of evaluation and ease of use (i.e. simplicity and evaluation speed).

Since the tested panel included 82 % of manufacturing organizations and 18 % of service organizations (which does not correspond to the ratios at the national level), this model may be valid predominantly for manufacturing environment. However, experience shows that IM is much more present in companies producing goods than the ones producing services.

The methodology is limited to organizations having an active IM system as well as established basic measures for its quantitative evaluation. For such organizations, this methodology may represent a tool for a longitudinal assessment of their progress and an inter-organizational benchmarking. For other organizations, the questionnaire may serve as a systematic checklist for determination of the present state and possible measures for its improvement. A partial deficiency of the pilot study is the subjectivity of evaluation made upon responses of only one person (the idea manager) per each organization, in spite of the fact that the questionnaire statements refer mainly to the factors that can be objectively assessed. In any case, the average results at the level of 50 companies are relevant. For an in-depth analysis of a single organization, the questionnaire needs to be filled-out by more than one person and complemented by other methods of qualitative analysis (e.g. semi-structured interview).

Possible extensions to this research may lead in three directions: firstly, towards the in-depth analyses of IM at the level of an organization; secondly, towards the development of a methodology for a quick evaluation of the IM state on the randomly selected sample of organizations; and thirdly, towards an extended comparative research of IM in different national environments with different entrepreneurial and innovation culture.

1. INTRODUCTION

Globalisation, which manifests itself as an increasing market harmonisation - i.e. deregulation and liberalisation of international transfer of goods, services, and factors of production - increases the significance of the company's immediate environment for its market success, a fact which may seem paradoxical. These phenomena escalate business entities' propensity for concentration: firms conducting similar activities concentrate in certain countries, regions or locations (Patel, Pavitt 1991, Amendoa et.al. 1992, Patel, Vega 1999). Among other things, this manifests itself in the creation of clusters. Porter defines clusters as: "geographic concentrations of interconnected companies, specialized suppliers, service providers, firms in related industries (e.g. universities, standards agencies, trade associations) in a particular field that compete but also cooperate (Porter 1998)." That means that all functions of a value chain are distributed and represented by a number of enterprises and other organizations within a region that are linked by commonalities and complementarities.

The discussion of clusters in the economies of countries which have undergone economic and systemic transformation, especially Poland, is rather limited. This is why the present authors attempt to present what has been found so far on the subject of clusters in Poland, with particular emphasis laid on a furniture cluster in the region of Wielkopolska. The discussion starts with a brief review of possible channels of a cluster's influence on the competitiveness of companies-cluster members. Next, using data presented in the literature and professional

press, and the results of their empirical research, the authors describe Wielkopolska's furniture cluster, with special emphasis laid on:

- first, the significance of companies' cluster membership for their competitive potential, in other words, a set of those features of the company which are crucial to the implementation of a given strategy and achievement of a desired position in the market (amongst its rivals) (Competitive gap at the company level 2002).

- second, its significance for the competitive behaviour and competitive position of the companies under study. A company's competitive position can be identified with the competitive strategy it pursues, that is, the adopted way of exploiting its competitive potential in a given environment; it is an effect of having a given level of competitive skills/competence (Competitive gap at the company level 2002).

2. THE INFLUENCE OF A CLUSTER ON THE COMPETITIVENESS OF COMPANIES – CLUSTER MEMBERS

The question of how clusters influence the competitiveness of the companies that constitute it bothers many a researcher. Sources of the competitive advantage of companies which constitute a cluster lie, on the one hand, in their competitive potential, and on the other, in their immediate environment, which is typical of the viewpoint put forward by Porter. A company's activity within a cluster enables it to use both approaches to the building of a competitive advantage, and the cluster itself enhances their complementary character. On the basis of empirical data, Audretsch (1998) and Porter (1998) have demonstrated that a geographical concentration of rivals increases company competitiveness, stimulating innovativeness, company growth and new entries into the cluster.

Table 1 presents those views on a cluster's influence on the competitiveness of its member companies which are most often quoted in the literature. A closer analysis of the advantages of cluster membership suggests that the most common area of a desired influence is company competitive potential. Cluster membership first of all expands, transforms and gives a new quality to elements of company competitive potential; secondly, it determines the character of relational competitive strategies, thus creating a wide field for co-operation with rivals-other cluster members. Therefore, the scope of the cluster's immediate influence concerns two out of three determinants of company competitiveness. The third one – company competitive position – experiences some sort of indirect influence.

Table 1. The main advantages of cluster membership and their connection with the determinants of company competitiveness

Advantages of cluster membership	Interpretation	Determinant of competitiveness
Access to specialised and highly advanced resources, such as key skills and risk capital	Basic, uncomplicated, usually material resources are available through purchases in the global market or through companies' foreign direct investments; specialised resources are usually immobile	Competitive potential
Access to specialised suppliers,	Positive impact on industry	Competitive potential

services, and infrastructure	specialisation, improvement in its effectiveness, stimulating technological spillover	
Access to demanding customers whose needs anticipate changes in the international market	The needs can be identified and responded to earlier; changes in customer needs exert pressure on innovativeness	Competitive strategy
Proximity of market rivals, who fight for industry leadership	Factor which exerts pressure on innovativeness, especially in industries where competition has a non-price character	Competitive strategy
Proximity of innovative related industries, supporting industries, and related institutions	Similarities in technologies, skills, customers, infrastructure, suppliers and functions played have a positive impact on technological spillover.	Competitive potential
Proximity of other intsitutions connected with the cluster	Positive influence on co-operative processes, e.g. proximity enables a better risk management connected with innovations	Competitive strategy

Source: Own study, based on Marshall (1949), Porter (1998), Freeman (1991), Zander, Sölvell (1995).

There seem to be two key ways in which a cluster can influence company competitiveness:

- first, spillover effects observed in the cluster,

- second, relations existing among institutions constituting the cluster.

The other possible channels of influence are a consequence of the relations among companies and of spillover effects.

2.1. Knowledge spillover effects as a symptom of the cluster's influence on company competitiveness

The issue of spillover effects and their relationship with the location factor was raised by Marshall (1949), who indicated that one of the objects of a spillover is knowledge. The problem of knowledge spillover with the consideration of the geographical space factor is also discussed by many contemporary researchers.

Knowledge spillover effects are an inseparable element of a cluster. This spillover can occur even if relations between companies are non-existent. It should be pointed out at this point that in the subject literature we can find two different views on whether relations among companies enhance the influence of spillover effects on company innovativeness and growth. The view represented by Marshall (1949), Arrow (1962) and Romer (1986) is characterised by a positive attitude towards monopoly, which, in their opinion, is conducive to increased innovativeness and growth. Monopoly enables a dominating company to maximise the return on innovations, which is impossible in a competitive environment. On the other hand, Jacobs's (1969) point of view indicates a desirable influence of competiton on innovations and growth. Jacobs's perspective was developed by Porter, who emphasises the significance of local competition for innovativeness and stimulation of knowledge spillover effects. Continuing Jacobs's and Porter's argument, it could be stated that knowledge within a cluster is determined by interrelations among companies operating in the same location (Henry, Pinch 2002). Storper (1993, 1995) similarly explains that the acquisition of knowledge occurs

thanks to relationships among companies which have nothing to do with a market exchange typical of knowledge acquisition through licensing, alliances or takeovers.

Attempts are even made to build a knowledge-based theory of regional geographic clusters (Maskell 2001, Morgan 1997). Maskell (2001) finds the key cause of cluster creation in the fact that companies appreciate it that such solutions generate knowledge. There are even instances of creating a "community of practice", characterised by its own identity and certain specificity (Brown, Duguid 2001). By operating within this "community", companies develop their know-how and, thanks to the relations existing among them, share tacit knowledge with each other. Cluster-level knowledge is similar to industry routines, recipes for success and how to perform particular activities (Spender 1989). While studying Taiwanese high-tech companies, Tsai (2005) found that intra- and inter-industrial spillover effects in the field of R&D have a greater significance from the viewpoint of production growth than individual companies' efforts in the field of R&D do.

2.2. Interactions as a manifestation of relations among cluster members and their significance for company competitiveness

With reference to the second kind of influence which a cluster has on its member companies' competitiveness, it can be stated that the consequences of spillover effects are accompanied by implications arising from the fact that companies enter into relationships. Therefore, rivalry and co-operation among companies within a cluster can act as a corrective mechanism for their competitiveness. This thesis is clearly inspired by Porter's opinion that the company's immediate environment, particularly the relations among companies in geographical proximity, are of great importance for the competitiveness of an organisation.

An interesting interpretation of external sources of competitive advantage was put forward by Dyer and Singh (1998), who attempt to endorse what is called a relational approach to competitive advantage. In their opinion, relations among companies are increasingly often a source of above-average profits. The analysis which the two authors conducted suggests that resources which are crucial for gaining a competitive advantage may lie in routines and processes developed among companies. Their approach is a continuation of earlier research focussed on the issue of companies' co-operation as a method of getting economic benefits in such forms as the acquisition of knowledge and skills, i.e. learning from others, lowering transaction costs or having access to certain resources (Hamel 1991, Larson 1992, Powell, Koput, Smith-Doerr 1996).

Asanuma (1989) was one of the first researchers to demonstrate how capabilities rooted in relations among existing companies affect competitiveness. Using Japanese suppliers and car manufacturers as an example, he explained how these relations led to the co-operating companies' financial surpluses and competitive advantage. Saxenian (1994) found that Hewlett Packard and other Silicon Valley companies considerably improved their position by developing long-term relations with suppliers located in geographical proximity. Dyer (1996) pointed to a positive relationship between suppliers and car manufacturers investing in the construction of a network of relations and their market position. Many researchers also demonstrated that physical proximity, which is connected with companies making investments in certain locations, stimulates co-operation and co-ordination among companies, thus improving their competitive position (Enright 1995).

3. POLAND'S EXPERIENCES WITH REGARD TO CLUSTER INITIATIVES

Interest in cluster issues can be observed nowadays not just in the "old" but also in the "new" EU countries, including Poland. However the OECD states that nothing has been done in Poland to promote clusters (OECD 2005, p.5).

In 2004, under the auspices of the Competitiveness Institute, research was carried out into cluster initiatives on a global scale. The research results were presented in the "Green Book of Cluster Initiatives". The list of 238 undertakings of this type which were investigated in 2003 featured one from Poland – Tarnów Industrial Cluster "Plastic Valley". In Poland, it is the Institute for Market Economics (IBnGR) that has devoted a lot of attention to clusters. As early as 2002, the Institute launched a research project to study and determine the possibility and method of exploiting the economic cluster conception with a view to increasing the competitiveness and innovativeness of the Polish economy. The research managed to identify an industrial automation quasi-cluster in Gdańsk, a printing cluster in Warsaw and a construction cluster in the Świętokrzyski region. The beginnings of a cluster structure can also be found in the Warsaw agglomeration, in industries such as farmaceuticals and cosmetics (NACE 24.4, 24.5 and 73.1), electronics, information technology, and telecommunication. These industries require access to well-qualified labour and a technologically advanced scientific base, which justifies their concentration around Poland's capital.

As for the industrial automation quasi-cluster in the Gdańsk region, this grew next to the shipbuilding industry, which accounts for a large proportion of Pomerania's exports (Szultka, Wojnicka 2003). Shipyards' core activity seems to have given rise to a sector of companies dealing with industrial automation - approximately sixty companies in all, nearly half of which (22) are manufacturing firms, 19 provide only services in the fields of design and implementation of industrial automation systems, another seven are manufacturing and services firms, and nine are strictly trading firms. The industry employs about 2,200 people. A great majority of the firms are SMEs (only some of them are micro-firms employing up to 10 people) – only two firms employ more than 500 people.

Results of a questionnaire concerning the work of industrial automation companies in the Gdańsk region show the positive attitude of these institutions towards co-operation. Within this quasi-group we can observe the formation of new firms ("spin-offs"), which is conducive to the cluster's specialisation and increasing self-sufficiency. As a result, these companies maintain a high competitive position which gives them the capacity to compete with strong international companies in the Polish market; in the recent years they have been increasingly often entering foreign markets with their products.

One pro-cluster initiative seems to be the move made by aerospace industry entrepreneurs: on 11 April 2003, they set up the Aviation Valley Association of aerospace-industry entrepreneurs (http://www.paiz.gov.pl/index/?id=955cb567b6e38f4c6b3f28cc857fc38c). The majority of companies involved in the project are situated in the Podkarpackie province. The main aim of Aviation Valley is to transform south-eastern Poland into a leading European aerospace-industry region which will provide the most demanding customers with various aerospace-industry products and services. At present, the Aviation Valley Association consists of 36 members based in the region; other candidates are going through the application process. Within the next few years, the association intends to increase the number of members to 100. Last but not least, a study carried out by IBnGR has shown that there is a concentration of furniture companies in the region of Wielkopolska. Findings concerning this cluster will be presented in the next parts of this paper.

4. FURNITURE CLUSTER IN THE REGION OF WIELKOPOLSKA

4.1 Findings to date

The empirical research conducted by the present authors among members of the furniture cluster in Wielkopolska was preceded by relevant literature studies. The Polish furniture industry is considerably diversified in terms of size, form of ownership, and organisational structure (Zarzycka 2005, p. 390). In 2001, as many as 93% of approximately 23,000 businesses were micro-firms. However, the 15 biggest entities accounted for 75% of the sales value. The private sector's share was 95%, while the share of companies controlled by foreign capital amounted to 50%. In its analysis of clusters' potential and development opportunities, IBnGR identified a concentration of furniture-industry businesses (Report about SME, 2001, p. 223-224).For the purposes of the above-mentioned research, IBnGR used the location quotient (LQ)[1], which in Poland was found to have reached the highest value (1.25) in the Wielkopolska province, which is proof of high concentration and specialisation in this field (Report about SME, 2001, p. 223-224). The furniture sector shows clear connections with raw-materials industries and with industries horizontally connected with timber processing. On the basis of statistical analysis, IBnGR found that at the county level the location of furniture-industry companies (NACE 36.1) is clearly and positively correlated with the location of companies representing industries from lower levels of the value creation chain (NACE 0.20 – forestry and logging). Wielkopolska's furniture cluster is made up of furniture companies which, in the field of R&D, co-operate with the Wood Technology Institute of the Poznań University of Agriculture, REMONDEX (a furniture-industry development institute), the Poznań Academy of Fine Arts, and Poznań Technical University. An important role in the cluster is played by the Poznań International Fair. The cluster has an enormous development potential, which results from the furniture industry's outstanding export performance and its extremely positive impact on the volume of Polish exports in general. Information available at the Wielkopolska Centre for Interregional Economic Co-operation, affiliated to the Marshal's Office in Poznań, suggests that companies appreciate the significance of co-operation for improvement in their innovativeness.

Evidence of the existence of a furniture cluster in Wielkopolska includes not only a concentration of the above businesses but also the presence of large, pre-1989 furniture companies which have been divided as a result of economic restructuring. The Wielkopolska region's furniture industry is dominated by micro-firms, which also seems to prove the existence of a pro-cluster environment in the region. Since 1990, this dominance has been clearly visible especially in Wielkopolska's district of Swarzędz. The structure of Wielkopolska's furniture industry, which makes the region a suitable location for a furniture cluster, results from several facts (Stryjakiewicz 1999, p. 153):

---

[1] The Location Quotient has been calculated using the formula $L = \dfrac{A}{B} : \dfrac{C}{D}$, where A – employment in the furniture industry (NACE 36.1) in a given region, here in Wielkopolska, B – total employment in the whole region (here in Wielkopolska), C – national employment in the furniture industry (NACE 36.1), D – total national employment. The employment figure can be replaced with the number of companies, sales revenue, export revenue or net profits. If LQ=1, then a given region, here a province (voivodship), has the same share of employment in a given industry as the national economy does. LQ>1.25 is usually seen to indicate a given region's specialisation in a certain industry. The quotient enables the identification of locations with an above-average concentration of businesses in a given industry.

- weakened competitiveness of businesses in Swarzędz, caused by Poland's furniture industry being taken control of by German investors (we have also seen an inflow of Swedish, American and Swiss capital to the Polish furniture industry),

- increase in timber prices, caused by a higher demand for this raw material and higher imports of the material,

- chance to activate the district of Swarzędz through the development of SMEs, whose activity would be based on tradition, experience and existing connections in the value-added chain.

The local carpentry tradition "goes back to the seventeenth century, and its strongest development took place in the nineteenth century". According to Stryjakiewicz, the characteristic features of the furniture-company cluster in the Swarzędz district are:

- high specialisation within sections,

- high quality of products,

- flexibility to meet customer needs,

- manufacturers' good skills,

- presence of a local entrepreneurship culture.

In spite of this, the early 1990s saw a slump in exports, then in production, which forced companies to limit their production capacity. This was an effect of increased foreign and domestic competition, and of using the wrong development strategy. The strategy was based on an extensive range of traditional products, an own distribution system, and expensive logistics. The network of connections with the environment was developed only to a small extent. Therefore, the development of a cluster initiative in the region seems to be particularly valuable. These needs are met by the initiative named "Support for the Development of the Wielkopolska Furniture-Industry Cluster", implemented as part of the Integrated Operation Programme for Regional Development 2005-2007, and financed by the European Social Fund. The project is conducted by Wielkopolska Agencja Rozwoju Przedsiębiorczości Sp. z o.o. (WARP, or Wielkopolska Entrepreneurship Development Agency). WARP acts as a cluster "broker" responsible for communication and initiation of new projects. So far, WARP has created a database of information about Wielkopolska's furniture companies, selected furniture-industry suppliers and purchasers, research and development centres, and schools (secondary and tertiary) related to the industry. It has also established contact with approximately a thousand firms, provided them with promotional information on the project, and sent them a questionnaire concerning the cluster initiative. Thirty-seven businesses returned the questionnaire, declaring participation in the cluster initiative.

4.2. Empirical research among members of the furniture-industry cluster

4.2.1. Object of research

The furniture-industry cluster also became an object of the present authors' research.

In the present paper, the authors focus on the significance of cluster-membership for the competitive potential, competitive position and competitive strategy of the companies they investigated in the furniture industry, as well as in related and supporting industries.

4.2.2. Research method

The empirical research into the role played by clusters in supporting international competitivenes and the internationalisation of Polish companies, in particular Wielkopolska's furniture-industry cluster, was carried out in July and August 2006. The main criterion for sample selection was first of all a company's location in the region of Wielkopolska and second, its activity. A key factor was company representatives' consent to participate in the research. The most important thing was to select companies which are based in Wielkopolska and which operate in the furniture industry broadly understood, and in supporting or related industries. Another requirement was for the research to involve companies whose activity covers different links of the value chain: providers of raw materials and components, producers of finished goods, companies dealing only with marketing or the sale of certain products.

An address list of potential questionnaire respondents was prepared in conjunction with the Wielkopolska Entrepreneurship Development Agency (WARP).

The selection criterion for industries to be included in the research was that they should be industries with observable co-operation and internationalisation tendencies, because activity in the international market, which in addition to the domestic market also includes foreign markets, is a test of the company's international competitiveness. When selecting companies for the research, the authors used the most typical case of non-random sampling – deliberate selection, which consisted in a rather formal and subjective selection of items for the sample, with the hope of obtaining information that is as detailed as possible. Above all, company selection was determined by practical considerations – belonging to the industries selected for the research, and company location. The company-selection method that was used has an impact on the interpretation of the results obtained. The sample size (31 companies) and the sample selection method prove its low representativeness. Therefore, the research results cannot be generalised to refer to the whole population since they describe only the situation within the group of companies investigated.

In the research, the authors used the individual in-depth interview method. Selected pre-trained people (students and academics) conducted interviews using a previously developed questionnaire, which was a basic research tool during the interview. Having conducted the interviews, the research team and the interviewers checked the formal accuracy of the completed questionnaires.

In the next stage of the research, the raw data in the form of completed sheets were subjected to encoding and statistical processing.

4.2.3. Questionnaire
